It is with the name of Ghirlandaio that the portraits in this gallery begin. No. 188—a full face of a grave, stout citizen in close red bonnet, with a little son at his side looking up in profile, and a careful landscape behind—is assigned to that master, and is rather adventurously called "Portrait of Count Sassetti, patron of the painter, and his son." Florence had no counts in those days, and Francesco Sassetti was a Florentine citizen like any other. He it was who commissioned Ghirlandaio in 1485 to paint the famous series from the life of St. Francis, still existing in the church of Sta. Trinità, and whose noble portrait kneels in that place opposite his wife Nera, "*conjug. dulcis. cum qua suaviter vivit.*" I do not know whether this panel has any pedigree, or has been simply named by the dealers from a certain likeness of the sitter to the kneeling citizen of Sta. Trinità. That likeness is not enough by itself to justify identification. But whoever the sitter is, and whether the portrait is from the hand of Ghirlandaio, or, as I should suppose more probable, from that of his pupil Mainardi, it is a good example of the style; the child's head charming; and the injuries not excessive. Two other Italian portraits, of a striking aspect in spite of injury and repair, are numbered 170 and 186, and respectively given to Beltraccio and Giovanni Bellini. Some collectors would not have scrupled to put the rare name of Antonello de Messina to a head of the character and treatment of 170. The other is, by its background, quite in the manner of Bellini or Basaiti. But if we are to stop at Venetian portraits, let it be at the two noble Tintoretts lent by the Duke of Abercorn (123, 129). One after another, as the grave merchants of the ruling caste came to their turn of office in the State, they would pass before the easel of the master. One wonders how long the fiery hand took in turning out an official portrait of this kind. Not longer, certainly, than Reynolds took to his airiest and slightest play with the countenance of a fashionable sitter. But what a difference between the workmen! How fragile, perishable, uncertain, the graces of the one; how solid, triumphant, enduring, the splendour of the other! Reynolds beside Tintoret is a dewdrop beside a diamond. There is this comfort in the hiding away of Italian pictures in English country-houses, that they generally keep much better there than in the galleries of their home. Both of these portraits of Tintoret are well preserved, No. 129 quite perfectly; and by them we may know what all his portraits would be like but for the layers of coarse restoration which, in Venice, have passed over too many of them. A mighty grasp and sincerity of character; ruggedness with dignity; every crow's foot about the wary eye, every hair of the grizzled beard, laid down, hurled down rather, with a certainty so swift and so unerring that its one fault is to seem sometimes almost mechanical; vigorous relief, colour gorgeous in light, solemn and transparent in shade. For colour, indeed, No. 129 is one of the most surprising things that can be seen. The crimson

robe of stamped velvet has that quality which one but Tintoret ever achieved; to flash so soft at the same time is the privilege of crimsons and purples of his shade with rich red wine and nothing else in the world.

What, then, shall we say of the picture that next but one to this, No. 132? It is the work of a different school, and painted in different days. From the opposite side of the great room Venetian pictures along this wall look all so different and splendid; this Spanish picture looks all so different and silver; but somehow the Spanish picture of a force to dim even the Venetian. A Velazquez than this of the Duke of Abercorn not been seen in any of these exhibitions. I do not know its history. It would seem to be a portrait one described by Sir William Stirling-Maxwell as existing and numbered 308 in the Royal Museum at Madrid. Don Balthazar Carlos, the son of the coloured round-faced boy whom we are accustomed to see caracoling in the manege, is in the three pictures in our own country, stands at full length in a hall opening on a landscape. The little man is booted, gloved, and hatted, wears a dark green suit stiff with gold, and holds in the muzzle with his right hand a short staff, which the butt rests on the ground. Above the hound watches half-asleep beside him with a heavy face laid along the ground, two small grey hounds sit, all eagerness, behind. It is the regard of reality, and that without ostentation or toil. The strokes and spots of colour, which are close to them, look all confusion; but the face and there is the living frame of the boy, sturdy and alive in his suit of green and gold, the gold an incredible subtlety and sobriety in variety; in the expression of the different features an intense truth of character, rendered with more or three weighty and perfectly calculated touches of the brush; and then a wild landscape full of romance, full of silver light and azure and ending in a range of dark sierras that can scarcely distinguish from the clouds above them. The only drawback is the curtain which seems in the way both as to colour and position. The other Velazquez lent by the Queen, a court portrait, it is to the full as potent in my mind less delightful (121).

Another school had engaged in the physiognomy in another, though not less noble way. I mean the German school. The work of Holbein has something in its stern patient in its deliberate profoundness and exactness, corresponds to the Northern character, and contrasts with the more imaginative and capricious methods of the Southern schools. Of Holbein there is here only one rather poor example, Lord Yarborough's portrait of Edward VI. There is an admirable example of an almost unknown Englishman, John Bettes, working under his influence (175). And then we leap a few years, to the days of that rage for portraits in the great families of England which began with the residence of Vandyck among us. These great ancestors and ancestresses are here too numerous to speak of in detail. I will only refer to two of them—the likeness of James Stuart, Duke of Richmond and Lennox, and the *Portrait of an Artist*—as extraordinarily good works of the master, and among the very best portraits in the world. If the painting of dogs in the Velazquez is masterly, and the expressions full of life, still grander is the head of the portrait of James Stuart, seated in a shortening which makes the most of the length and springy straightness of his face, and pressing up his head and long fine muzzle to meet the caress of his master's hand. Of the dog is the nobler animal, for no other spirit in the painter, no brilliancy of his pen can make an agreeable type out of the man. To be chivalrous and brilliant is natural to Vandyck, but it is only at his happiest that he is so solid and careful as in this work, and in the work which I have named. Who the "Artist" is

remains unknown, nor does an engraving which exists after the picture help us. Very possibly he may not be an artist at all; the antique bust on the table is the only appurtenance which proclaims him so; the compasses in his hand would do as well for a geometer, the globe for a navigator or astronomer, the flute for a musician, or what you will. What distinguishes the painting, besides the admirable vivacity and character common to this as to all good Vandycks in the head and hands, is the beautiful and careful painting of these accessories, and their exquisite treatment, together with that of the curtain behind the figure, for the scheme of light and shade in the composition.

The immediate succession of Vandyck in England is doubtfully represented by No. 201; which can hardly be by Lely as it is said to be, and assuredly represents, not Monmouth whom it is said to represent, but Charles the Second. Lely's degenerate successors, Kneller and the Englishmen formed by Kneller, find no place, as indeed they deserve none, in the company of the great masters. That Hanoverian age is barrenness at first. But we soon find an Englishman formed by himself, who deserves as honoured a place as any one. It is only in quite late years that criticism has come to acknowledge how complete a master Hogarth was; how thoroughly, in everything he sat down to, he knew what he wanted, and with what workmanlike simplicity he compassed it, almost always, like a very few masters who had gone before him, at a single painting. In this portrait of Miss Fenton as Polly Peachum (137), as in all Hogarth's portraits, there is no faltering and no shortcoming. The merry rosy face is painted with absolute simplicity and refinement; the little harmony of white and brownish yellow and green in her frills and dress is charming and characteristic; the whole spirit of the age has passed into the picture. Still more interesting is the sketch of the Shrimp Girl (31). (Sir William Miles is the contributor of both). I think of this as a portrait, though by its spirit of fun and character it may rank rather as a study for one of his social grotesques. But what charm, as well as what fun and character! Momentary expression has been so over-cultivated by our later school, that one is predisposed against work of which it is the aim; but even a broad grin is a sight to be grateful for when it is so brilliant and full of life and free from vulgarity as this of the Shrimp Girl; and, above all, when it is accompanied by such a magical light in the eyes, and such an exquisite tone in the shadowed forehead beneath the hat. The thing is a sketch, as I have said, and thin; but enough to rank any painter a master. A third portrait put down to Hogarth, I should say (unless family tradition is quite decisive on the point) was not by him. This is the likeness of the Hon. J. Hamilton, lent by the Duke of Abercorn (212). It is good and has vivacity, but is not in the manner of Hogarth. With the aforesaid reservation, I should put it down confidently to Knapton, a painter of the Hudson school who was better than the rest, and not quite without some of the vivacity of Hogarth and some of the grace of Reynolds: both in composition and method of painting this picture is altogether like Knapton.

And with it we come to the greater name of Reynolds. The same sitter, I believe, is represented in the *Hon. Captain Hamilton*, also lent by the Duke of Abercorn—an early costume portrait which does not count for very much in the history of the master. On the whole, this is not a very good year for Reynolds. There is more than a common proportion of his careless or ruined work. Thus the two pictures lent by the Dowager Countess Cowper, one from the beginning and one from the end of his career, interesting as they are, have an interest that is chiefly melancholy. The early picture, with the portraits of the little Ladies Amabel and Mary de Grey (139), has altogether lost its carnations. These are

the ghosts of girls, and their nimble movement and smiles make their ashen colour look all the more strange: the only part that is well preserved is the leaping poodle that follows them—a marvel of dexterous play with the brush. The pendant of three boys (144), one of them the son of the little Lady Mary in the last, is damaged in another way. It has been cruelly cracked and more cruelly restored, and the pretty actions and brilliant composition are all of which we can now be aware. Another case of decay, though less complete, is the well-known and beloved little lady in the snow with her big hat and muff—the Duke of Buccleuch's *Portrait of Lady Caroline Montague Scott* (43). Here the accessories of snowy landscape and robin-red-breast, the sweet quaintness and heartiness of the child, half troubled at the nipping cold and half amused with herself for minding it, have all the charm one would have gathered from the print; but in the face the half-tints have gone, so that the roses of her cheeks have become exaggerated, almost like harlequin's patches, upon the white. If we were to point to the two Sir Joshuas here that are best preserved, they would be Lord de Clifford's *Portrait of Colonel Cousmaker* beside his great charger (159), and Lord Castletown's *Portrait of Lady Gertrude Fitzpatrick*, better known as *Collina* (73). The first is not an interesting subject, but is redeemed not only by its perfect preservation, but by a singular excellence in the accessories. Reynolds was apt to leave these things to assistants; but I think that no hand but his own could possibly have put such colour and quality into this noble charger's head; still more, into the stem of this birch-tree against which the red-coated soldier leans, and which with its black and tawny and silver stains has the splendour of a serpent. What strikes one about the *Collina*, over and above the happy dignity of composition (a scheme Reynolds has repeated more than once) which places the little maid alone on a knoll against the sky, is the disproportion of the pains spent upon the head and upon the rest of the figure, and the tact by which we are prevented from feeling that disproportion. Nothing can be more exquisite in finish than the shy countenance and curly crown; it is one of the most highly wrought things in all Sir Joshua's work; nothing can be much emptier or hastier than the dress, the arms and hands; and yet, by some subtle artifice of keeping, one does not feel this, one only sees it on examination. But it is impossible to discuss all the Reynoldses in detail: especially when it is Reynolds's great contemporary Gainsborough, this year, who is better represented than himself.

The Exhibition contains at least three unsurpassed portrait-pieces of Gainsborough. First, *The Sisters*, bought for what seemed a fabulous sum last year at Christie's, and now the property of Mr. J. Graham. The surface of this brilliant work has no doubt gone a little browner than it was meant to be; otherwise it is intact; and the picture has all the charm of the famous Linley sisters at the Dulwich gallery—all the radiant life and sparkling tenderness and high breeding of those women who smile out beneath their tall head-dresses and from amid their dainty muslins, as they caress each other or walk alone in front of a background boldly smeared in to represent the family park and shrubberies. Next, the equally uninjured portrait of Mr. Lowndes Stone, an auditor of the Court of Exchequer, at the age of eighty-three (40). This was painted just before Gainsborough left Bath, and is in a key of colour unusual with him: the sitter wears a coat of a warm brown, and there is a warm red curtain behind him. It is touching to note how Gainsborough's vigorous manly powers have grasped to the life the weakness of old age and its resistance to weakness. The lights in the eyes are bright, but small and beady: the mouth is toothless and shrunk, but with the lips set firm; the hands doubled with a set firmness over the cane-head; weakness in the posture of the knees, but no yielding; an

upright seat, a keen outlook; wig well kept, and cuffs and collar of the fairest white. The little spaniel beside his old master's side is a miracle of life and dexterity. By a curious contrast of age and youth, the other best Gainsborough here is a portrait of his own two children, Peggy and Mary—the lovely girls that grew up to give not a little uneasiness to their father. He painted them many times over; surely never more brilliantly than here. I believe the two heads have been separated and brought together again as we now have them; together at any rate they belong. One sister has not been sitting nicely; the other puts out her arm and catches her by the hair above the forehead, with a "Come, lift your head up;" and this gesture is expressed with a vivacity, a delicacy, that nothing can exceed. The arm is only sketched, the background is a mere play of the brush for the sake of pleasant colour; but such a play as a Venetian might envy; for instance, if you want to be happy over the very poetry of colour, look at that lovely passage where the pink and purple of one girl's hairband and the blue of the background come together. In the midst of one's delight, one feels half provoked with the genius that draws results so precious from means so uncertain, so unsound; one half resents the power of these gifted smearers to beat a ten times better workman, Hogarth, and to rival the greatest schools of old. The painting is an example of those "curious strokes and hatches" which Reynolds criticised in Gainsborough; the brush has gone straight backwards and forwards as in the drawings of some masters: but the result is a flesh painting of astonishing purity and tenderness; these cheeks and lips are all alive with the rosy blood, these temples and lean young throats and shoulders all tenderly shaded with the blue: it may be provoking, but it is beautiful and a marvel. Other Gainsboroughs only a little less admirable are the portraits of the Duchess of Montagu (156), and of Tickell (231). But it is time to close; taking leave of our great native school of portrait with a look at the Romneys, of which there are several. No. 29 is an interesting portrait, both by the quaintness of the fashion and the beauty of the sitter—Mrs. Wells, the actress (29); but it is not free from that heaviness which was Romney's besetting fault in his highly finished work. Of work less highly finished, there are two exceedingly happy examples: Nos. 206 and 213 in the fourth gallery. Lord Carlingford's picture (No. 26) I do not think genuine.

SIDNEY COLVIN.

MESSRS. AGNEW'S WATER-COLOURS.

AN "Exhibition of Selected High-class Water-colour Drawings" (as the catalogue has it) will be held for a few weeks at Messrs. Agnew and Sons' premises, 5 Waterloo Place—Monday last having been the opening day. Messrs. Agnew do not, as a rule, lay themselves out for the more intellectual water-colours, or those of the most advanced artistic style, produced by living painters; but their gallery contains some very fine works of past date. The noble large-sized Turner, *View near Fonthill Abbey*, exquisite in atmosphere, and sumptuous in its sunny orange-brown tone, is worthily companioned by two truly great examples of Cox, *Gathering Blackberries*, and *A Lamb bleating over a Dying Ewe*. These large works (smaller, however, than another but far inferior Cox, *The Junction of the Llugwy and the Conway*) show the master at his very highest; intense in sentiment and perception, impetuous and arbitrary in handling, commanding in colour, and full throughout of that vital force which defies or baffles analysis. There is also an important De Wint, *View of Lincoln*, and some clever pen-and-ink sketches by Landseer. Works by living artists that have been seen before, and bear being inspected again, are—*The Tramps* by Pinwell, *The Fruit-stall* by Birket Foster, and *John the Baptist before Herod* by Houghton.

The following are new to us:—*Waning Light*,

J. Knight, a fine work of tone, with something not unlike Millet in feeling; *On the Eve*, J. W. North; *The King of Beasts*, *A Dancing Bear*, and *A Cairo Donkey-boy*, Heywood Hardy—all able works, and the last noticeable for exact finish; *A Street in Rome* (not *Naples*, as in the catalogue), N. Cipriani, with a barber operating *al fresco* hard by the Temple of Vesta, very cleverly done, but less tastefully than cleverly; *Apollo*, Briton Rivière, a water-colour of the same composition which had been already exhibited in oil-colour, not very satisfactory in point of execution; *The Dead Sea*, H. A. Harper, large and striking; *The Two Ducks*, F. W. Burton, a little girl carrying a drake, her face very arch and living in expression (perhaps this has been exhibited before); *The Music Lesson*, Simonetti, a skilful specimen of the class of work founded on Fortuny's style; *Wagner's Walls and Telford Meadows*, two river-scenes treated pleasantly and efficiently, if also rather coldly, by William H. Millais, the brother of the Royal Academician. The total number of works is 148. W. M. ROSSETTI.

ART SALES.

A SALE took place on the 20th of last month, at Grantham, of the collection of Mr. Hawkins, for many years a zealous collector of British pottery and porcelain. Almost every manufacture was represented by choice specimens, those of Derby especially being of remarkable beauty. Some of the prices obtained were as follows:—A Nottingham bear beer jug, 3*l.*, and another with a bear holding a monkey, 2*l.* 16*s.*; a ball, used as a rattle, of the same manufacture, dated 1769, 3*l.* 15*s.*, and a puzzle jug, also dated, 2*l.* 18*s.* Wedgwood cream ware coffee pot, with transfer garden party, 4*l.* 5*s.* Some of the Staffordshire figures sold—*Atlas*, 2*l.*; *Diana*, 1*l.* 16*s.*; *The Cobbler and his Wife*, 3*l.*; busts of Wesley and Whitfield, signed by Enoch Wood, 4*l.* 5*s.* and 6 guineas; *Shakspeare*, 3*l.* 10*s.*; an early three-handled posset pot, date and inscription, 5*l.* 5*s.* Chelsea jugs with exotic birds, 9½ guineas and 10 guineas; group, *Summer and Winter*, 15 guineas; *Neptune*, 13 guineas; pair of pastoral figures, 35 guineas; *Justice*, a fine figure, 13½ guineas; *Britannia*, 15 guineas; *Fame*, 10 guineas; an oviform vase, gold and white stripes, 50 guineas. Chelsea-Derby, a two-handled chocolate cup, 8 guineas; cup, with anchor under the crown, 6 guineas. Crown Derby, two-handled cup, fluted blue and gold, 8½ guineas; the "Hutchinson vase," with peacock and exotic birds, 9½ guineas; vase, with painting of Holy Family by Askew, 12½ guineas; a spill vase, painted by Haslem, 16 guineas; group of Four Quarters of the World, 18½ guineas; Garrick as Richard III., 5½ guineas. Of the biscuit groups for which Derby was so renowned: *Four Seasons*, 10*l.*; *Bacchante adoring Pan*, 12½ guineas, and *Two Virgins awaking Cupid*, 8½ guineas, both modelled by Spangler; *Fire*, 5½ guineas; *Music and Poetry*, a pair 13½ guineas; a fine figure of Wilkes, 7½ guineas; *Mrs. Macaulay*, the companion, 7½ guineas; *Infant Hercules*, 8½ guineas. Cocker's little biscuit figures sold from 10*s.* to 30*s.*; Worcester jugs from 10 to 15 guineas; teapot, blue scale, and square mark, 18 guineas; sugar basin of the same set, 10½ guineas; mugs, 8 to 10½ guineas; cups and saucers, Japanese pattern, 6½ guineas; pair of vases, exotic birds in medallions on blue ground, Dr. Walle's period, 90 guineas; and one, Flight and Barr, *The Death of Dido*, 27½ guineas. A Plymouth coffee pot, 12½ guineas, and figure of a musician, 12 guineas; pair of Pinxtion jardinières, 6½ guineas; Nantgarw pen-tray, 7*l.* 16*s.*; and a plate, painted with flowers, 6½ guineas. The sale produced 2,974*l.*

On the 3rd inst. Messrs. Christie, Manson and Woods had a sale of English porcelain. A fine old Worcester plate, with exotic birds and butterflies, with deep blue and turquoise grounds, sold

for 24½ guineas; fluted bowl, 17 guineas; two large Worcester coffee cups and saucers, 13*l.* and 17*l.* Of a Worcester tea service, scale pattern ground, the teacups and saucers sold from 4 guineas to 8*l.* 5*s.* the pair, the teapot 8*l.*, and sugar basin 4 guineas. Pair of Chelsea figures, Shakspeare and Milton, 12*l.*; and a Crown Derby dinner service, 50*l.*

THE most important sale of English china of the season, advertised by Messrs. Christie for March 15, will be that of the collection of Mr. H. Bohn, one of the finest and most comprehensive in the kingdom. Mr. Bohn has for many years been first in the field among collectors, and his specimens have the great characteristic of genuineness, a recommendation of the highest value in these days, when Chelsea bosquets, bee jugs, and King of Prussia transfer are so extensively manufactured, and Chelsea anchors affixed, serving thereby to deceive the unwary and mislead the inexperienced.

NOTES AND NEWS.

WE regret to hear that the eminent artist M. Corot is lying ill in Paris.

MRS. NOSEDA has just published an important line engraving by J. Outrim, whose reputation as an engraver is sufficiently known. It is from Mr. Watts's portrait of Sir Antonio Panizzi, than which no work of the great contemporary portrait-painter has been more strongly or justly admired. The portrait is undoubtedly among the more remarkable of Mr. Watts's works, nor has the engraver failed in his task of translation.

MR. FREDERICK BRUCKMANN will shortly publish an engraving of *La Madonna di Tempi*, after Raphael's famous picture in the Royal Pinakothek at Munich, by J. L. Raab, Professor of the Royal Academy at Munich.

THE same publisher is preparing a series of photographs of the Arctic regions, after sketches made by Lieutenant Payer, of the late Austrian expedition, known as the Payer-Weyprecht Arctic Expedition.

The magnificent painting by Meindert Hobbema which formed one of the *chefs d'œuvre* of the collection of the Marquis d'Abzac was not sold, it is affirmed, with that nobleman's other paintings.

THE exhibition organised at Bordeaux by the Société des Amis des Arts will open on March 1.

In the *République Française* for January 22, there appeared an interesting account, to which we ought to have done justice more immediately, of the operations of the Society for Japanese Studies (*Société des études japonaises*), which was formed in Paris at the close of the International Congress of Orientalists in 1873. The initiative of the movement is ascribed to M. Léon de Rosny. Beside two *Annuaire*s, the Society has just produced a *Compte Rendu* of its transactions in a handsome illustrated volume issued gratis to subscribers, and on sale to the number of fifty copies (at what price we are not told), by the house of Maisonneuve. The writer of the notice gives an analysis of the contents of this volume; of which the principal are—a paper by M. Léon de Rosny on the Oldest Monuments of Japanese Civilisation; another by M. de Zelinski on the Names of Colours in Japanese; a translation by M. Fr. Sarrazin of a treatise written by a Japanese, Fulu-Yen, on the coinage of his country; an important memoir by M. Longpérier on the dates and relative antiquity of the most archaic order of Japanese bronzes; a study of the primitive, pre-Buddhistic religion of Japan, by M. Emile Burnouf; and finally a few words by a French official in Japan, M. du Bousquet, in justification of the recent revolution in the State Church of the country. The writer adds that the Society is about to publish a second volume of *Comptes Rendus*, as well as the translation of a (non-official) native history of the

country. He testifies to the interest taken in the work of the Society by some of the young Japanese students and envoys in Europe. The Society contains members of different countries, and is open "à tous les japonisants qui ont la passion sincère du japonisme." The writer suggests that its meetings would be improved by greater regularity as to place and time, and by a less exclusive attention than is sometimes given at them to purely philological questions. He concludes with some very just remarks on the necessity, at this juncture of all others, of bringing all appliances of criticism and investigation at once to bear on the mythology, the traditions, the arts of that unique civilization which seems in the act of dissolving and changing its character at contact with European influences.

A LARGE and important painting by Meindert Hobbema, representing a Dutch town, is now being exhibited in the art-galleries of the Herrn Miethke, at Vienna. It belongs to the painter's best period, and is ranked by connoisseurs with the well-known "Avenue" in the National Gallery. It is rumoured that this picture comes from a private collection in England, and that it will be secured for one of the public galleries of Germany, few of which are rich in works by this master.

ANOTHER fine art exhibition for the benefit of the natives of Alsace and Lorraine who have emigrated to Algeria, will be held at Nancy in the summer of this year. One of its principal features will be a collection of American antiquities, organised more especially for the congress of American *savants* that will meet at Nancy during the period of the exhibition.

ANOTHER election will shortly take place at the Académie des Beaux-Arts, to fill the place of M. Pelletier, lately deceased.

THE *Gazette des Beaux-Arts* opens this month with a long article by Léonce Mesnard, on Luca Signorelli and his frescoes in the chapel of San Brizio at Orvieto. It does not add much to the knowledge that Messrs. Crowe and Cavalcaselle have already collected concerning this painter, but students will be interested in a large-sized etching of the two grand angels in the "Paradise," a fresco in the cathedral of Orvieto, of which there is an outline illustration in the *History of Painting in Italy*. (2.) A biographical and critical account of Jean Louis Hamon, who died in May of last year. Hamon was educated as an artist under Delaroche and Gleyre, but his classical proclivities are unmistakable in the numerous illustrations given from his works. His *Théâtre de Guignol* is conceived quite in an ancient vein of satire. (3.) "Un Amateur Parisien du XVI^e siècle" reveals a certain Nicolas Honel, an apothecary of Paris, who in 1570 wrote a series of sonnets adorned with twenty-nine drawings in *bistre*, in celebration of the virtues of Catherine de' Medici, then Queen Mother of France. The book is dedicated to this "très-vertueuse, très-illustre et très-excellente Princesse," and, strange to say, has been preserved to the present day. It is now in the cabinet of prints of the Bibliothèque Nationale. (4.) "The Symbolism of Fire" as represented in the Homeric mythology by Hephaistos, and in the mythology of Hesiod by Prometheus, is traced in its various expressions in art by Louis Ménard. The Creation of Man by Prometheus is a subject often represented on sarcophagi, and the whole symbolism of fire, especially in the form of the fable of Prometheus, taught, according to M. Ménard, the immortality of the soul, and prepared men's minds for the Christian doctrines of the Fall and the Redemption. The other articles of the number are—a continuation of "Murillo and his Pupils," by Paul Lefort, illustrated by an etching by Walther from the *Divine Shepherd* of Madrid, and a woodcut of the mutilated St. Anthony of Padua; a notice of the Exposition de Lille by Alfred Darcel; and of the Musée de Lyon, by

Eugène Véron; and a short history of the French sculptor Clochon, whose real name appears to have been Claude Michel, by René Ménard.

THE *Zeitschrift für bildende Kunst* has certainly in one respect an advantage over its French contemporary. If learning bears any proportion to ponderosity, then it must be admitted that the German *Zeitschrift* is far more learned than the French *Gazette*; but it is possible to be heavy without being learned, and this we are afraid is what the *Zeitschrift* occasionally accomplishes. In the current number we find (1) a continuation of Iwan Lermolieff's long critique on the Borghese Gallery, translated by Dr. J. Schwarze from Lermolieff's *Galleries of Rome*; (2) the conclusion of Krell's article on "Stuttgart's recent Activity in Building;" (3) a descriptive catalogue of the architectural drawings in the Uffizi collection (*Baugeschichtliche Mittheilungen aus der Handschriftensammlung der Uffizien*), by Rudolf Redtenbacher; and (4) The Technic of Italian Miniature painting. This last article is interesting, for it makes known a manuscript in the National Library at Naples which gives a clear description of the whole process used in miniature painting and illuminating. The author of the manuscript is not known, but its style and the characters in which it is written appear to place it in the thirteenth century. Two or three extracts are translated. It would be interesting to compare this manuscript, if genuine, with those of Hieracius and Theophilus, and to see if it had been in any way derived from them.

THE recent publication, by Professor J. Overbeck of Leipzig, of a third edition of his *History of Pompeian Art* has supplied the archaeological student with a mass of information and a number of illustrations of the results of the latest excavations which are not to be found in any other work. The volume is enriched by a large plan of the town, of which it is believed that two-thirds have now been brought to light, and has twenty-six coloured illustrations and 315 woodcuts, while the text gives a *résumé* of all the earlier monographs and observations of Professor Overbeck on the past and present aspect of the town, which owed their origin to repeated personal inspection and a prolonged study of the subject.

ACCORDING to the *Allgemeine Zeitung*, Piloty's colossal picture of *Thumelda in the Triumphal Procession of Germanicus* has been hung in the new Pinakothek at Munich, where it will remain permanently. The enormous weight of the frame added to the large size of the canvas threw great difficulties in the way of its transportation from Vienna, where it had formed one of the chief attractions of the German Gallery at the Vienna Exhibition, and it was found necessary to use special machinery for lifting it to the place which it now occupies on the walls of the Pinakothek. Its present position is considered to be specially well-adapted to show off its crowded and varied details under the best possible combinations of light and elevation.

THE STAGE.

"AWAKING."

Marcel, the little drama from the Théâtre Français, which Mr. Campbell Clark has adapted to the English stage, under the title of *Awaking*, and which they now play nightly at the Royalty Theatre before the after-dinner public gathers to see Mme. Dolaro in *La Périchole*, is a piece of serious, nay, almost of lugubrious interest, from end to end. All the dialogue is occupied with the telling of its pathetic story; there are no halts by the way: none of those abrupt pauses or transitions almost inevitable in English pieces—pauses and transitions which where, as in some fine pieces, they prevent the tension from being too great, are welcome like drops of rain in a thunder storm, but which much oftener, in the ordinary work of the day, effect no purpose but that of spoiling the

interest just beginning to be feebly aroused. *Marcel*—or *Awaking*—has none of these. The little piece has the concentration of a cabinet picture: no straggling composition or purposeless work is here.

The action passes during the first half hour of Victor Tremaine's return to his home. Some six years ago, handling a gun recklessly, after too excellent a lunch, he had shot his child, and had lost his reason through remorse and grief at his deed. The six years he has spent in a lunatic asylum; and now a second child, born at the time of the accident, has grown to be like the first and is called by his name. Reason is gradually returning to Tremaine, but he has not seen his wife or his son, and the play concerns itself with the scheme of doctor and wife to bring him home, and at first, when he finds himself there, to persuade him the cause of his remorse is but a creation of his fancy, and so to cure him altogether. He has had a fever, and many days' delirium—they will tell him anything but the truth at first, and the child before him he is to accept as the child he fancied he had killed. He wakes on a sofa to find himself at home; the doctor bends over him with a cheery word—he has had a narrow escape, he says—and the wife watches for what he will say. The puzzle, the complication, is better imagined than described. Now he is soothed: now he breaks out again. Now, left to himself, he puzzles over his position; recognises with half incredulous delight the child's toys on the mantelshelf, and then is encountered by the child himself, and begins to believe that the deception is truth. Of course there is the obvious difficulty of dates, and the lapse of years, and very soon he chances on the newspaper, and reads not of the Emperor and the Great Exhibition, but of the ex-Emperor and his exile at Chislehurst. He is wild again with dread, when his wife returns to him, and they bring the child to him to say who he is, and the whole truth dawns on the father at last, and he accepts it with the sanity they had been anxiously waiting for; and so the curtain falls on some gentle words of the wife, which point hardly to happiness, but to consolation.

A difficult piece to act—an ambitious piece to attempt—a piece most perilous to put before an everyday English audience, which scarcely recognises delicate art even when it has the opportunity. Many strictures have been passed on the way in which the little drama is played at the Royalty, especially in the minor parts, which, in tracing the story's outline, I have not had need to mention. But the performance on the whole—and I speak of the chief parts—is much to be praised, and to make comparisons between these actors and the company of the best theatre in all the world is not much to the point. The manager of the Théâtre Français, desiring to produce such a piece, can put his hand on any one he likes out of twenty or thirty trained artists, all of whom are fortified not only by the traditions of the theatre—by the superintendence at rehearsals of such a teacher as Regnier (the best teacher in the world, now that Samson is gone)—but by early and regular study of everything that can make an actor accomplished, and by constant association with a little society wholly artistic and cultivated. When the actors now playing at the Royalty Theatre can have advantages like these, it will be reasonable to demand in their performance the experience, the finish, the pregnant art, which the Rue Richelieu can naturally produce.

Not that I in the least omit to recognise how much they fail to do in the little theatre in Dean Street. The performance is tentative, slight—far indeed from complete. But it is undertaken, as far as one can see, with carefulness, intelligence, and feeling; and an experiment so made, deserves at least to be encouraged and commended. Throughout, the acting is quite free from exaggeration: the piece is under-acted, not over-acted. And this, of itself, if it be a fault, is one that is rare on the English stage. There is a ten-

dency to pass on too quickly; to rely too little on facial play and gesture; too much on rapid movement of the piece itself. Time and rhythm are as important in acting as in music, but of this too few people have any adequate appreciation. Gesture and word too often go together—it was a maxim of Samson's that the gesture must precede the word. When people are not sure of themselves, they are given to hurry, as if hurry could hide a mistake. But in a piece like this, every sentence must have its weight—nay, every word. There is always time for acting well and slowly anything that is worth acting at all. If you tell a story to another person on the stage, it should not be told like a story read out of a book. For a narration on the stage is supposed to be made for the first time—the very thought has to precede the word; the man has to *form* his story, not merely to *tell* it. A diner-out, if he is a good story-teller, is sure to know his story before, yet he plants his points leisurely, and is not in a mortal hurry to finish. Why should a narrative told upon the stage go off like a pistol-shot?

There should be more of detail in the performance at the Royalty—many looks that might be significant are missing; many gestures that might tell much, are unused. The effect would be immeasurably improved if the action passed in a room not luxuriously furnished, but more thoroughly furnished than this one. This room presents no evidence of civilised life, its refinements and occupations. It is not a room to live in. It is like a strange bare room at an inn, with no associations either pleasant or painful. It is decorated with curtains—Japanese curtains apparently—stretched flat over the wall, but of such a large, horrible and dazzling pattern that they suggest only the wall-paper of a fifth-rate lodging house in Islington or the Waterloo Road. No worse, no more dazzling background for faces and figures of men and women to move before, has it happened to us to see for a very long while at a theatre. And all this question of the appointments of a room—the absence of what makes a room look home-like—is by no means a little thing.

Mr. Lin Rayne is a thoughtful actor. His portrait of Sir Benjamin Backbite was almost the best thing in the Prince of Wales's performance of *The School for Scandal*. Here he has more difficult and varied work, and proves himself worthy to undertake it. I will not follow his performance in full. It is rather wanting in inventive detail, but is well conceived; and is never revolting (as it easily might be) by its realism. Mr. Rayne has many moments of natural and strong emotion: his cry, when the half-mad father sees on the mantelpiece the toys which remind him of his child's presence, is perhaps the truest and best found thing in his part. Mr. Stephens plays the doctor with his habitual *bonhomie*; and if he has not the vital interest in the success of his scheme that the wife should have, and the brother, he does but show the difference between his position and theirs. Still, a scheme of his planning should cost him greater anxiety than any which he shows. Miss Bessie Hollingshead—who appears as the wife—comes to the theatre from a few light performances elsewhere, and plays a part which though brief, is, by the intensity and strain of its emotion, worthy of the most accomplished and most experienced of artists. She plays it with no subtlety, yet with a simplicity so rare upon the stage, that the subtlety hardly seems to be wanting. Force is undoubtedly wanting: at the beginning of Miss Hollingshead's performance there is none of the evidence of strain which the wife inevitably must have shown. There is momentary anxiety, together with hopefulness—as there well may be—but there is no record of the Past this wife has gone through—the years in which she has suffered alone. She says her "Heaven help me!" at a critical point in the piece, with not enough of intensity. But on the other hand, her words of consolation to the husband—words on which

the curtain falls—are spoken with much quiet tenderness, and, whatever is lacking in experience, the good taste and refinement of her representation are so marked as to be beyond dispute. Miss E. Verner and Mr. Norton appear in small parts, which do not require detailed notice.

FREDERICK WEDMORE.

She Swoops to Conquer is to succeed *The Lady of Lyons* at the Gaiety; and at the Holborn Amphitheatre the curious experiment of reviving the *Maid's Tragedy* is to be made.

No new piece has been produced this week, but at the Princess's Theatre they have revived a melodrama of Mr. Henry J. Byron's, brought out first at the Queen's Theatre in 1808. This is the *Lancashire Lass*—a piece composed when the author's works were far less abundant than now; and this fact it is possible may be discovered on a survey of the piece, which has some faults, if also some merits, not now so commonly found in the efforts of its writer. The dramatic situation with which the prologue ends is conceived happily, and with real power. It is worthy, indeed, to be followed by a drama of a higher order of merit. The *Lancashire Lass* has most of the elements of general popularity: characters observed, perhaps, not too closely, but striking to the eye; a strong story; dialogue that may be followed with interest; and some comic incident, to boot. For a piece of the kind, it is well acted. Mr. Emery, Mr. Terriss, Mr. Belmore, Miss Lydia Foote, and Mrs. Alfred Mellon play the principal characters. Mrs. Mellon's performance is never lacking in vigour, never in individuality, though sometimes in variety. Miss Lydia Foote, as the ill-faring heroine, displays much stage experience and excellent intentions in acting. It may hardly be said, however, that she causes us to forget the loss of the part's original exponent—an actress by no means stronger than herself, but endowed with a simplicity of pathos all her own—Miss Nellie Moore. Mr. Terriss is a young actor of pleasing appearance. In his art there is room for improvement, and probably he will continue to improve. Mr. Howard, who also plays in the piece, has a part which is not a gracious one. Mr. Belmore's performance of the eccentric or imbecile "Spotty" calls forth the needful laughter, and Mr. Emery as "the party by the name of Johnson," gives us one of his vigorous sketches, though not one of his best. He has a drunken scene—the almost inevitable drunken-scene of English plays—and this it would be well to make less of, for Mr. Emery's art will stand on its own merits, and he should allow it to do so. Mr. Lloyds is one of our foremost scene painters, and here his work is of the realistic kind.

A MORNING performance of *As You Like It* was given at the Gaiety last Saturday. Mr. Kendal was Orlando; Mrs. Kendal, Rosalind; Mr. Vezin, Jacques; Mr. Taylor, Touchstone; and Miss Douglas, Celia. The performance of Mrs. Kendal, which was that most worthy of attention, was not new to a London public, if the Crystal Palace, where she had given it, is to be counted as London. Mr. Maclean was really a good Adam, and Miss West appeared as Audrey.

THE pantomime season is coming to an end. It has been unusually successful. The *Babes in the Wood* is in a very few days to be withdrawn from Covent Garden; and though *Aladdin*—with the Vokes's humorous performance—is not so soon to be withdrawn from Drury Lane, the programme of that theatre is to be strengthened by a revival of *Rebecca*—the Wizard of the North and Mr. Andrew Halliday.

Uncle Tom's Cabin was to be reproduced last Thursday at the Adelphi Theatre, where it must now stand wholly on such merits as it has as a story or play. Time was when sentiment upon the subject counted for much in its success.

AT Saturday's morning performance for the benefit of the Cospatrick fund, at the Princess's Theatre, Mr. Ryder's Master Walter—in *The Hunchback*—came out strongly as a piece of elocution and sound acting, in contrast to many of the other parts. Miss Alleyne has studied Julia; but can hardly yet act it.

THE Alexandra Theatre was last night to bring out *The Lady of Lyons*, with Miss Clayton, a pupil of Mr. Henry Marston's, it is said, as Pauline, and with Mr. Walter Bentley, recently of the Court Theatre, as Claude Melnotte. Mr. Bentley is a nephew of Miss Emily Faithfull and son of an Edinburgh divine.

MISS LITTON has taken the St. James's Theatre for the kind of entertainment which has been given by her at the Court; and she, and such members of her company as she may take with her, will move to the St. James's about Easter.

THE Edinburgh Theatre Royal was burnt to the ground last Saturday. It was a fine house, built only ten years ago on a site which had previously witnessed two destructive fires.

THE revival of *Les Filles de Marbre* at the Théâtre Lyrique-Dramatique has given Parisians an opportunity of seeing an old-fashioned melodrama, but one that is not now excessively well played. It may be doubted, however, whether it was really better acted many years since than now, for with regard to melodramas the Parisians have become more difficult to please. Of old time there were two or three good actors, but no ensemble in melodrama. Nothing like the performance of *Deux Orphelines* could then have been seen in a Paris theatre. Castellano, the manager of the Lyrique-Dramatique, has before now acted well, but there is now visible in his play some evidence of want of practice or else of time not having brought with it maturity. Mlle. Dewintre, who passed into the Théâtre Français and quickly out of it again, has been engaged to play Marco, a leading character in *Les Filles de Marbre*, but in her hands the character is but colourless and poor. One part only is well played in the piece, and that is the character of Marthe, by Mlle. Andrée Kelly, who appeared for a short time, as playgoers may remember, in the French plays at the Princess's Theatre last season.

THE Théâtre des Arts has produced a five-act drama called *Manette* by M. Alexis Bouvier, who boasts himself as belonging to the realistic school. His novels have some sale, if but little admiration; but long life will probably be denied to his dramatic work, which has in it a certain element of brutality—a certain carefully-kept crudity, so to say, which is distasteful even to a public not conspicuously sensitive. Mlle. Lacrosonnière and Paul Clèves are included in the cast.

M. BLUX's drama, *Rose Michel*, which, with the acting of Mlle. Fargueil, is having so much success at the Ambigu, is now being translated into English, Italian, Spanish, German, Dutch, Greek, and Russian.

AT the Salle Taitbout they have produced a drama from the *Corinne* of Mme. de Staël. The work is dramatised by M. A. Laya.

A NEW light sort of *étude* by Arsène Houssaye, and a new preface to the book itself by M. Alexandre Dumas, have made the *Manon Lescaut* of l'Abbé Prévost a good deal talked of lately. There is therefore an immediate interest—perhaps not one of long duration—in the revival of Théodore Barrière's play at the Vaudeville. It was first produced four and twenty years ago, and though acted then by Rose Chéri, by Bressant, Dupuis, and Geoffroy, it was successful not so much with the ordinary public as with a chosen band of amateurs. It would seem now, after the *Dame aux Camélias*, to have less reason than ever to exist and be played. Jules Janin sang its praises eloquently enough in 1851; but Sarcey

and the powers that be, in the present year, are less favourably inclined.

BJÖRNSTJERNE BJÖRNSEN's two new dramas, which were to have been brought out at Copenhagen at Christmas, but which, for some mysterious reason, never made their appearance, have just been brought out elsewhere. *Et Handelshus* ("A House of Business") was represented in the New Theatre at Stockholm on January 19 with considerable success, although the last act is described as hurried and ill-conceived. *En Fallit* ("A Bankruptcy") has been brought out with great success in Bergen.

MUSIC.

POPULAR CONCERTS.—ST. JAMES'S HALL.

It is unfortunate, though unavoidable, that the Saturday Popular Concerts at St. James's Hall should take place at the same hour as the Crystal Palace Concerts; because sometimes the attractions at both places are so great as to render the choice a matter of some difficulty. Such was the case on Saturday last: at Sydenham Herr Joachim was announced to make his first appearance this season, while at St. James's Hall Hans von Bülow was for the present to take his farewell. Knowing that on Monday a second opportunity of hearing the great violinist would be afforded, I decided in favour of St. James's Hall, and was rewarded by an exceedingly fine and interesting concert. The opening piece was Beethoven's great quartet in C (No. 9), the third of the set dedicated to Count Rasoumofsky, and usually known by his name as the "Rasoumofsky quartets." It was excellently led by M. Sainton, who was in his best vein, and was admirably supported by Messrs. L. Ries, Zerbini, and Piatti. The wonderful *pizzicato* of the last-named gentleman in the slow movement was alone worth the journey to St. James's Hall to hear. After Miss Ellen Horne had sung Dussek's pretty though old-fashioned song, "Name the glad day," Dr. Bülow performed as his solo Schumann's "Faschingschwank aus Wien," which was on this occasion brought forward for the first time at these concerts. As its name implies, this work was written on the occasion of the Carnival in Vienna, and was, in fact, for the most part composed while that festival was in progress. The reminiscences of the Carnival seem, however, to be chiefly confined to the first movement with its varied dance-like rhythms; it is difficult to see any connexion between the title and the dreamy Romance or the passionate Intermezzo which form respectively the second and fourth portions of the work. The finale is a brilliant movement in sonata form, while the "Scherzino" (No. 3) is as light and airy as one of Mendelssohn's fairy pictures in the *Midsummer Night's Dream*. Excepting in the Romance and Intermezzo there is scarcely to be found in the work a trace of the melancholy which runs as an undercurrent through nearly all of Schumann's compositions. Dr. Bülow's performance, though perhaps open to criticism in some points (especially in his very forcible reading of the "Scherzino"), was, on the whole, magnificent. His playing of the last two movements, more particularly, was most masterly. Another "first performance" followed in Grieg's very original sonata in F for piano and violin, a work which, though often to be seen in continental programmes, had not previously been brought to a hearing in London. Though containing many points of interest, and full of its composer's individuality, it is not, as a whole, equal either to his later sonata in G for the same instruments (recently played at these concerts, if I am not mistaken, by Mr. Charles Hallé and Madame Norman-Néruda), or to the piano concerto introduced with such success by Mr. Dannreuther last year at the Crystal Palace. The best part of the present work is the middle movement (*allegretto quasi andantino*), which is particularly quaint and pleasing. The sonata

was played to perfection by Messrs. Bülow and Sainton. After Miss Horne had sung Macfarren's "Pack clouds away," with the excellent clarinet obligato of Mr. Lazarus, the concert concluded with Spohr's quintett for piano and strings in D minor, a highly-finished and very melodious work, containing no features on which it is needful to dwell.

On Monday evening Herr Joachim reappeared at these concerts. It is most difficult to write anything new about this great artist, simply because his playing is always the very ideal of perfection. In execution he may be equalled by others; as regards mere quality of tone, he is surpassed by Wilhelmj; but in intellectual conception of whatever he interprets, in that complete self-abnegation which enables him to throw himself so entirely into the spirit of whatever he plays that admiration of the performer is lost in enjoyment of the music, he is still unapproached. No player, moreover, surpasses, and few equal him in the extent of his repertoire. He is not merely great in one style; but from Bach and Tartini down to Schumann and Brahms the whole range of violin music seems equally familiar and equally sympathetic to him. The opening quartett on Monday night (Schubert's great work in D minor) showed at once that Joachim has come back to us as great as ever. Of the quartett itself I spoke in these columns on the occasion of its last performance in St. James's Hall (see ACADEMY, February 28, 1874), and there is no occasion to repeat what was then said. It is worth while, in passing, to correct an error in the programme of the concert, because there is a curious confusion in the statements there made as to Schubert's quartetts. The present work is called "Op. 161," a number which belongs not to it, but to the great quartett in G. The present work was published as an "Œuvre posthume," and without any opus-number at all. Furthermore, the programme states that "four others have been published—one in F (posthumous), printed singly; one in E flat and one in E, forming together Op. 125, and one in G major, companion to the quartett in D minor." This is altogether incorrect: there are eight others published, including the fragment in C minor, not one of which is in F, the "posthumous" work referred to being the very one played on Monday; and (to say nothing of the quartetts in B flat, G minor, and D) it is very singular that there should be no mention of the quartett in A minor, Op. 29, seeing that this work has been played twelve times at the Monday Popular Concerts.

Herr Joachim's return to St. James's Hall usually gives us the opportunity of hearing some of those wonderful old violin solos of Bach's which he is almost the only player to bring forward. Accordingly on Monday night he performed two movements from the sonata in A minor, and being enthusiastically encored, gave in addition the charming Bourrée from the sonata in B minor. If Joachim has any speciality, it is his playing of these Bach sonatas, which, taken as a whole, are probably the most difficult pieces ever written for the instrument; and never has he shown more decisively than on this occasion his complete mastery both of their technical details and of their artistic contents.

The pianist of the evening was Mr. Franklin Taylor, one of the best of the younger generation of pianoforte players. He was first heard in Beethoven's sonata in E flat, Op. 31, No. 3, of which he gave an excellent rendering, though he took the second movement considerably slower than usual, whereby its effect was not increased. He also, with Messrs. Joachim, Ries, Straus and Piatti, performed Schumann's always popular quintett in E flat, an old favourite at these concerts, being on this occasion given for the fourteenth time. The vocalist was Miss Enriquez, a lady with a very rich contralto voice, and the conductor, Mr. Zerbini.

Next Monday the first part of the programme

will be selected from the works of Sterndale Bennett, in which Mdle. Krebs, Herr Joachim, and Signor Piatti will take part.

EBENEZER PROUT.

THE interment last Saturday in Westminster Abbey of the remains of the late Sir Sterndale Bennett was a fitting tribute to the memory of one of the most genuine artists whom this country has produced. A requisition was addressed to the Dean of Westminster, signed not only by many leading members of the musical profession, but also by such amateurs as the Earl of Dudley, Lord Coleridge, and the Bishop of Gloucester and Bristol, and asking the desired permission not only as a mark of respect for the genius and worth of the deceased musician, "but on more public grounds as a just recognition of the Art of which he was so distinguished an ornament." Dean Stanley at once consented, and the gathering in the Abbey was one not soon to be forgotten by those who were present. Never, probably, within the memory of any one living has such an assemblage of eminent musicians been seen on any occasion as that which met to pay the last tribute to their distinguished brother in art. It would be an easier task to name those who were absent than those who were present. The procession consisted of more than twenty mourning coaches, beside the private carriages of Her Majesty, the Prince of Wales, the Duke of Edinburgh, the Earl of Dudley, the Bishop of Gloucester, and others. The pall-bearers were selected from Sir Sterndale Bennett's fellow-students at the Academy, among whom were to be seen Messrs. T. Harper, W. H. Holmes, James Howell, G. A. Macfarren, T. M. Mudie, and Brinley Richards. The University of Cambridge sent a deputation consisting of the Vice-Chancellor, Dr. Bateson, the master of St. John's College, and the Rev. Arthur Beard, Precentor of King's. Next followed Earl Dudley, the President of the Royal Academy of Music, and the Directors and Committee of that institution. Deputations from the Philharmonic Society, the Royal Society of Musicians and the German Athenæum succeeded. Lastly came the entire staff of professors of the Royal Academy. The funeral service, with the exception of the lesson, was read by the Dean, the music being sung by a vocal force of twenty-eight boys and twenty-four men, selected from the choirs of the Abbey, St. Paul's, the Temple, the Chapel Royal and Lincoln's Inn Chapel. With great appropriateness, the anthem selected was the quartett "God is a Spirit," from the *Woman of Samaria*, which was exquisitely sung without accompaniment, the first part by solo voices (Master Beckham, and Messrs. Foster, Carter and Lawler), and the full chorus entering toward the close. In addition to the usual funeral service music by Croft and Purcell, Handel's chorus "His body is buried in peace" was sung before the benediction. Mr. Turle, the organist of the Abbey, accompanied the vocal music and played the voluntaries with great taste. A more appropriate and impressive burial service for a musician could have been neither desired nor imagined. It will interest our readers to know that Sir Sterndale Bennett's grave is in the north aisle, near those of Croft and Purcell, and just under the monument to William Wilberforce.

LAST Saturday's Crystal Palace Concert opened with a Suite in C major by J. Seb. Bach, which on this occasion was most probably heard for the first time in England. This species of composition, consisting of a series of mostly short movements, the whole of which are in the same key, has now been almost entirely superseded by the symphony. The modern suites, by Raff, Lachner, Grimm, and others, have little more than a general resemblance to those of the last century. The Suite in C by Bach, which is written for strings, oboes, and bassoons, commences with an introduction and fugue, in which the old master's wonderful command of counterpoint is shown to great advantage. The movements which follow

are a courante, gavotte, forlane (an old Venetian dance), minuet, bourrée, and passepied. In all of these a strongly marked rhythmical character is observable, and the revival of the work appeared to give much pleasure to the audience. Herr Joachim, of whom we have spoken above, made his first appearance this season in a portion of Spohr's Sixth Concerto for the violin, which he played in his own unapproachable style, and a pleasing Notturmo of his own for solo violin, with accompaniment for a small orchestra. The vocalists were Miss Sophie Löwe and Mr. Henry Guy. A fine performance of Beethoven's symphony in B flat concluded the concert.

SIGNOR AGNESI, the baritone singer, has recently died in London of dropsy. He was a native of Belgium (his real name being Agniesz), and was well known both on the stage and in the concert-room as an excellent artist. His forte was operatic music; in works of a more serious character he was less successful.

THE death is also announced from Vienna of the violinist Leopold Jansa, in the seventy-ninth year of his age. He was a native of Bohemia, and will be remembered by some of our readers as having been for many years resident in London.

A NEW "Bach Society" has just been founded at Leipzig under the direction of Herr A. Volkland, the object of which is the performance of the almost entirely unknown vocal compositions of the old Cantor.

It is reported from Vienna that at the concert to be given in that city on March 1, by Wagner and Liszt, the new work by the latter entitled *Die Glocken des Strassburger Münsters*, and three fragments from Wagner's *Götterdämmerung* will be performed.

It has been officially announced that the German musical festival which was to have been held at Munich this summer will be deferred until another year, in consequence of the difficulties experienced by the managers of making all the necessary arrangements at the time originally fixed for its celebration.

JUST PUBLISHED,

THE HISTORY OF MUSIC (ART AND SCIENCE).

From the EARLIEST RECORDS to the FALL of the ROMAN EMPIRE. With EXPLANATIONS of ANCIENT SYSTEMS of MUSIC, ANCIENT MUSICAL INSTRUMENTS, and of the TRUE BASIS for the SCIENCE of MUSIC, ANCIENT or MODERN.

By W. CHAPPELL, F.S.A.,

Author of "A History of the Ballad Literature and Popular Music of the Olden Time." Price 16s.

In Two Volumes, royal 8vo, cloth boards, 42s.

THE BALLAD LITERATURE AND POPULAR MUSIC OF THE OLDEN TIME:

A COLLECTION OF THE OLD SONGS, BALLADS, AND DANCE TUNES WHICH CONSTITUTE THE NATIONAL MUSIC OF ENGLAND; ARRANGED CHRONOLOGICALLY WITH REMARKS AND ANECDOTES, AND PRECEDED BY SKETCHES OF THE EARLY STATE OF MUSIC, AND OF THE AMUSEMENTS ASSOCIATED WITH IT IN ENGLAND DURING THE VARIOUS REIGNS.

By W. CHAPPELL, F.S.A.

The present Work, indispensable to all who are interested in the Popular Literature of England, is the result of many years' careful research among MSS., Black Letter Books, and the numerous ephemeral Publications of the Sixteenth, Seventeenth, and the early part of the Eighteenth Century. The various Ballad collections such as the Pepys, the Roxburghe, the Bagford, the Douce, the Rawlinson, &c., have been laid under contribution; whilst the Garlands collected by Pepys, Ashmole, Wood, Luttrell, &c., have furnished considerable matter in illustration of the subject. The old Dramatists have been carefully gleaned for notices of Old Songs and Ballads and every available source likely to enrich the Work has been examined and quoted. Thus, the book is not a mere collection of Old English Tunes, but an account Popular and Literary, of hundreds of our Old Ballads; in many cases giving entire Ballads for the first time in an accessible shape. The Two Volumes contain upwards of Eight Hundred Pages, with Facsimiles from old MSS. and Printed Books.

OLD ENGLISH DITTIES.

All the Favourite Songs selected from "Popular Music of the Olden Time," with Symphonies and Accompaniments for the Pianoforte by G. A. MACFARREN; the long Ballads compressed, and in some cases new words written, by JOHN OXENFORD.

Large Folio Edition, printed from Engraved Plates, cloth, 21s. Small-Type Edition, complete, cloth, 10s. 6d.; or, half-bound in morocco, 15s. The above Work is also divided into Thirteen Parts, full music size, each Part containing Twelve Songs, 6s.

N.B.—All the most favourite of the Old English Ditties are also published separately, from Engraved Plates, Large Folio Size, each 1s.

THE THREE YEARS SYSTEM OF HIRE AND PURCHASE.

Pianofortes of every Description, and by all the Best Makers, may be had at

CHAPPELL & CO.'S, 50, NEW BOND STREET.

PIANOFORTES for HIRE, BY ALL THE BEST MAKERS.

CHAPPELL & CO.'S ENGLISH IRON GRAND PIANOFORTE, Walnut Case, 135 Guineas.

CHAPPELL & CO.'S COTTAGE PIANOFORTES, from 15 Guineas upwards.

ORGANS.—AMERICAN ORGANS, ALEXANDRE ORGANS, and ALEXANDRE HARMONIUMS may be compared together for PURCHASE or HIRE, on the THREE YEARS SYSTEM.

ORGANS for DRAWING-ROOM or CHURCHES, from 45 Guineas to 250 Guineas, for SALE or HIRE on the THREE YEARS SYSTEM.

LITERATURE.

KINGLAKE'S BATTLE OF INKERMANN.

The Invasion of the Crimea: its Origin, and an Account of its Progress down to the Death of Lord Raglan. By A. W. Kinglake. Vol. V. Battle of Inkerman. (Edinburgh and London: William Blackwood & Sons, 1875.)

WE have heard it objected to Mr. Kinglake's history of the Crimean War that it is so long; but the objection seems to us a perfectly unreasonable one. When it is remembered that a few months ago the newspapers were printing every day about the Tichborne trial what, if set up in large type, would have amounted to a good-sized volume, and that thousands of readers used to spell through every word of it, surely it is not too much to say that a comparatively minute fraction of public attention may fairly be demanded for an account of the only European war in which this country has been engaged since Waterloo, and that a volume of very moderate size, as regards quantity of printed matter, is not an excessive pace to devote to a description of one of the most momentous battles in which English arms have ever been engaged. It would be a trite thing to say that, although the number of British troops engaged was small, the fighting was hard and the issue of the first importance. If we had lost the day at Inkerman, we should unquestionably have been driven out of the Crimea, and although the loss in men in such case might not perhaps have been greater than that which actually occurred, since but a small proportion of the victors survived, or at any rate remained effective throughout the following winter, there would have been an end of an invasion of the Crimea, if not of the war, and the loss of prestige could never have been made good. No exception can therefore, we think, be fairly taken to the amount of space which Mr. Kinglake has devoted to his description of the battle: whether he has turned it to the best use is another matter. There are two ways, speaking broadly, in which such an event may be described: there is the critical method, which points out the mistakes made on both sides, and teaches how they should be avoided in the future; and there is the sort of writing known as word-painting, with the object of making a picture which shall enable the reader to realise the scene, without distracting his attention by drawing inferences. This last is the mode affected by special war correspondents, who however sometimes interpolate criticism in their nar-

ative very freely; and it is the plan adopted by Mr. Kinglake, except that the criticism has been omitted. No one would learn from his account of Inkerman whether or not it was fought in the best possible way, although no doubt every reader will draw the moral for himself. But for anything said by Mr. Kinglake to the contrary, it might be inferred that the proper way to lead a force into action is to break up every battalion into detachments as it arrives on the ground, sending one to the right and another to the left, taking care that no regiment shall be attached to its own brigade, and that the brigades of a division shall invariably be separated from each other, the division commander thus either having nothing to do, or else taking perforce the command of one brigade out of the hands of the brigadier. Equally might it be inferred that it is the duty of a commander-in-chief to leave a battle to be fought out by one of his subordinates. Although therefore the result may be unintentional, the account of the battle appears certainly unfair to Lord Raglan's memory, for the impression which the reader would carry away from it is, that beyond giving the very natural order to bring up a couple of available siege guns, the commander-in-chief did little or nothing throughout the day but sit calmly on his horse, while General Pennefather fought the battle in front, setting an admirable example of coolness and courage, no doubt, at a time when it was highly needed, but otherwise hardly fulfilling the functions which are usually associated with the office.

Mr. Kinglake has attempted to give an exact description of what happened in every part of the field and at every part of the day; but we doubt whether the result is after all to convey a very complete impression of what the battle actually was like—not from want of detail, of that there is abundance; not only are we told what everybody did, but almost what everybody said—about three pages, for example, are devoted to describing how General Pennefather swore—but because the task is from the nature of the case impossible. In the first place, we believe that not even the coolest observer can reproduce exactly what happens in moments of excitement, still less the exact course of events when the stress extends as at Inkerman over several hours; still less, again, when the effort to restore the picture is made after an interval of several years. Next, because it is impossible in such cases to tell all the truth: the historian may describe the feats of the heroes, but he cannot describe what was done by those whose conduct was not heroic. Mr. Kinglake certainly has essayed that part of the task in the case of the French, while omitting all reference to it in the case of the English, and the result is necessarily a perfectly distorted picture.

As an instance how the attempt to be minute leads to inaccuracy, we may cite the account of what happened to the Grand Dukes. These young Princes were kept at Mentschikoff's side,

"on ground where they could not be harmed by horse, foot, or field artillery, and [Mentschikoff] was still in this way doing all that seemed needed for exposing them to the ridicule of Europe, when happily

for them a ball, discharged at long range from a siege-gun, enabled him to report, and this, too, with literal truth, that the two lads had been under fire. The demeanour of the two youthful princes when the missile swept past them was all that a proud father could wish" (p. 417).

It would be interesting to know in what way this demeanour was exhibited. The standard of etiquette in the matter of round shot used to be that it was not proper to bob your head when it whistled past. Does Mr. Kinglake mean to say that there is any trustworthy evidence available as to whether the Princes did or did not bob their heads on the particular occasion of this solitary shot coming by them, and in the absence of such evidence what is to be predicated in the matter one way or the other? What sort of a bearing in his son, in such case, would be needed to satisfy a proud father, remembering that the danger is over as soon as the sound of the shot is heard? Nothing more absurd has in truth been written about the baptism of fire undergone by the Prince Imperial at Saarbruck, or later, about that undergone by King Alfonso. With a profession of accuracy, Mr. Kinglake is here obviously inaccurate, since he is describing that which, from the nature of the case, does not admit of description. One might as well pass judgment on a man's character from his manner of taking a pinch of snuff.

As regards these two guns, indeed, the employment of which Mr. Kinglake appears to regard as a stroke of genius, although no doubt their fire proved very serviceable, we believe he altogether overestimates their efficacy. According to Mr. Kinglake (pp. 373-7), these two guns "shut up," to use the expressive colloquialism, the enemy's fire of a hundred cannon. As he truly remarks, "it may well appear strange at first sight that the accession of only two heavy guns should suddenly enable his [the Russian's] adversary to work a cardinal change." It would indeed, and will appear still more strange if we bring the light of common sense to bear on the subject. The fire of eighteen-pounders, we may observe, is what British troops had abundant experience of during the Sepoy war, when the enemy brought these guns time after time into the field—until, in fact, all their stock of them was captured—and the sort of effect to be produced by them is pretty well known. They shot straighter than the old nine-pounder, although nothing like the new field gun in accuracy, and made more noise, which Mr. Kinglake may think a recommendation; but they took much longer to load and fire, and in that respect were decidedly inferior to the field gun. For, after all, a man can be but killed, and a nine-pounder shot will kill one just as effectually as a bigger—if it hits him. Mr. Kinglake indeed talks of the eighteen-pounder shot as tearing through the masses of men, but this is a mere figure of speech; on the average there was nothing like one man hit for each shot fired. When it is considered that there were only about 3,000 Russians killed altogether from the fire of over seventy field-guns lasting over several hours, to say nothing of that of the infantry, which did by far the greater part of the execution, it is not to be supposed that 375

men were killed by the 375 eighteen-pound shot which were altogether fired from these two guns. But, in fact, it must be quite impossible in any battle to distinguish the particular effect of particular guns, and still more must this have been the case at Inkerman, where the view was obscured by fog as well as smoke, and guns and men were crowded together on a narrow front. The readers of the late General Mercer's very interesting account of Waterloo may remember his description of the terrible loss inflicted on his battery, on its coming into action, from the enemy's artillery, and that he expressly mentions that he could not distinguish the guns or the part of the field from which the deadly fire came. It is just the same on every similar occasion. When infantry are advancing against artillery at close quarters the case is of course different; but if a strict debtor and creditor account could be made out when guns are playing at long bowls against guns, then obviously battles would soon be decided by all the combatants being swept away; it is because gunners cannot see to take aim on such occasions, or are too excited to do so properly, that anybody at all escapes from the field of battle; still less can they watch the effect of their shots. And the obscurity and consequent wild firing at Inkerman is sufficiently indicated by the comparatively small loss sustained by our artillery. Mr. Kinglake, indeed, seems to consider the loss heavy, because more than one-tenth of the detachment serving the two heavy guns were hit in the first quarter of an hour; but probably most artillerymen who have to go into action under a heavy fire will think their batteries to come off cheap if they can get through the first critical few minutes, before the enemy's fire is checked, with so small a loss; certainly a battalion of infantry 500 strong would be in great luck to lose only fifty men after being hotly engaged for a quarter of an hour. But in truth the wonderful thing about battles is not that so many people are killed, but that so many escape. Inkerman was a bloody and stubborn fight, but the loss being about 2,350 out of 7,660 men engaged, it follows that 5,310 men escaped unhurt. For hours the battle raged, a hundred guns were aimed against our troops, and a good deal of the musketry fighting was done literally at pistol-shot, and yet at the end of the business more than two-thirds of the number are safe and sound; only tired and hungry. Compare the number of shots fired off, of both small-arms and cannon, with the number of hits, and we may form a notion of the difference between the sort of firing that takes place in the excitement and confusion of actual warfare, and that which is carried on in all the composure of peaceful target practice.

Space does not permit of joining issue with Mr. Kinglake on the grave question he has raised regarding the conduct of the French troops at Inkerman, save to remark on the conspicuous unfairness of the way in which the misbehaviour of one French officer who rides to the rear is accepted as typical of the general condition of the French troops. Were there, it may be asked, no scared faces on our side? If not, then Inkerman was very unlike any other battle

that has ever been fought, whether by the British or any other nation. But in a matter of this sort, a reference to the list of killed and wounded is a very fair index of the sort of work done by troops. Now the French, although they came into action much later than ourselves, lost over 1,700 men during the day, the greater part on the heights of Inkerman, a loss which represents, for the time they were engaged, pretty hard fighting. Mr. Kinglake, indeed, characteristically throws a doubt over the accuracy of the return, saying (p. 448) that the French "stated" their loss to be so much, but without adding any evidence to justify the sneer. What possible object Mr. Kinglake proposed to himself by such a treatment of this part of his part of the subject it is difficult to imagine. He could hardly suppose that the survivors of the English combatants are possessed with so small a spirit of vanity as to be gratified by this exaltation of their prowess at the expense of their French comrades. At any rate, it is to be hoped that our gallant neighbours will not accept the statements advanced in this book as in any degree representing the opinions or feelings of their late allies.

But whatever may be the reader's opinion as to Mr. Kinglake's mode of dealing with the facts, the general result of the battle is one which Englishmen may reasonably regard with complacency. At the Alma the Russians had chosen their own ground for awaiting our attack, and in less than three hours were driven from it discomfited. At Inkerman they were the assailants, and had again the choice of time and opportunity; yet our troops, taken by surprise, and led up against the enemy fasting and in disorder, nevertheless drove back vastly superior forces of the enemy with signal discomfiture. It is, we may venture to believe, not mere national vanity which makes Englishmen believe that, if the position of the contending armies had been reversed, the result of the battle in each case would have been different.

G. CHESNEY.

The Pilgrim's Progress as Originally Published by John Bunyan, being a Facsimile Reproduction of the First Edition. (London: Elliot Stock, 1875.)

THE *Pilgrim's Progress* is one of the strangest phenomena of literature, perhaps, indeed, the strangest. That a man of Bunyan's position, with all its crushing disadvantages, should have produced a work that was at once welcomed and loved by the class out of which its author sprang, and eventually won the admiration of the best judgments of the nation, is an achievement without a parallel. The case of Burns is quite different. As compared with the Bedford tinker, the Ayrshire ploughman was born in favourable circumstances, and in his very youth acquired no mean culture. Bunyan's high success makes one half doubt the existence of "mute inglorious Miltons." His genius was absolutely irrepressible. He was "man and master of his fate." At no time of his life did he breathe a truly genial atmosphere. Even in the society into which he was happily raised there were many influences that might have proved fatal to a

less hardy and sovereign spirit. One may see from his "Apology" for his book that among his co-religionists there were many who considered his "feigning" to be of the world worldly. But all lets and hindrances,—"the blows of circumstance," the narrowness of sect, the indifference or contempt of the powers that were—all these "invidious bars" he broke through, and in some sort found for himself freedom and power. So did "the foolish things of the world" "confound the wise."

To many persons it is a distinct pleasure and a valuable help to peruse a man's writings in the very shape in which he sent them forth; to know his very orthography seems to bring the author nearer. And of course there are cases where the orthography may cast light upon the thought. But it is not only for such reasons that a facsimile reprint of the *Pilgrim's Progress* deserves notice. As we know so little of the growth of Bunyan's genius, a facsimile has special interest from the possibility that it may aid to elucidate that remarkable problem. The assistance may be inconsiderable; but certainly in the instance of Bunyan no assistance however feeble and meagre is to be rejected.

Only one copy of the first edition of the First Part of the *Pilgrim's Progress* is extant, so far as is known; and this is a comparatively recent find. It is in the library of H. S. Holford, Esq., of Weston-Birt House, Tetbury, Gloucestershire. It is a significant sign of the popularity of the work that the second edition was issued in the same year as the first, viz. 1678, the date of the Third Part of *Hudibras*, four years after the death of Milton, three years before the publication of *Absalom and Achiophel*. It seems fairly certain that it had been written some years before. One may well accept the common belief that "the den" was Bedford Gaol; and it was in June, 1672, that Bunyan was released therefrom. Moreover, we may gather from the Apology above mentioned that there was an appreciable interval between the production and the publication. He was busy, he says,

"Writing of the Way
And Race of Saints in this our Gospel Day,"
when he

"Fell suddenly into an Allegory
About their journey and the way to Glory."
His ideas "breed so fast" that he resolved to "put them by themselves."

"Well, so I did; but yet I did not think
To shew to all the World my Pen and Ink
In such a mode; I only thought to make
I knew not what: nor did I undertake
Thereby to please my neighbour; no, not I;
I did it mine own self to gratifie."

When "mine ends" were thus put together, he consulted others about them, and it is evident the very life of the precious MS. was not altogether secure—

"Some said Let them live; some, Let them die;
Some said, John, print it; others said Not so;
Some said It might do good; others said No."

Thus his book, "in wors condition than a peccant soul," had "to stand before a Jury ere it" could "be born to the world, and undergo yet in darkness the judgment of Rhadamanth and his colleagues ere it" could "pass the ferry backward into light." In these deliberations probably some time was

early Norman period; and it cites the Berkeley Tombs in Bristol Cathedral as the perhaps sole exception where mistletoe is admitted in ecclesiastical carving. Amid a "richesse" of mythic and sacred lore touching the ash, the oak, the four woods that lay a claim to have composed the cross, and the rowan, which divides with the hazel the divinatory power that can trace, as Mr. Baring Gould's "Curious Myths" have taught us, not merely springs of water and veins of metal, but hidden crime, up and down the course of rivers for miles and leagues, Mr. King finds space for a variety of nice points connected with flower folk-lore, *e.g.*, for deposing the whitethorn, or aubépine, from its pretensions to have furnished the crown of thorns (in spite of the belief long held in Northern Europe), and assigning this pre-eminence to the Nabk, a species of buckthorn still found growing near Jerusalem, identical with the "atad" of Scripture, and the "bramble" of our English version (p. 66). So, too, for finding the lily of the field, so commended on the Mount of Beatitudes, not, as Benedictines and Cistercians would, in the virginal lily of the valley, nor yet in the golden amaryllis with which Sir J. E. Smith identified it, but rather in the scarlet martagon lily, which is specially abundant in Galilee, and which, grouping itself into tall pyramids of glorious hue at the early summer season, when the Sermon on the Mount is supposed to have been delivered, might "suggest comparison with the royal robes of Solomon" (p. 72). A pretty bit of Cheshire folk-lore is noted in p. 64 in respect of a species of orchis, there surnamed "Gethsemane," and said to have contracted the dark stains which immemorially mark its leaves from the precious drops of blood that fell on it as it nestled beneath the cross; and the essay referred to teems with illustrations of a pious and fond faith in such associations of flowers and trees with the Saviour and his teaching. Many of the herbs and flowers famous on panel or spandrel in our churches have been transferred thither from living models in the monkish garden-plot, into which were imported the manifold all-heals, which still bear the names of "angelica," "archangel," "herb bennet" (the blessed herb), and so forth.

"Nor herb nor flowret glistening there

But was carved in the cloister arches as fair."

In truth Mr. King's essay hereupon may stand as a valuable *locus classicus* for the curiosities of the monastic garden or herbary, and will yield pertinent matter to such as enquire into the association of the trefoil with the Trinity, and the discrimination of romance from reality in the story of the Passion Flower. The same may be said of the Dog essay, which goes back past Ulysses' Argus, and Llewellyn's Gellert (said to have claims to an Aryan original), to Esarhaddon's large-headed and curly-tailed prototype of a Mount St. Bernard, now in the British Museum, and commemorates good dogs and bad dogs, such as the dog of the Seven Sleepers, Kitner Roderick's Theron, Arthur's Cavall and Fingal's Bran, on the one hand, and Henry II.'s Mathe, the faithless dog of history, and the weird packs of "wish-hounds" and dogs-of-hell met with

here and there in mediaeval folk-lore, on the other. The wastes of Dartmoor, with which Mr. King is intimately acquainted, are one special hunting-ground for these diversely-pictured fire-breathers and their weird master, and he is not yet exorcised from some counties of South Wales. Mr. King attributes this class of superstition to the extravagance of monastic imagination which associated the world and its masters, seen from the cell in the desert, with the wild hunting baron, the yelling of hounds, and the clattering of horse-hoofs. The ghostly master and his surroundings represented the spirits of wicked worldlings in torment, burdened with the weight of helm and hauberk, as, to use the Prophet's language, "descenderunt in infernum cum armis suis." The essay on Dogs has, however, its livelier pages; as where the author speculates on the shock to the nerves of a dog of refinement implied in the very name of Dog-Latin, asserts for the English mastiff identity with the hounds of the Knights of Rhodes, which "could tell a Turk from a Christian by the smell," and subtly sets a vision of judgment before old maids, in the purgatory of two ladies "immoderately fond" in their lives "of little dogs," to which a monk of Bec appears to have been witness. To the list of monuments and epitaphs to favourite dogs might be added one at Harpton, by Sir G. C. Lewis, to a favourite Pomeranian which belonged to his stepmother; and corroboration of the just-shadowed-forth office of dog-whipper in connexion with churches might be gleaned (*passim*) from the Ludlow Churchwardens' Accounts, published in 1869 by the Camden Society.

But for wider-reaching interest the essay on Travelling in England deserves to be consulted, as it assesses the worth as cicerones of William of Worcester, Leland, Carew, Fuller, Stukeley, to say nothing of such later guides as Pennant and Horace Walpole. Mr. King takes his reader to Cornwall (he might have added Cambria North and South) for cromlechs and kistvaens; to Kent and Sussex for Roman remains and military architecture; to Penshurst and Knole for Tudor mansions of the best type; and to Petworth, Cobham, and Castle Howard for art treasures. The Roman wall and the Yorkshire Cistercian ruins suggest eloquent and enthusiastic sketches of possible model-tours, and—in a word—the essay enforces the wisdom of awakening the historic spirit in the youthful mind by well-chosen and distinct snatches of home-travel. Mr. King quotes of one such excursion the words of old Thomas Fuller: "If the tourist do not return from such an expedition *religiosior* or *doctior*, with more piety or learning, it is surely his own fault if he do not depart *juvundior*, with more pleasure and lawful delight" (p. 305); words which seem to have given a cue to Præd's verse about a sojourn at his Vicar's:—

"If he departed as he came,

With no new light on love or liquor,
Good sooth, the traveller was to blame,
And not the vicarage or the vicar."

It must not be omitted that Mr. King has a word or two for the fitting season of home-tours, and a hint in favour of spring, nay

even of winter, likely to be acceptable to those whose time is not their own.

The papers on Devonshire and the great shrines of England are, as it would seem, experiments at putting to the proof the general principles of that on travelling. As such they deserve study. No pedestrian can expect to economise time and tramping who does not, before starting on his tour, get up his subject with the Ordnance map, the handbook, and the best county history. So fortified he need miss neither the myths nor legends nor local worthies and their whereabouts. He would not then leave unvisited Powderham Castle with its legend of Lady Howard, or the home of the Bastards, the sole Devonian family which claims direct descent from an ancestor in the Exon Domesday; or the five Cistercian and six Benedictine abbeys of the county; or the twin names of Raleigh and Gilbert and their quondam haunts; or those of Sir Francis Drake, whose claim to coat-armour (p. 349) has been somewhat improved since Mr. King wrote his Devonshire paper. Nor would he fail to look out for the marble tabernacle in Exeter Cathedral which marks the rest of Dr. Anthony Sparrow, and has under it, in an enclosure of wood, effigies of the bishop's wife and his nine children. The little Sparrows and the wooden enclosure might present to the vivid imagination the fulfilment of the verse of the Psalmist (lxxxiv. 3), "Yea, the sparrow hath found her an house, &c." Of Devonshire poets Brown, Ford, and Herrick are cited, the first and second as indigenous, the third a sojourner. Gay may also put in a claim to Devonian birth, for he was born at Barnstaple; but as he was bred, apprenticed, and first noticed in London, he ranks more truly as a Cockney. Since the publication of these *Sketches and Studies* a truer Devonian poet, and prose writer—Charles Kingsley—has gone to his rest. Who so fit as Mr. King to write his *In Memoriam*? For a satisfying taste of Herrick's poesy it would be desirable to get a more copious draught than is afforded in "Robert Herrick and his Vicarage," the sole essay in the volume which gives us the means of judging its author's powers as a critic of poetry. His *métier* is rather discovered in such articles as "The Great Shrines of England," where almost the only notable shrine which is too summarily and scurvily dealt with is St. Werburgh's tomb at Chester (p. 207). As Bradshaw's Holy Life and History of that patroness of the city on the Dee is scarce and costly, this is the more to be regretted; and it might furnish Mr. King with a new theme for his archaeological and ecclesiolo-gical talents, if he would concentrate the research of a month or so to the Mercian saint and princess. The short sketch of "A Pilgrimage to St. David's" has a freshness that sets us upon the task of looking out our "staff and sandal shoon;" though the quaint and congenially described sketches of Louvain, Bruges, and the homes of Rubens and Teniers set up a counterblast in favour of seven-leagued boots for the Continent. Is there any chance of Mr. King's taking in hand the feasible task (has he not so described it?) of re-editing Prince's *Devonshire Worthies*, with the additions to be gained by modern research, with illustrations

from "good portraits, personal relics, ancient manor-houses, and sepulchral monuments" (p. 312)? Such a work would be as welcome as another, and yet another of those articles on county topography which the *Quarterly Review* metes out, only too sparingly, to a public predisposed to think it cannot have too much of them, and which lesser periodicals find their account in imitating.

If a fault is to be found in so pleasant a collection of papers as those under our notice, it is that in it, from the nature of the case, a hobby becomes more conspicuous than in single articles. Young sermon-writers are bidden to beware of "white-horses." Mr. King's "white-horse" is Dartmoor, which he could ride without notice or fault-finding through four or five several articles in the *Quarterly*, though when all are bound up together in an octavo volume there is a savour of sameness and repetition if the "wish-hounds" reappear every time we turn over a score of pages.

JAMES DAVIES.

The Life of Napoleon III., derived from State Records, from Unpublished Family Correspondence and from General Testimony. By Blanchard Jerrold. With Family Portraits in the possession of the Imperial Family, and Facsimiles of Letters of Napoleon I., Napoleon III., Queen Hortense, &c. In Four Volumes. Vol. II. (London: Longmans & Co., 1875.)

THOUGH the work of Mr. Blanchard Jerrold is announced to consist of four volumes, it is difficult to believe that it will not exceed that number. The first volume, which we noticed at the time of its publication, brought down the history of Prince Louis Napoleon to the time when, released by the clemency of King Louis Philippe from the punishment due to the attempt at Strasbourg, he landed in America; the second volume embraces the period of eleven years from 1837 to 1848. Will the author be able to relate in two volumes the history of the Presidency, the Empire, the catastrophe which brought it to a close, and the final exile and death of his hero? This seems very doubtful, and all the more so because what remains to be told is much more interesting and important than that which has already been related. But he delights in details. Thus he dwells at great length on the highly favourable impression made by the Prince in the United States during his very brief residence in 1837 of only two months. Having landed at Norfolk on March 30, he left New York on June 12 following, having been recalled to Europe by the serious illness of his mother. It was often said at that time that in returning to the Old World he broke a sacred engagement, a promise made to the French government which was the condition on which he had been set at liberty. Mr. Jerrold denies the fact, and we think on good grounds. Had he engaged not to return to Europe, the French government would not have failed to urge the violation of his parole against the Prince when they demanded his expulsion from the Swiss territory, but it does not appear that they advanced this argument. Nor was it urged at

the Boulogne trial, which seems to prove that no such engagement had been made, at least in writing.

But if the intrigues which tarnished the return of Louis Napoleon to Europe, and the subsequent expedition to Boulogne, do not constitute a violation of sworn faith, they nevertheless seem to us to be incompatible with the sense of honour which Mr. Jerrold much too readily ascribes to his hero. When set at liberty after an attempt of such a nature that the public prosecutor demanded capital punishment for his accomplices, Louis Napoleon could not but allow that to the clemency of Louis Philippe he owed, if not his life, at least his escape from a sentence of perpetual imprisonment, a boon which was but ill repaid by renewed conspiracy. But it appears that his conscience was above such scruples, and it is not difficult to perceive that he set little value on truth. On August 20, 1838, he wrote to a member of the Grand Council of Thurgau: "I returned from America to Switzerland a year ago with the firm resolution of remaining apart from every kind of intrigue. My determination has not changed." These assertions were absolutely untrue, as Mr. Jerrold himself indirectly admits. He exhibits the Prince in the castle of Gottlieben contemplating the storm threatening himself and Switzerland, and he adds:—

"It cannot be denied that during the winter he had helped somewhat to gather it. The companions of his solitude had been some of his associates of the Strasbourg expedition. He had been in consultation with Vaudrez, Parquin, Persigny, Laity, and others."

King Louis, having learnt what was occurring in Switzerland, had written stringent letters, and when they led to no result, he gave up all further correspondence.

In fact, at this time, Louis Napoleon was playing a double game of not too exalted a character. On one side he acted the part of a Swiss citizen, accepted the freedom of the city which was offered him by some communes of Aargau, allowed himself to be named president of a rifle company, and delivered a speech in which he called the Swiss his fellow-citizens (p. 53). On the other hand, under cover of this borrowed nationality, he renewed his intrigues against the French government, and again appears in the character of a pretender. He caused M. Laity to write a pamphlet intended to extol the Strasbourg expedition, and to show that it had presented great prospects of success. If we allow that to princes is assigned a morality quite different from that which is obligatory on ordinary citizens, such conduct may be understood; but to those who believe that all men are subject to the same moral laws, whatever may be their birth and station, the conduct of Louis Napoleon in Switzerland must appear unjustifiable.

But it cannot be maintained that the French Government was free from error. Mr. Jerrold is quite correct in pointing out the ill-judged character of its policy in judging M. Laity by the Chamber of Peers, which condemned him to five years' imprisonment, a fine of 10,000 francs, and to be under the surveillance of the police during his life

—a punishment certainly too severe for the crime of publishing a pamphlet (p. 54); and it was a still greater error to demand from Switzerland the expulsion of Louis Napoleon on the pain of war. The French Government thus played the game of their adversary; they magnified him by seeming to fear him. Misled by a regard to his own interest and by an instinctive dislike to the liberal and republican character of Switzerland, Louis Philippe invested with the dignity of an important personage the man whom general opinion regarded as a mere adventurer, and whom the Strasbourg freak had covered with ridicule.

Mr. Jerrold dwells much on these considerations, and would have us believe that the pamphlet of M. Laity was a snare successfully laid by the Prince for the French government, and that all the conduct of Louis Napoleon in Switzerland was the result of profound calculation. It seems to us that the author strains and exaggerates facts, as when he says at the close of this part of his work, "He [Louis Napoleon] had left London in the summer of 1837, an adventurer covered with ridicule; he returned in the autumn of 1838, a pretender to the throne of France."

The kind of prestige which Mr. Jerrold ascribes to his hero was increased, according to our author, by the publication in 1839 of the pamphlet entitled *Les Idées Napoléoniennes*, a pamphlet which produced "a profound sensation in France," and to which the author attached great importance. We may be permitted to differ from the former part of this opinion.

Napoleon I. was certainly an incomparable general and administrator, but he was as far as possible removed from liberal ideas: democracy was his horror; his desire, which the partisans of the Empire at the present day falsify unblushingly, was, perhaps, "all for the people," but with the addition of "nothing by the people;" never, in any degree, did he admit the idea of a self-governing nation, and the extent to which he reduced his Senate and Legislative Body to insignificance and degradation is well known. Under the Restoration, the liberals, in their hatred of the monarchy and of divine right, invented the legend of "the liberal Emperor," the revolutionary Napoleon propagating the principles of 1789 throughout all Europe by force of arms, those principles which the great captain detested and stigmatised as "ideology." Louis Napoleon made capital out of this legend, but the representation he has given of his uncle in the *Idées Napoléoniennes* is pure fiction. Apart from this representation we find in the work little more than what the French call "the truths of M. de la Polisse," that is to say, hackneyed generalities and empty declamations, with but few ideas. The only one at all prominent is defective both in truth and morality, viz., that material prosperity ought to satisfy a nation, and so long as this is granted they ought to be content. Napoleon I., having given to France much luxury, splendour and glory, and an administration as complete and skilful as possible, had no idea that anything further could be demanded of him, and that the French might desire in some degree to enjoy liberty, and

cherish the ambition of managing their own affairs.

This rule he applied to other nations. Spain had a weak and corrupt government open to manifold abuses, where prodigality and speculation were a daily scourge. Napoleon thought that when he gave her one of his brothers as king, and an administration formed on the model of that of France, and thus securing to her material prosperity, he would fulfil all her desires. He could never understand that the Spaniards would rather be badly governed by one of themselves than well governed by a foreigner, and he found in Spain the first check to his power.

Napoleon III., imbued with the same ideas, committed in Mexico the same unpardonable error. In his treatment of that empire the sole "*idée Napoléonienne*" was the ruling principle: material prosperity is sufficient for a nation. This is the policy of all the Caesars. The idea is false; material prosperity without liberty, without moral greatness, becomes an element of corruption and national degradation. Moreover, this idea is immoral; it ignores the highest necessities of the human soul, and sooner or later inflicts terrible catastrophes on those who have adopted it as their rule, forgetting that nations, no more than individuals, can "live by bread alone."

To return to the treatise of Louis Napoleon. We do not believe that it really contributed to his greatness. At any rate, he soon took care to destroy the kind of reputation which he owed, if not to this publication, at least to the faults of the French government, by entering upon a most foolish and culpable enterprise: on August 6, 1840, he landed at Boulogne.

In thus acting, did he merely throw himself headlong into the snare skilfully laid for him by the ministers of Louis Philippe? Mr. Jerrold inclines to the affirmative. But it appears to us that in the affair of Boulogne he was again involved in an irrational project. We believe that the enterprise offered no chance of success whatever. At Strasbourg the Prince had the co-operation of Colonel Vandrey, and he might have hoped that that officer would gain over his regiment. At Boulogne he had not a single good card in his hand. The only accomplice on whom he could rely was M. Aladineze, merely a lieutenant. He did not succeed in seducing his men, and the arrival of Captain Col-Puygellier was sufficient to force the Prince and his small company to evacuate the barracks. Not a man either in the army or the general population joined him, and those whom he had dressed out in French uniforms to present the appearance of belonging to the army being in no degree inclined for battle, nothing remained for him but flight. The future Emperor was rescued from the sea by a boat while endeavouring to swim to the steam-vessel which had brought him. This was a miserable check to a pretender who a few days before had named the Tuileries as a *rendezvous* to his friends. Mr. Jerrold acknowledges the failure to have been as complete as possible, and he even points out the causes to which it was due.

"His agents in France," he says, "were either foolish or dishonest. In short, he was not well

served. His followers were a motley throng of malcontents and adventurers. Not a score of them were reliable men, and hardly one was discreet or a man of resources. De Persigny was the leading conspirator, but he was rash and headstrong always; Montholon, Voisin, Parquin, were old and tried and valiant soldiers, but they were not of the stuff of which leaders of men are made." (pp. 125, 126.)

It would be difficult to be more severe. However, Mr. Jerrold maintains firmly that his hero was no fool, and that Bonapartism had struck its roots deeply in France, and that if the Prince had succeeded in getting possession of Boulogne, and had then marched upon Paris, he would have been received as a deliverer. There appears to us an evident contradiction to such assertions in the description drawn by the author himself of the miserable resources at the disposal of Louis Napoleon.

The remainder of the volume is occupied with the trial and condemnation of the Prince, his imprisonment at Ham, the literary occupations to which he devoted his leisure while a prisoner, his escape, his life in London, and his election as deputy in 1848. The admiration of Mr. Jerrold is seldom wanting, but, for ourselves, we do not perceive any remarkable result from the meditations of the prisoner at Ham. His writings possess little literary value. He was much occupied with the subject of artillery, and at a later time when he was Emperor, and absolute, his studies supplied the French army with one piece, the twelve-pounder, lightened so as to replace the eight-pounder of the day, but never actually brought into use; the rifled cannon, of which the author of the *Manual of Artillery* had never dreamed, having been invented by others at the time when the manufacture of the twelve-pounder lightened gun was being carried on on a large scale. Need we add that Napoleon III., who had studied these questions so closely, had not the slightest doubt in 1870 of the immense superiority of the Prussian artillery to the French?

In his studies connected with the canal of Nicaragua, it is difficult to see more than a prisoner's amusement. One who was not an engineer and who had never studied the question on the spot, could hardly offer any serious suggestion. Did he study the question of pauperism to greater profit? We can hardly think so, when we consider that during a reign of eighteen years he effected nothing in that department.

In short, the most remarkable act of Louis Napoleon at Ham was the effecting of his escape, after which his life in London presents nothing indicative of real greatness. He led a life of pleasure and dissipation: he appeared frequently on horseback; betted at races; lost much money; borrowed a little from all quarters; his surroundings were bad and his financial difficulties absorbed his time. Would he have renewed his intrigues? Perhaps he might, but scarcely had two years elapsed when the throne of Louis Philippe fell without his presence, and some months afterwards he re-entered France as deputy.

Thus closes Mr. Jerrold's second volume. In our notice of the first, we said that the work was less a history than a panegyric;

this defect is less apparent in the second volume. The author seems to have learnt that excessive exaggeration injures the case it would support; he sometimes puts a limit to his praises; he is still an advocate, but a more discreet in his pleading. In judging of Queen Hortense (pp. 41, 42, 43) Mr. Jerrold expresses himself with a degree of severity, too lenient in our view, but a little surprising to the readers of his former volume. Elsewhere he says of his hero, "Prince Louis was no saint either before, during, or after his residence in London. He had his full share of some of the fashionable vices" (p. 84). Yet what we miss in this second volume, as in the first, is a just appreciation of the faults and crimes of the Prince. Mr. Jerrold relates the story of Boulogne, as that of Strasbourg, without a word of censure for that inexcusable outrage. In short, during the whole of this first part of his life, Louis Napoleon appears only as an unskilful conspirator, and an adventurer and man of pleasure. He exhibits the strength which is imparted by constant pre-occupation, a fixed idea; but not one aim of moral greatness. ETIENNE COQUEL.

Round Games at Cards. By "Cavendish" (London: De la Rue & Co., 1875.)

"It has been found hard," says Dr. Johnson, "to describe man by an adequate definition." The term "*reasoning animal*" is objected to because so many of his race do not reason, while so many of his "poor earth-born companions" do. He has been called in preference a cooking animal, a laughing animal, a clothes-wearing animal, a tool-making animal, and so on. One of the latest definitions we have heard is that of a gambling animal, and judging by the extensive application of human intelligence to the transfer of property in this way, the definition would not seem inappropriate. If we direct our attention only to one of the many ingenious contrivances invented for the purpose, namely, playing cards, we may find material for a long study.

Volumes have been written on the antiquities, the symbolism, and the uses of these little tablets.* It is popularly supposed that they were invented as playthings for an insane king; this supposition being derived from the discovery of an entry, about 1393, of a sum paid by the treasurer of Charles VI. of France, to "*Jacquemin Gringonneur, peintre, pour trois jeux de cartes à or, et à diverses couleurs.*" But this passage proves nothing as to the invention of playing cards, which were really of much more ancient eastern origin. Even the name, in spite of the obvious *charia*, is supposed to have some connexion with an oriental word signifying four, the number of chief divisions in a pack. They are said to have been introduced into Spain by the gipsies in the fourteenth century, and the treasurer's entry may probably correspond with their first becoming known in the more northern countries of Europe.

Card-playing soon became popular. Early

* See Chatto's *History of Playing Cards*, an excellent work, too little known.

in the fifteenth century the gambling it introduced was forbidden by an order in council at Augsburg; and, as a counterblast, a fine was instituted at Bamberg upon any one who should throw the cards out of the window. In 1463 they had become so important an article of commerce in England that the importation of foreign cards was prohibited by Act of Parliament; in 1475, in a treatise "*De honestâ Voluptate*," card playing after dinner or supper was recommended as a gentle aid to healthy digestion, and in 1484 games at cards were specially included among the sober pleasures allowable at Christmas time. Henry VII. charged in his Privy Purse Budget several sums for losses at cards, and when his daughter Margaret in 1503 went to the castle of Newbattel, in Scotland, to become the Queen of James IV., "the Kynge came privily to the said castel and entred within the chamber with a small company, where he found the bride (then aged fourteen) playing at the cardes." James was so delighted that he took enthusiastically to the amusement himself, but with apparently bad results, as he was obliged the same year to give four French crowns "to Cuddy the Inglis later, to louse his cheyne of grotes, qu'hilk he tint at the cartis," i.e., to redeem property pledged at play. At the time of the plague at Rhodes, 1498, cards and other gambling apparatus, which were supposed to bring evil on the island, were ordered to be destroyed.

Card-playing was formerly, as it is now, a favourite recreation during long voyages; it was forbidden by the Duke of Medina in the Spanish Armada, but the followers of Columbus not only played, but made their own cards.

Catherine of Arragon was considered a thoroughly accomplished princess, as she could "play at tables, tick-tack or gleek (*glück*) with cards or dyce." Queen Mary indulged in the recreation after her severe religious exercises with the heretics, and Queen Elizabeth lost, not only her money, but her temper at the card-table. Louis XII. played in camp, in sight of his whole army.

In Spain all sorts of evil to the body, the soul, and the property were ascribed to card-playing; a book being published in 1557 "en que se declaran los daños que al cuerpo, y al alma, y al hazienda, se siguen del juego de los náipes." And a proverb says:—

"Tahur y ladron
Una cosa son."

Similarly the old verse—

"Ludens taxillis, bene respice quid sit in illis,
Mors tua, sors tua, res tua, spes tua, pendit in illis"—

served as a warning to gamblers.

In 1609, Henry IV. had to beg the indulgence of his finance ministers for his great losses at cards, and our own Court was not backward in the amusement, for Pepys relates that "on Sunday, February 17, 1667, he did finde the Queene, the Duchesse of York, and another or two at cards," at which instance of irreligion he expresses himself greatly amazed.

The designs of the cards we use are chiefly French, the uncouth figures of the picture cards (so obstinately adhered to in spite of

all attempts to modernise or improve them) being barbarous representations of old French court costumes. The king is very ancient; the queen is of modern invention, having been substituted for a general or prime minister; the knave (*Knabe*) is also old, and represents the serving-man. The analogy between cards and chess in regard to these characters is singular, and is thought by some to indicate a common origin.

The names and distinguishing figures of the four suits show some curious varieties in the different countries of Europe. Our hearts agree with the French *cœurs*, and the German *Herzen*; but in the Spanish and Italian cards their place is taken by goblets, *copas*, *coppe*. Our diamonds resemble the French *carreaux*, but the Spaniards and Italians use pieces of money, *oros*, *danari*, and the Germans bells, *Schellen*. Our term *spade* has nothing to do with the digging tool, but is taken from the Italian *spada*, sword, while the figure represents either the end of a spear, answering to the French *pique*, or a leaf, as in the corresponding German symbol *grün*. Our word *club* is a literal translation of the Spanish and Italian representatives *basto*, *bastone*, but the figure is the French *trèfle*, *trifolium*, or clover leaf, a form supposed to be derived from the more ancient acorn, still retained in the German *Eichel*.

We know but little of the earlier modes of playing adopted, but some curious names of games are on record. The fashionable game in Elizabeth's time was called *Primero*; in that of James I. it was *Maw*; and we hear of such odd games as *Noddy*, *Costly Colours*, *Wit and Reason*, *Plain Dealing*, *Queen Nazareen*, *Lanterloo*, *Pennecch*, *Beast*, *Mumchance*, *Tickle me quickly*, *My-sow-pigged*, *Look about ye*, &c., and a still longer and more curious list may be found in the *Gargantua* of Rabelais.

Most of the old games have become obsolete and have given place to others of more modern invention. In the present day card games are in use in considerable variety, and adapted for different numbers of players; as, for example, what are called round games, for a domestic circle of any diameter:—*Whist* and *Quadrille* for four persons; *Ombre* (an excellent game lately revived) for three; *Piquet*, *Cribbage* and others for two; and even some for one person, where the single player matches himself against the effect of chance as developed in the shuffling of the cards.

Card-playing has, to some extent, a literature. The game of *Whist* has hitherto received the most attention, and deservedly so, on account of its high intellectual character; but other games of a simpler kind should not be neglected, as they conduce to the amusement of larger numbers, and are adapted to players of more moderate powers.

For this reason, one of the best known writers on *Whist* (whose work on that subject we may possibly notice at a future time)

* "The queen of diamonds is Queen Nazareen, the knave of clubs is called Knave Knocker; if women play among men, it is customary for Knave Knocker to kiss Queen Nazareen." (Cotton's *Compleat Gamester*, 1680.)

It is a great omission of Cavendish not to have revived this pleasant game.

has done good service in bringing out the little book named at the head of this article. Round games furnish a source of much amusement to young people on winter evenings, but they are generally played according to uncertain and indefinite oral traditions; and the little that is said about them in ordinary books of games is often so badly written as to be useless, either in teaching the games to those who do not know them, or in promoting uniformity among those who do.

Cavendish's book describes, in a clear, intelligible way, three round games of some pretension, namely, *Loo*, *Vingt-et-un*, and *Poker*. The last is an American game, recently made known in this country by a little *brochure* on it, written by a person of high social standing, and it is now played, we believe, extensively in some fashionable circles. Hence we may assume that an authentic description of it will be acceptable to that large class who seek to model their amusements by the example of those above themselves in station.

The author, in addition to the descriptions of these games, appends short hints to aid the judgment, and gives for each a code of laws, which appear well-considered, and calculated to promote uniformity and fair play.

There are also added shorter descriptions of some other round games, of minor importance, namely, *Snip-snap-snor'em*, *Pope Joan*, *Spin*, *Commerce*, *My-bird-sings*, and *Speculation*: the latter an amusing pastime, which may possibly develop in the youthful gambler qualities that will be useful to him in after life, if his inclination should lead him to the Stock Exchange. W. POLS.

SCHOOL BOOKS.

Select Private Orations of Demosthenes. Part I. By F. A. Paley and J. C. Sandys. (Cambridge: University Press.) The Cambridge University Press has begun to follow the example set it some time ago by the sister institution at Oxford, and to take a leading part in the general movement for the improvement of our school-books. Every schoolmaster has had to lament the absence of convenient editions in English, not only of the less well-known classical authors, but of the less known works of those who hold the highest rank. Not only is there no available school edition of *Lucan*, *Statius*, *Seneca*, *Plutarch*, *Arrian*, *Lucian*, or the Greek lyric poets, but the greater part of *Livy*, *Tacitus*, and (until Mr. Mayor's edition is reprinted) *Juvenal* is not to be obtained with notes which will give the learner the assistance and information he requires in preparing his work, and the necessary help to the teacher who does not understand German. We are grateful to Messrs. Paley and Sandys for attempting in some degree to supply this gap. Mr. Paley has in the preface to his edition of *Euripides* expressed himself as an enemy of that over-fastidiousness which demands that a life's work shall be consecrated to the explanation of a single author, while the demand for immediate instruction is so great. His scholarship is sound and accurate, his experience of editing wide, and if he is content to devote his learning and abilities to the production of such manuals as these, they will be received with gratitude throughout the higher schools of the country. Mr. Sandys is deeply read in the German literature which bears upon his author, and the elucidation of matters of daily life, in the delineation of which *Demosthenes* is so rich, obtains full justice at his hands. In the

discussion of the legal questions contained in the orations, the editors have mainly followed Mr. C. R. Kennedy, who has, indeed, left little to be done by others in this department. We hope that this edition may lead the way to a more general study of these speeches in schools than has hitherto been possible; but the notes are so full that we should recommend schoolmasters to avail themselves of the opportunity given them of placing the Teubner text in the hands of their scholars for practical use in school. The index is extremely complete, and of great service to learners.

Mr. Watson, of Brasenose, has reprinted the *Epistles of Cicero*, of which the Clarendon Press has already published a large edition with notes. The one book can be of little use without the other, because the letters of Cicero cannot be understood without a great deal of explanation; at the same time the price of the larger work would preclude its being placed in the hands of school-boys. The epistles are well selected, and range from A.U.C. 630 when Cicero was forty-two years of age, to A.U.C. 711, the year of his death. Their subjects refer rather to public than private events, and were, we imagine, arranged with especial view to Oxford examinations in Ancient History. The printing and arrangement of the book are excellent, and it is well furnished with tables and indexes.

Messrs. Bagster have published an *Analytical Greek Testament*, and a small Greek grammar by William Penn, *How to Learn to Read the Greek Testament*. These books would seem to be of great use to those who, not having had a classical education, are anxious to read the New Testament in the original, and they would serve as excellent introductions to any adult into the study of Greek. In the first book the page is divided into two columns, the first containing the text, and the next each Greek word fully parsed. The second book consists of a New Testament Greek grammar arranged something after the plan of Ollendorf or Ahn. It is thoroughly scholarlike and correct, recognises sound philological principles from the first, and would in many respects compare favourably with the smaller grammars used in our large schools. Mr. Allen's *Elementary Latin Grammar*, published by the Clarendon Press, does not in many respects strike us so favourably. The author tells us in his preface that "in the treatment of Latin accidence the beaten tracks pointed out by immemorial usage have been generally adhered to." We do not think that any satisfactory grammar can be written which does not from the very first take account of the revolution which has taken place in the whole aspect of the subject, since the study of comparative grammar has become general. What is called comparative philology both in Greek and Latin should not be taught as a mere accessory after a false method and false results have been drilled into the mind, but should inform and direct the study of language from the earliest years, and we are sorry that the University of Oxford should lend its authority to a Latin grammar composed on a different plan. The syntax is drawn up in the form of a catechism, which we suppose implies that it is to be learnt by heart, a form of useless and deadening torture which we trusted was rapidly becoming extinct. The appendix contains a great deal of useful information and is the best part of the book. *A First Latin Reader*, by the Rev. T. J. Nunns (Oxford: Clarendon Press), is what in old days would have been called a delectus, and is apparently well calculated to answer its purpose. It is printed in clear and large type, which is important for children, and the explanations are very simple and good. The book gains additional value from having been written under the direction of so experienced a teacher as Mr. Cowley Powles. Messrs. Calvert and Saward, of Shrewsbury School, have issued *Selections from Livy*, books viii.-ix. (Rivingtons). It is one of a class of books which took their origin from Rugby under Dr. Temple, and which

might with advantage be indefinitely multiplied. We mean a short book of extracts containing enough Latin and Greek to last for one or two terms' work, furnished with notes and maps and explanations, and suitable for lower forms. By mutual arrangement between the schools, such books could be issued at a very low price, and the best talent of the teaching profession might be secured for them, while at the same time they could be made to range over a large extent of classical literature. The present work seems adequate to its purpose, but no book of this kind can have more than an ephemeral value. Mr. Millington's *Latin Exercises on Barbarism for Junior Students* (Longmans) contains in the modest form of a paper-covered pamphlet much useful information. Its twenty exercises could be quickly worked through by boys with interest and amusement, and they would not be likely to forget the lessons thus given to them. Dr. White's *Latin-English Dictionary for Middle Class Schools* (Longmans) appears to be good as far as it goes, and announces itself as cheap, but we have no means of ascertaining how far this is warranted. The same editor has also issued St. John's Gospel in the *Grammar School Texts* (Longmans). The Greek of the text is well printed, and the vocabulary is so composed as to form a very efficient introduction to the Greek language to those who are previously ignorant of it. It also contains much information etymological and exegetical in a small space. Mr. Lupton, in *Test and Competitive Geography* (Longmans), gives us for one shilling a book which is a bitter satire on our system of competitive examinations. It consists of forty-two pages of geography papers set in the Army, Navy, and Civil Service Examinations, and fifteen pages of introduction. The student is told in the preface that if he will carefully get up the first fifteen pages of this little book, he will be able to answer the accompanying papers with the assistance of any of the ordinary text-books on geography. For the credit of the examiners we may say that we do not think that this promise would be justified by the result, unless the "ordinary Text Books" contained very full information. But a system must be wrong which can allow such promises to be made, and which can offer distinction and marks to the hasty cramming of undigested and in many cases useless knowledge equal to what may be gained by long and careful study of language and literature. "An anonymous writer from Glasgow" urges the importance of teaching the "laws and constitution" of our country "in schools." We agree with his conclusions, but we do not think that his arguments will convince any one who is of a different opinion. We must conclude with two little books on Greek and Roman History: *A Catechism of Grecian History*, by E. M. Sewell (Longmans), and *Outlines of Roman History*, by Rev. B. G. Johns (Lockwoods): we cannot imagine under what circumstances it is desirable to teach history by a catechism. Such a system of instruction only commands general approbation where it is necessary to impart formulae or doctrines, every word of which is important. This cannot be the case with history, since in the ordinary manuals the statements are quite as often false as true. Miss Sewell's book is no exception to this rule, although she has avoided glaring absurdities. Mr. Johns's *Roman History* is as bad as it can be. It is painful to think that such trash should find a sale, or that any author so grossly ignorant of his subject should be editor of a School Library. Yet he tells us in the preface that "the work has been written and arranged on the most approved system of modern instruction for the young;" and that "facts dug out from the brain's quarry by the exercise of thought and memory are of double value."

OSCAR BROWNING.

Il Progresso is the title of a monthly review published at Genoa. It is devoted to scientific discovery, inventions, and industrial art.

NOTES AND NEWS.

PROFESSOR CAIRNES'S *Logical Method of Political Economy* has long been out of print. A new edition, enlarged and revised, will shortly be published.

WE understand that the novel called *The Harbour Bar*, recently published by Messrs. Macmillan, is by the wife of the present Professor of Geology at Oxford.

WE are informed that a work which has been long looked for will be in the printer's hands some time during next month. It consists of selections from the minutes and other official writings of Major-General Sir Thomas Munro, Bart., K.C.B., sometime Governor of Madras. It will be edited by Sir Alexander Arbuthnot, K.C.S.I. Messrs. Henry S. King & Co. are to be the publishers.

THE literary remains of Wilhelm von Kaulbach are reported to be of great value from an historical, as well as an artistic point of view, and include an extensive correspondence on the subject of his paintings of the Reformation-period, with Ranke, Olfers, Müller, Bethmann-Holweg, and many others celebrated in the ranks of history and literature. One of the most characteristic of these earlier literary remains is the painter's sketch-book-diary of his first impressions of Munich, as seen in 1826.

STRANGE things come to pass in India. A prize was offered by the Elphinstone College for the best poem in Sanskrit on Buddha, the great heretic, whose followers were extirpated in India by the Brahmans to the last man. Now a young Hindu pupil, Govinda Wasudeva Kanitkar, writes a panegyric on the great religious reformer in very fair Sanskrit verse, and receives the well-deserved prize. His poem has been printed at Bombay at the Induprakas Press.

SOME time ago a proposal was made to the British and Foreign Bible Society to print a translation of the Bible in the Platt-Deutsch of Schleswig-Holstein. It was doubted at the time whether there was a real demand for such a translation. The *Neue Zeitung* of February 6, 1875, published at Brecklum, contains a letter from a clergyman who states that one-third of his congregation are unable to understand a sermon in High German, and that he would give anything for a copy of the old Low-German translation of the Bible by Bugenhagen, which was formerly used in Schleswig-Holstein, but is now out of print. Would not the Bible Society feel justified in supplying that want?

In the just-issued catalogue of the first part of the late M. Guizot's library, the lots on English History run from number 1,690 to number 2,037, both inclusive, and contain a great many presentation copies from authors. Among the rare tracts is that very rare one edited by Lord Aberdeen, of which only ten copies were printed, *Négociations de M. le Comte d'Avaux en Irlande*, 1689-90.

MR. W. R. S. RALSTON is to lecture on "Popular Tales: their Origin and Meaning," at the Royal Institution on Friday next, the 26th inst.

MR. KINLOCH, of Edinburgh, has allowed a copy of his old Ballad Manuscript to be made, by Mr. William MacMath, for Harvard College Library, U.S., where Professor Child can use it for his new Collection of Ballads. For the same library and purpose a copy is now being made of Mr. William Chappell's digested Index of the Roxburghe, Pepys, Bayford, Wood, Rawlinson, and other collections, which were first indexed for the Ballad Society. The earliest copy of the *Lytell Geste of Robyn Hode* in the Bodleian is also being copied for the Harvard Library, which will soon be the richest library in the world in copies of collections of MS. ballads.

M. DUMAS' reception at the Academy on the 11th inst. was rather like a triumph over that illustrious body. They are mostly Orleanists; he

on the fidelity of his predecessor, M. Lebrun was an innovator once: he reminded them that his own father was not an innovator. The rest of his speech was taken by a polished and audacious vindication of his plays, which he obviously hoped would rock M. Lebrun as M. Augier's *Mariage* had done, and with an explanation—in which he accounted for the failure of M. Lebrun's play, which was not like Corneille's—of Richelieu's success on Corneille's first masterpiece. The action, though put extravagantly, is not plausible: it is that a politician in M. d'Haussonville, in his reply, made a happy point, that two years before M. Lebrun had rebuked M. Augier he had recommended the author of *La Dame aux Camélias* and *de Lys* for a prize, never actually awarded, Napoleon III. meant to give to the most young dramatist to be found; he made a less legitimate point by putting the conclusion, "Elle m'a résistée, j'en ai assassinée," in juxtaposition with the famous "Tue-la." In his opinion, he assured M. Dumas that the Academy is the true republic; that though the world might draw invidious distinctions, all dramatists regarded each other as equals, and M. Lebrun was a very charming old gentle-

man. The British Scandinavian Society held its first meeting on the 5th instant. Its objects are to increase the intellectual connexion between England and Scandinavia, to afford information of the kinds to persons about to visit the North, to gather together all the various persons in one way or another devote themselves to the study of these countries. The Society proposes to publish papers of a philological and historical kind, and to commence a lending library of Scandinavian books and journals.

At the time ago we noticed the remarkable collection presented to the Birmingham Library by Mr. William Bragge, F.S.A. An American paper states that *Don Quixote*, its first publication to 1868, had passed through 1,175 editions. Of these 417 were Spanish, 301 English, 169 French, 96 Italian, Portuguese, 70 German, 13 Swedish, 8 Polish, 4 Greek, 4 Russian, 2 Roumanian, 2 Catalan, Basque, and 1 Latin. In the Cervantes edition of M. W. Thebuefsen, of Würtemberg, there are samples of all these editions.

The *Revista de España*, Don Pelayo Alcalá Galiano notices the life and works of Don José de Rios, whose discoveries are said by a Spanish writer to have completely changed the science of nautical astronomy. Mendoza was in London on a scientific mission, when war broke out between England and Spain. Declining to fight, he was expelled from the Spanish navy by the government. He had married an English woman, and it is conjectured that family troubles were the occasion of his suicide at Brighton, in 1816. Señor Galiano's article is in part made up from inedited material, and corrects the mistakes of some previous biographers.

The last number of the Journal of the North China Branch of the Royal Asiatic Society, published at Shanghai last year, consists of several interesting articles. One of these—on Chinese Mythology, by T. Watters—contains much curious information on the popular belief in the transmigration of the fox into the form of a beautiful woman. The *modus operandi* is as follows:—"The fox goes to a height and bows in reverence to Tei-tou or Ursa Major, before he attempts the

feat. And the reason for his doing so is that the Tei-tou is the star which controls life, and its offended power might put an end to his existence at once. Then he proceeds to an old grave, scoops the earth out until he gets a skull, and places this carefully on his head. When he has it properly balanced and can walk without letting it fall, the rest of the process of transformation proceeds with magic speed. The tail is sometimes made to appear as a handmaid, and sometimes it is converted into a petticoat. Rouge, powder, silks, and jewels all come at a wave of the paw, and then she practises a mincing walk and a winning smile and a bashful demeanour, and goes to the lonely places in the country."

THE *Deutsche Rundschau* seems likely to solve a problem which has hitherto baffled German enterprise, viz., how to create a journal that should have the same position and influence all over Germany which the *Revue des Deux Mondes* has in France, and which the *Edinburgh and Quarterly Reviews* still hold, though by a more and more contested tenure, in England. Germany is rich in special journals, but, owing to the great division of all scientific labour, owing also to the small number of educated persons who combine sufficient means and leisure with scientific or literary interests, journals planned on the model of the leading French and English Reviews have always failed to secure a large public or even a sufficient staff of competent contributors. We pointed out before some excellent contributions in the earlier numbers of the *Deutsche Rundschau*, and we are delighted to see in the January number not only a most striking and powerfully written novel, the "Geier-Wally," by Wilhelmine von Hillern, but articles by Jacob Bernays, the great Greek scholar; by Bamberger, the well-known political economist; by Karl Hillebrand, the brilliant essayist, himself the editor of a new German journal, the *Italia*, and others. If German writers once know that there is a journal in which whatever they write will be read by the whole intellectual aristocracy of the country, that new stimulus will soon begin to act, and induce even those to write in an intelligible language who hitherto took a kind of pride in a German style that should be more uncouth than mediaeval Latin or Rabbinical Hebrew.

A SWEDISH translation of Professor Max Müller's *Lectures on the Science of Religion* has just been published at Stockholm. The title is "*Inledning till den Religionsvetenskapen*. Fyra Föreläsningar af F. Max Müller, Professor i Strassburg, Utländsk Ledamot af Franska Institutet. Översättning af Fredrik Fehr, Pastorsadjunkt vid St. Nikolai i Stockholm, Docent i Hebreiska. 1874."

THE *Nation* announces that a work on Harvard University, to be published by subscription, is on the eve of making its appearance. A prominent feature is a History of the College, by Samuel Eliot. The *Nation* also congratulates its readers on the acquisition of Mr. E. G. Squier's collection of American antiquities by the American Museum of Natural History in Central Park, New York.

Polybiblion quotes from a provincial paper the statement that several autograph letters of Henry IV. have been discovered at the Château de Lérans, in the department of the Ariège. We regret to see that the same journal has transformed *Tristram Shandy* into *Scitdam Skandy*!

We learn from *Polybiblion* that Count Riant has had the good fortune to discover the works of Guy du Bazoches, a chronicler of the end of the twelfth century, which have been frequently quoted, but hitherto considered as totally lost. These works consist of a *Chronographia*, comprising seven books, the last of which contains valuable details on the history of France and England in the twelfth century, and thirty-six letters. M. Riant has proposed to the Minister of Public Instruction to include them in the collection of unpublished documents.

A NEW life of Giovanni Santi, the father of Raphael, will be published shortly in *Il Raffaello* by the editor, the Count Pompeo Gherardi.

A CHEAP edition of Italian classics is now being published in numbers in Italy. It begins with the *Decameron*, illustrated by Signor Sanesi.

A GREAT stir has been caused in Copenhagen by a student of twenty, the youngest son of Bishop Grundtvig, the poet and politician, who died in 1872. This young man has published an "Epistle in Rhyme to Grundtvig's Friends," which has made a great commotion, and run already through six editions. The son appeals against the way in which the democratic party quote the name of his father in support of their violent theories, with which, he contends, the old poet thoroughly disagreed. The poem has also provoked an answer from Bjørnsen in Rome, as undignified and rabid as all that unfortunate demagogue's late oracles have been. The Norwegian poet, writing from Rome, poses as the father of his country, and expresses himself with a patronising air about Denmark that has aroused considerable amusement.

PROFESSOR CEDERSCHÖLD in Lund has brought out, and dedicated to Mr. G. Vigfússon in Oxford, a text of the *Geisli* or *Ólafsdrápa*, an Icelandic poem of the twelfth century, written, it would seem, in the year 1154, when Geisli pronounced it in the Cathedral of Nidaros (Thronhjelm) at the erection of that see into an independent diocese. Its interest appears to be principally philological.

THE double number of *Dit Nittende Aarhundrede* for January and February contains an interesting Essay on the Marble Statues of the Emperors of Rome, by the eminent Swedish art-critic, Viktor Rydberg, who writes, he it said, on this occasion in Danish; and an able paper by the editor, Dr. Brandes, on Ferdinand Lassalle. The magazine is a little less literary and less lively than usual.

THE Danes are hurrying on rather too fast in their criticisms of English thought and literature. Their best paper, *Daybladet*, remarked the other day that Mr. Herbert Spencer was evidently a very young man, but certainly of Titanic views (!), and a youth of whom it might reasonably be hoped that time would give him greater courage. He was a disciple of Stuart Mill, who undoubtedly had gained confidence with years; and much more of an equally amusing kind. There is something rotten in the erudition of Denmark.

A NEW weekly publication, entitled *L'Explorateur*, intended to promote the study of commercial geography, has just been established in Paris. The editor is M. Hertz, of the French Geographical Society.

IN our last Paris Letter (February 6), it should have been said that the new edition of *La France Protestante* would be complete in twelve, instead of in five volumes.

THE following Parliamentary Papers have lately been published:—Reports to the Home Secretary on the State of the Law relating to Brutal Assaults, &c. (price 1s. 10d.); Information furnished to the Home Secretary from Edinburgh, Glasgow, and Liverpool, on the Operation of their respective Improvements and Sanitary Acts (price 6d.); Report by the Special Commissioners on the Tweed Fisheries Acts, with a Plan of the River (price 1s. 8d.); Correspondence relating to the Queen's Jurisdiction on the Gold Coast, and the Abolition of Slavery within the Protectorate (price 6d.); Correspondence relating to the Affairs of the Gold Coast, with a Sketch (price 1s. 9d.); Commercial Reports from H. M. Consuls in China, No. 1 (price 4½d.); Correspondence respecting the Cession of Fiji, and the provisional arrangements made for administering the Government, with a map (price 1s. 3d.); Papers, &c. on the Siam Treaty, the Brussels Conference on the Rules of Military Warfare, and the Ottoman Loan of 1862; Report of the Endowed Schools Commissioners (price 4d.);

Report on the Administration of the Forest Department in the Provinces of India, 1872-73, by B. H. Baden-Powell (price 9d.); Seventeenth Report of the Commissioners of Inland Revenue (price 6d.); Annual Report of the Director of the National Gallery, for 1874, &c.

WE have received *Cremation of the Dead; its History and Bearings upon Public Health*, by W. Eassie, C.E. (Smith, Elder & Co.); *Sursum Corda*, by the Rev. W. Guise Tucker (Elliot Stock); *Common Sense about Government Offices*, by S. (Stanford); *Journal of the National Indian Association*, No. 50 (H. S. King & Co.); *The Pathological Significance of Nematode Haematozoa*, by T. R. Lewis, M.B. (Calcutta: Office of the Superintendent of Government Printing); *A Report of Microscopical and Physiological Researches into the Nature of the Agent or Agents producing Cholera*, second series, by T. R. Lewis, M.B., and D. D. Cunningham, M.B. (ditto); *The Year Book of Women's Work*, edited by L. M. H. (Labour News Publishing Offices); *A Manual of Veterinary Sanitary Science and Police* (Chapman & Hall); *Diseases of the Kidney*, by W. H. Dickinson, M.D., Part I. (Longmans); *De Pronominebus Arabicis Dissertatio Etymologica*, scripsit Carolus Eneburg (Helsingforsiae: typis Frenchellianis).

NOTES OF TRAVEL.

MUCH of the success of the expedition from Mandalay to Yunnan, under Colonel Horace Browne and Mr. Ney Elias, the despatch of which we recently announced, will probably depend on active co-operation on the side of China. We are glad, therefore, to have received intelligence that Mr. Augustus Raymond Margary, of the Consular Service, was some 160 miles above Hangkow, on the Yang-tze, on October 27 last, proceeding to Yunnan. It is important that Mr. Margary, whose adventurous journey certainly merits success, should reach Tali, the former capital of the Yunnan rebel kingdom, so as to meet Colonel Browne. Most valuable results may be expected from their joint efforts.

THE United States government, after having surveyed several other routes for a ship canal from the Atlantic to the Pacific, has now resolved to make a close examination of the line from Panama to near Aspinwall. The surveying officers arrived at the latter port on the 14th of last month, under the command of Captain Lull, U.S.N. He will commence the survey at a point midway between Panama and Aspinwall, dividing his party so that one may work towards the Pacific and the other to the Atlantic. This is the sixth expedition sent by the United States to report upon the various routes for a ship canal; and it is now hoped by the people of Panama that the final decision may be in their favour. But a second expedition, under Lieutenant Collins, U.S.N., proceeds to the river Atrato, to make a further examination of the alternative Darien route.

THE current number of the *Alpine Journal* (vol. vii., No. 47) contains an account by Mr. Gardiner of his ascent of Elbruz, in the Caucasus, from which it appears that the party reached a different summit from that ascended by Mr. Freshfield's party in 1868. This conclusion Mr. Freshfield endorses in a note. Mr. Brooksbank describes his passage of the Laquin and Rossboden passes, and other explorations in the Simplon district, a portion of the Alps which, considering its accessibility and its various attractions, seems to have been singularly neglected by mountaineers. Mr. Coolidge continues his narrative of Explorations in Dauphiné, a district which, notwithstanding the previous explorations of Messrs. Tucker, Whymper, and others, he has almost made his own. The summary of new expeditions shows from its array of unfamiliar names how completely the more familiar parts of the Alps have been worked out. At the conclusion of this section the editor ap-

pends a note of salutary warning which cannot have too great publicity in these days of adventurous climbing:—

"Now that the peaks and passes tempting to ambitious climbers can be counted on the fingers, it is natural that every foot of ground over 10,000 feet should be examined with interest, and every possible passage attempted. But there is some reason to fear that, in the present disposition to try everything, one of the most essential rules of mountaineering may be disregarded. In former days a good guide could scarcely be induced to undertake an expedition which involved venturing for any length of time upon ground habitually swept by avalanches or stonefalls. The instinct which led him to recognise and avoid such places was valued as an important part of his professional skill. Should climbing enthusiasm ever overcome this instinct, and lead guides and their companions frequently to expose themselves to the danger of being swept away, we must be prepared for a succession of terrible accidents. Mountaineering, properly pursued, is, for the most part, a game of skill, and it ought not to be turned into mere gambling with fate. The Alpine Club, by encouraging 'new expeditions,' incurs some responsibility, and this seems the proper place to suggest a caution, the need of which is strongly felt by many of its members. It is better to offer a warning in season than to draw a moral from an irretrievable disaster."

H. B. G. gives a short and genial account of the Festival of the Swiss Alpine Club, held last year at Sion. The "Jahrbuch" of the Swiss Club is well known to most Alpine travellers, but the following Alpine note may be of interest to some readers:—

"The Italian Alpine Club is now publishing a monthly journal under the title of *L'Alpinista*. The annual subscription for England is 6 fr. 50 c., and orders should be sent to G. Candelelli, 3 Via Rossini, Turin. The German Alpine Club will commence this year publishing a journal appearing six times a year. The subscription, not including postage, will be 5 fr. yearly. Orders will be received at Zimmer's Library, Frankfurt-on-the-Main."

ACCORDING to recent letters from Adelaide, Mr. Giles had started on December 1 for Port Lincoln, whence he intended to push his way by Port Eucla in a northerly direction, through hitherto unexplored districts, to the Musgrave and Tomkinson Mountains, on the slopes of which it is believed that good pasture-land is to be found. The explorer hopes to be able to complete this work in three months, at the end of which time he is to be met by Mr. John Ross with the supplies necessary for venturing upon a new attempt to penetrate to the West Australian coast-line between 28° and 30° lat. Mr. Ross is to start from Beltana and carry with him a number of camels from the cattle-run of Mr. Elder, who has more than 600 of these animals on his lands, and has not only supplied the necessary number for this expedition, but has taken upon himself the entire pecuniary responsibility of it. The same route will be followed which Mr. Ross attempted without success last spring, and which involves a journey of 600 miles through lands never yet trodden by the foot of a white man; but the explorers are sanguine that with the means now at their disposal they will be able to effect their object, and to reach the inhabited settlements of Western Australia by the proposed route.

THE official *Turkestan Gazette* announces that the preliminary works for a canal across the Hunger Steppe have been commenced. The canal will be fed by the waters of the Syr Daria, and derive therefrom 1,200 cubic feet of water per second for irrigation purposes. This will be a great boon to the inhabitants in the neighbourhood of Khojend and Jizak, as owing to the dearth of water arable land is there very scarce.

FROM the reports furnished to the Minister of the Interior at St. Petersburg, it appears that the Nijni-Novgorod fair of 1874 was very successful, merchandise to the value of 180,000,000 roubles having been brought together, and business to the amount of 165,000,000 having been done. This

surpasses the results of all previous fairs, not excepting that of 1872, which was a very prosperous year. There were very few failures, and these confined to tea merchants, while silver being plentiful the rate of exchange was easy throughout.

THREE French expeditions propose to traverse various portions of Western Africa during the ensuing year. M. Largeau is reconnoitring with a view to reach Salah, capital of the oasis of Touat, an intermediary mart between Timbuctoo and the Mediterranean coast. This journey is attended with considerable danger, owing to the hatred which the inhabitants of the Sahara entertain for Europeans. Through the aid of the French Consul at Mogador commercial relations have been opened up with Timbuctoo from the side of Morocco. A trusty native named Mardochée will be despatched shortly to strengthen these bonds, and there is every probability of a successful result, some of the Mussulman chiefs about the Upper Niger having already made advances of friendship towards France. M. le Marquis de Compiègne intends, should his health permit, to journey into the interior from the Gulf of Guinea, and M. Bonnat is endeavouring to establish trading stations along the course of the Volta.

SOME apprehension has been raised in Russia that the proposed draining of the vast marshes near Pinsk, in the west of the empire, will diminish the flow of water in the Dnieper, and thence occasion unforeseen mischief. The *Golos* effectually answers this by the remark that the Dnieper has been abnormally low for some time, and the preliminary levelling for draining the marshes is not yet finished, therefore it is clearly impossible for the one to be the result of the other. But, as a matter of fact, the restricting of the present mass of stagnant water to properly constructed channels will really increase the flow of the Pripiet and Beresina. The *Golos* is very strongly convinced that the real reason of the lowness of the Dnieper is the profligate deforestation which has been going on for some years past. In Smolensk the acreage of land covered with timber has diminished forty per cent. since the year 1850, in Chernigof thirty-one per cent., and proportionately in many other provinces. It is most necessary that the economic importance of forest conservancy should receive that attention in Russia which nearly all European states have for some time bestowed on it.

AMERICAN SCHOLARS AND THE "ACADEMY."

WE have always tried to keep our readers well informed with regard to anything that seemed to us really important in the literary and scientific journals of America. We have not only a larger staff of correspondents in America than any other weekly journal, but we carefully examine the best American papers, and we have frequently been the first to call attention to the excellent work done by American students in the various departments of art, literature, and science. In doing this, we wish to be considered as reporters only, and we are obliged to leave the responsibility for the statements which we repeat to the American journals themselves. We cannot mix ourselves up with their quarrels; but we have always been willing, when we receive any reclamations, to follow the principle of *Audiat et altera pars*, and let each party state its case from its own point of view. Thus we informed our readers in the *ACADEMY* of November 21 that "the colossal statue of Adonis, which was said to have been discovered in America, and which Professor Schlottmann, at the Congress of Philologists at Innsbruck, declared to be of Phœnician origin, had been proved to be a forgery." We added, that "as the statue is ten feet long, and made of alabaster, the expense of the forgery must have been considerable." Soon after we had inserted this notice, we received a communication,

including a copy of the *New Haven Daily Palladium*, in which it was stated that, whatever might be thought in England and Germany, there was in America considerable difference of opinion on the subject. In forming our own judgment, we had chiefly relied on the report of a meeting of the Oriental Society. But when we were informed that Dr. White, Professor of Pathology and Microscopy in Yale College, and himself a Member of the American Oriental Society, pronounced the stories (not *all* the stories) of the recent manufacture of the statue of Adonis in plain Saxon as *lies*, could we, in common fairness, decline to insert that rejoinder? What our own opinion was, if we had a right to form an opinion by mere authority, we had clearly shown by our first notice, and even in inserting extracts from Mr. MacWhorter's letter, we added: "Everybody imagined the matter was at an end. Would the American Oriental Society allow such a report to be published? Would not some of its members utter a warning, if the confession of the culprit admitted of any doubt? Here were the great scholars of America making merry of the scholars of Germany; and now we are told that, after all, the matter is by no means certain." Here, no doubt, we might have left the controversy, particularly as it had entered a phase in which it was of interest to the criminal lawyer rather than to the scholar; but as on reading through the files of American papers, not excluding the journals of learned societies, we had often been struck by the great freedom which American scholars allow themselves in expressing differences of opinion, we thought we might for once express our surprise at this abuse of language. In following this one controversy about the Phœnician Adonis, we had culled the following phrases:—"Certain stories of the recent manufacture of the statue are in plain Saxon *lies*." This language was attributed to a Professor of Yale College, a member of the Oriental Society. Another member of the same society speaks of "that exploded humbug," and adds: "If German scholars have been incautious enough to have been taken in by so gross a cheat, they have no one but themselves to blame for it." First, is that quite true? and, if it was, is it courteous to a scholar like Schlottmann, who may have been taken in as much as a Professor of Microscopy at Yale College, but who as a Semitic scholar has established as good claims at least to respect as any member of the American Oriental Society. When, lastly, we saw that Mr. MacWhorter, who may or may not be a member of the Oriental Society, taunted that Society with having had one of its members *hanged*, we could not help saying, "When will American scholars learn to speak gently?" Seeing in the same number of the *New Haven Palladium* from which we took Mr. MacWhorter's letter, the account of a "Lacerated actress attempting to cow-hide an editor," which we thought meant not much more than "an aggrieved actress venturing gently to remonstrate with an editor," we quoted it as a warning against the use of volcanic language, which, as we could prove by abundant evidence, has deposited its slugs even in the volumes of learned societies.

We have now confessed all our sins; and now for the punishment inflicted on us by the *Nation*, an American paper to which Mr. Whitney, Mr. Trumbull, and other members of the American Oriental Society are frequent contributors. We are told that "the ACADEMY has elected to stand as one of the godfathers of the statue of Adonis discovered in America." Our files are open to inspection, and though we shall not speak in *plain Saxon*, yet we feel justified in saying that the statement is inaccurate. Secondly, as we had called the Phœnician statue an apple of discord among American scholars, we are treated to the following witticism:—

"Fancy the good Dr. Schlottmann figuring in the attitude of Persica's Columbus—as 'Discordia tetra,' poising in air the ponderous *malum*

(the Latin word is convenient here) to bowl it back over the Atlantic, to the discomfiture of American scholars."

Here also we admire the flight of imagination; but before they again attempt any classical puns, we should recommend to the correspondents of the *Nation* a little more prosodial accuracy.—EDITOR.

P.S. In the *New Haven Palladium* of January 28, just received, Mr. Alexander MacWhorter controverts Mr. Trumbull's statements, and calls for a legal investigation of the whole case.

LETTERS OF JOSEPH SPENCE.

WE take the following glimpses of life abroad in the last century from a volume of original letters (recently placed in the British Museum), addressed by the Rev. Joseph Spence—the friend of Pope, the author of *Polymetis*, and the compiler of the *Anecdotes*, first published about half a century ago—to his mother. They were written by Spence during his educational tours with two or three young noblemen. The freedom of style and sentiment in some of these compositions, even when the relationship between the parties is considered, will not surprise those to whom other printed epistolary productions of that age are familiar.

"Dijon: March 1 NS., 1731.

"My Lord [Lincoln] lives in part of a merchant's house, whose wife & I are grown extremely acquainted. I believe I might make a cuckold of my Landlord, whenever I had a mind to it: but such a villainy is not in my nature. She is sometimes half y^e day together in my chamber; & as she is eternally talking French, & I always endeavouring to answer her, she has really done me more good y^e way than my Fr. Master. She is about five & thirty or by our Lady forty years old: but for ever brisk, & for ever talkative. When I don't understand what she says, or she does not understand what I say, we always fall a laughing: so that 'tis a merry method of learning a language."

"Hague: June 11, 1737.

"We went first to Leyden, where we saw y^e famous Dr. Boerhave, & heard him give a lecture. I had heard he was an ugly mean-looking man; but I can't think so. Nothing indeed can be plainer than his dress; but y^e dress with me has nothing to do with the man. His look is good-natur'd & open, and tho' he is within a year of 70, there's a freshness and clearness in his face that makes him appear almost a young man. There's a great simplicity in his prescriptions; the things he orders are plain and easy; and he's a great enemy to loading people with Powders & viols. I suppose he has follow'd y^e same method for himself; and by that means has preserv'd the youthfulness of his complexion to the last."

"Turin: Decr 23, 1739.

"I gave you an account in my last of the place we live in; & of the Governours of this Ark of Noah, into which they have collected Beasts from all Quarters of the world. I am now to tell you who are the good company in it, that dine in y^e Cabin that I belong to.

"Next me (to use Cardinal Wolsey's stile) is seated my good L^d Lincoln; and then, a wild Irishman. The next in y^e circle is a young, plump, rosy cheek'd marquis; his Title is Marquis of Leghorn. You know I have a great knack in finding out the likeness of some Beast in the features, sometimes, of a very honest man. One day I happen'd to whisper that this marquis was like a Sucking-Pigg, & I believe he will carry that name to his grave. He is attended by a sensible-looking, well-behav'd Roman Abbé. Then sits a thin-jaw'd black marquis, from Sardinia; they call him the Sarde; which as it is a very common name for a Horse here, and as his Features have a very near resemblance to that animal, we always talk of him together under that character. If he comes brisk into a room, 'tis, see how the Marquis prances; & if he sneezes, we say he neighs. By the help of a bad countenance he has pass'd himself so absolutely upon me for a Horse, that I don't care to slide between him & the wall at any time; for fear he s^d kick up behind: tho' the creature is very gentle & good-natur'd especially over his Provender. The next is a Gentleman from Poland, whose house is on the

farthest borders of that country, within a dozen mile of the Turks. He's of a square make & meek disposition; extremely devout & very obliging; un-talkative; tolerably read and a great dealer in Relicks. His Governour comes from Prussia; & if Eating & Drinking were acts of Religion, wou'd be more religious than his master. He has a tongue that runs very glib after meals; but all dinner time the man has something else to do than to talk. 'Twou'd do you good to see how feelingly he eyes a fat capon; & with what perseverance he continues drawing at a Bumper. He has a most lasting breath: & after dinner his Belly what with eating & what with drinking, is as hard as a Rock. It rounds out in a semi-circle before him; & wou'd look stately, were he not of so short & squat figure; somewhat (if I may use such a Similie to an ancient Lady) resembling that most necessary utensil (*sic*) commonly call'd a ———. Within a yard and a half of his chair, (for the juttings out of his make wou't let any body come nearer to it) sits a modest, simpering Doctor of the University here; & after him, a jolly, laughable, gentleman-like Earl of this country. Did you ever read Bishop Burnet's Travels? He says when he was in Switzerland, the chief man in that country was one Mr. D'Erlack; & he gives him a very fine character. The present heir of this family is the next man at our table—a young Gentleman of about 17; a sensible genteel pretty person, & extremely well-behaved; he is a captain in this king's service, tho' he has so much sweetness in look & temper, & does his exercises as well as any body in the Academy. Then follows a perfect German Earl, that talks so fast and stares so about him, & is so full of tittering and uncertainty in his carriage, that one wou'd think he had not been in the world above two or three hours; & indeed, to say the truth, he is but just come from College. His Governour is a tall raw-bon'd man from Bohemia; with a green coat as old at least as himself (for he is not above sixty-seven years old), and a hat that may possibly have been a twin brother of his coat, & born with it somewhere about the plague year, or the Fire of London. He & the Horse from Sardinia, seem to have the most humour of any of y^e company. As to myself, I shall leave that to some more able historian to give it you."

We are next introduced to the future associate and betrayer of Wilkes, or political "Jemmy Twitcher."

"Turin: Jan. 20, 1740.

"We expect Lord Sandwich every day. Lord Sandwich is one that I had an offer of travelling with; but as I was not in a travelling humour, I excused myself as civilly as I cou'd. 'Twas well I did, for if I had went with him, what frights from time to time must you have been in? I don't mean anything rude against his L^dship; for he is a very agreeable, sensible, worthy man. But the spirit of travelling grew so strong upon him that he was not contented with Italy; and when at Naples (which you know is the end of my travels), he hired a ship, and went with my old friend Mr. Finlick, who is his Governour, to Constantinople. He returned thence to Italy, but his eagerness of seeing distant realms wou'd not let him rest there. He hir'd another ship and went to the Holy Land; travel'd all over that & Egypt, where they were when the war broke out between us & Spain. By good luck, at Alexandria they met with an English man of war, with which they set out for Italy, & arriv'd safe off Leghorn, the 23^d of last month. As they come from the East, which is generally infested with the plague, they are oblig'd to perform Quarantine in an Island near Leghorn; and as soon as that is over, they are to set out for this place, to stay here some time. Their company must be agreeable enough to us that have never, and probably never shall see the places they have been at, for besides what I have mention'd, they have been at Troy, & all over Greece."

"Feb. 17, 1740.

"By what good luck, or by what impertinence of my own, I won't determine, but by one or the other, I had much the largest share of his Lordship's company of any body here: and am rather better acquainted with him than I was even with Stephen Duck [the thrasher poet] the three first days he was at Winchester.

"As my good L^d may be the subject of two or three of my letters to you, 'tis fit I should let you know in the first place who he is. He is the great-grandson of the witty Earl of Rochester, whom you must have

remember'd in Charles the Second's time, and whose works are read with so much pleasure by several of the young ladies at Winchester, & all over England. He was bred up at Eaton, with L^d Lincoln, & had the character there of being the finest scholar in that great school. He set out for his travels about four years ago, &c."

From Rome, Jan. 13, 1741, we learn that Spence went to the opera and sat

"in the very Box under the Pretender's. He was there last night with his second son (the eldest was gone out on a Party of Hunting) & some other Blew & Green Garters; for Red, you know, they have none. The Pretender looks sensibly old since I was here last; he read his Opera-Book with Spectacles; his son sat by him in front; y^e Duke de St Anian behind."

BOSTON LETTER.

Boston: Jan. 27, 1875.

Very few new books have appeared since the holidays. The old year went out in a glitter of gift-books, and since then publishers' lists have been very empty. *A Rebel's Recollections*, by Mr. Geo. Cary Eggleston, is, however, a recent book which ought to find readers in England as well as in this country. The author recounts in an agreeable way his own experiences in our late war; he has not written a history of the different campaigns in which he took part, but a mere impersonal account, free from political discussion, of the feeling with which the Southerners, and more especially the Virginians, entered upon the war. With considerable humour he describes the extravagances of the demagogues, the rawness of the untrained troops, the blind folly of the Richmond Government, and the financial madness which our present legislators seem anxious to imitate. It is all light reading such as was suitable for magazine articles, the form in which these sketches first appeared; but the book has some political and historical value, for the author states what came under his own observation. His testimony with regard to some of the Southern leaders is interesting because, as some one has said, it seemed to us in the North as if all the mistakes had happened on our side.

Mr. Bret Harte's *Echoes of the Foot-Hills* is a collection of poems that had already appeared in different magazines. Our old friends, the virtuous drunkard, the moral gambler, and the epigrammatic victim of the sudden and speedily fatal accident, are all there, but the novelty, which made him at first so successful, is wanting. There are also some poems on subjects outside his usual, rather narrow, list, some non-dialect poems, as they are called, a branch of literature in which he has many more successful rivals. On the whole, this volume will add but little to Mr. Harte's fame.

A publication which might be of interest to some of your readers is the *Architectural Sketch Book*, of which a number comes out every month. It is edited by the members of the Portfolio Club, an association of the architects of this city, who take such drawings of the members as it may seem desirable to make public, and have them reproduced by the heliotype process and published, to the number of four or more every month, with some brief explanatory letterpress. It is now eighteen months that this plan has been in operation, and the collected numbers bear witness to a great deal of interesting work. The fire of little more than two years ago naturally made a great deal of rebuilding necessary, and there are drawings of some of the large warehouses which have replaced those then destroyed. Beside these, there are some interesting designs of churches. Perhaps the most striking is the interior perspective and section of the new Trinity Church, which, in another part of the city, succeeds the one burned in November 1872. There are others, too, that may be examined with interest. There is a view of the Museum of Fine Arts, now rising in this city, which will be a noticeable building. There is also a large number of sketches of

country-houses, for the most part built of wood, of town-halls, railway-stations, and of some of the unaccountably large buildings required by Insurance Companies. On the whole, a commendable show is made, and very fair examples are given of some of the good work that has recently been done in this city. In no part of the world has what may be called "the master-workman fallacy" held firmer sway than in this country, and consequently, so far as architecture is concerned, we have been for the most part in the dark ages. Gradually the public taste is rising to the ability to distinguish between work done as it were by machinery and what is really good, and the credit is mainly due to the new and more serious efforts of our architects. In the number for this month there are drawings of some of the work of our grandfathers who did not study in London and Paris—namely, two spires which their descendants grow fond of by association, and praise in tacit comparison with absolute ugliness. I see no reason why the *Sketch Book* should not be of interest to architects in England as well as here. Teachers of architecture will find some of the work done by students of the Institute of Technology as a part of their examination for a degree. Local pride should not forbid my mentioning the *New York Sketch Book*, a similar publication, more recently founded. Perhaps it is provincialism, but I prefer the one of which I have spoken more at length.

You will have noticed that the missing head of the St. Anthony from the Seville Cathedral turned up in New York, and is now on its way back to Spain. It is almost to be wished that it might have been put on exhibition with the other Spanish pictures here before it was returned to its frame, where it is darkened by frequent incense. Another bit of art news which I pluck from the newspapers and communicate "with all reserves" is the discovery of a missing Raphael in Worcester, in this State. Perhaps the arms of the Venus of Milo will yet be found in excavating the Boston Common.

A few days ago died, in his eighty-fifth year, Mr. Charles Sprague, who wrote verses of some merit, which acquired for him, in those days when every American writer was classified by coupling him with some famous Englishman, the title of the American Pope. It was perhaps rather lack of rivals than any positive excellence which made him known. None of the poems he wrote, however, are without some merit.

At a recent meeting of the Boston Society of Natural History, an interesting paper was read by Mr. F. W. Putnam, of the Peabody Academy of Science at Salem, who, by the way, has just been appointed Curator of the Peabody Museum of American Archaeology and Ethnology, a position made vacant by the death of Professor Jeffries Wyman. During the summer months of last year Mr. Putnam was investigating Indian remains in Indiana and Kentucky. In the first-named state he explored two of the many ancient fortifications to be found in the Ohio valley. Most of these are earthworks; others, however, are built of large walls of stone. In one of the forts the main wall was several hundred feet long and nearly ten feet high, with a wall about seventy-five feet high at one place where there was a gap in a steep declivity. The stones were laid without cement or mortar. Near Lexington, Indiana, is a large circle four hundred feet in diameter, consisting of a ridge about four feet wide, formed of fragments of pottery, broken bones of deer and other animals. It would seem that this is the place of an ancient camp or village, for which this mound was built as a palisade. It is to be thoroughly examined next summer.

In Salt Cave, near the Mammoth Cave in Kentucky, some most interesting relics were discovered. The cave is difficult of access, but the explorer was repaid for his trouble. In many places pieces of rock had fallen from the roof of the cave, in others there are nearly level spots with traces of the fires once kindled there, and

small piles of stones, some built in such a way as to serve for fire-places. By the side of these were bundles of faggots, which may have been intended for firewood, or, possibly, for torches. In some side-passages were discovered footprints, with the impression of a sort of half-sandal, and, not far from these, some cast-off sandals, made of rush leaves, braided like the straw sandals of China, but of a different shape. A piece of cloth was also found there; it was more than a foot square, and regularly and delicately woven, probably from the bark of some tree. This cloth had been dyed with black stripes, and darned in one corner. Beside these things, there were found in this cave branches of the same bark as that of which this cloth was made, a number of pieces of bark, twine, and rope with knots where they had been tied together, arrow-points, &c. Now that such important and tempting discoveries have been made, the explorations will be continued. These things just mentioned have been compared with those found with the mummy discovered some sixty years ago near the Mammoth Cave, and it is plain that they are similar in material, design, and structure. Mr. Putnam considered it highly probable that they all belonged to one race, and that the most nearly civilised of the prehistoric inhabitants of America. This valuable paper will be published in full in the *Proceedings of the Boston Natural History Society*.

I have forborne mentioning the lead and silver mine discovered recently in Newburyport, in this State, not because it was not worthy of comment that a valuable metal should be found in Massachusetts, whence it used to be said that only granite and ice could be exported, but from a natural aversion of respectable Americans to saying anything whatsoever about mines to the English public.

Mr. Henry James's *A Passionate Pilgrim, and other Tales* came out last Saturday. The volume contains six stories, which are very good specimens of his skill, and that is of a sort by no means common in writers of English. No one who cares only for the American who talks through his nose, and then addresses his interlocutor by the peculiarly English term "stranger," should open this book. It does not contain a single allusion to the size of this country, nor yet to its flag. The prairie is no more referred to than is the Desert of Sahara. Most of the characters are Americans of education who have travelled in Europe, and who are fonder of picture-galleries than of political meetings: they are in fact civilised human beings.

What is noticeable in all these stories is the carefulness of their construction, and the admirable and artistic way in which they are written. It may seem at first like exaggerated praise, but I think it would be hard to find a writer of English who puts more care, and to better purpose, into his work than does Mr. James. He follows in this respect French rather than English models, and in consequence what he does is attractive in itself. One does not have to look far for examples: perhaps this extract from the first story may serve as well as another. It gives expression to what will possibly not be easy of comprehension to Englishmen—the way in which their country is regarded by those to whom it is a foreign land.

"We possess in America the infinite beauty of the blue; England possesses the splendour of combined and animated clouds. Over against us, from our station on the hills, we saw them piled and dissolved, compacted and shifted, blotting the azure with sullen rain-spots, stretching, breeze-fretted, into dappled fields of gray, bursting into a storm of light or melting into a drizzle of silver. We made our way along the rounded summits of these well-grazed heights—mild, breezy, inland downs—and descended through long-drawn slopes of fields, green to cottage doors, to where a rural village beckoned us from its seat among the meadows. Close beside it, I admit, the railway shoots fiercely from its tunnel in the hills; and yet there broods upon this charming hamlet an old-time quietude and privacy, which seems to make it a viola-

tion of confidence to tell its name so far away. We struck through a narrow lane, a green lane, dim with its height of hedges; it led us to a superb old farmhouse, now jostled by the multiplied lanes and roads which have curtailed its ancient appanage. It stands in stubborn picturesqueness, at the receipt of sad-eyed contemplation and the sufferance of 'sketches.' I doubt whether out of Nuremberg—or Pompeii! you may find so forcible an image of the domiciliary genius of the past. It is cruelly complete; its banded beams and joists, beneath the burden of its gables, seem to ache and groan with memories and regrets. The short, low windows, where lead and glass combine in equal proportions and hint to the wondering stranger of the mediaeval gloom within, still prefer their darksome office to the grace of modern day. Such an old house fills an American with an indefinable feeling of disrespect. . . . Passing out upon the high-road, we come to the common browsing-patch, the 'village green' of the tales of our youth. Nothing was wanting. . . . We greeted these things as children greet the loved pictures in a story-book, lost and mourned and found again."

"Eugene Pickering" is a clever study of character, the character being that of a somewhat battered flirt who is fond of breaking young men's hearts, or trying to. The young man in question is a youth who would have tempted even the veiled nun. "A Romance of Certain Old Clothes" is possibly the best of them all; it is very good, very simple and effective. None of the book is dull, it is all clever and very readable.

THOMAS SERGEANT PERRY.

THE LEYDEN TERCENTENARY FESTIVAL.

THIS remarkable festival was celebrated with great splendour, on Sunday the 7th inst., and the following days. The ancient and renowned university of Leyden had formally invited representatives from all her sisters in Europe to be present, and some seventy learned men, hailing from thirty-three different seats of learning, assembled to witness the celebration. Among them were numbered Madvig, Ernest Renan, Nöldeke, Kuno Fischer, Milne Edwards, Donders, Jhering, Nippold, G. Perrot, and many others perhaps as able, if not so famous. Mr. Mayor came from Cambridge; Messrs. Mahaffy and Atkinson from Dublin; Mr. Heywood from London; in fact, from all the great seats of learning, however remote, even from Clausenburg and Coimbra, deputies were present, with one striking exception. Oxford had sent no representative. Still worse, Oxford had not even answered the formal and stately invitation of the Senate of Leyden.

The Leyden Professors, who "live sumptuously every day," opened their houses, and all the foreigners were entertained with princely hospitality. Evening receptions were given by the Burgomaster, by the curators of the University, and (in the form of operas and concerts) by the citizens. The King and Queen of Holland received the deputies at an afternoon entertainment. Prince Frederick gave them a splendid banquet at his palace, the "Huis de Paauw," near the town. But perhaps most characteristic of all were the entertainments given by the students, which began when everything else was over for the day, and which almost kept up the continuity of pleasure into the next morning. At these most interesting conversaziones there seemed to be a contest whether the variety of wines offered by the host should exceed the variety of languages in which the guests responded. There were speeches made in five languages, viz., Latin, Dutch, French, English, and German, both by the students and to the students; and it may safely be said that there is no other university in Europe where such a thing could have been done. As Professor de Vries cleverly put it, it was a "diversitas linguarum non Babylonica, sed vere Academica."

Apart from social gatherings there were three solemn meetings for strictly academical purposes: two in the Church of St. Peter, to hear the ora-

tion of the outgoing rector, Professor Heynsius; and the oration of the new rector, Professor Buis, with the solemn conferring of degrees, *honoris causa*; and the third meeting in the senate house, when the foreign universities presented addresses of congratulation to the home University. This latter scene was indeed very striking; for, while all around the walls of this celebrated room were panelled by portraits of the former great men of Leyden, the room itself was crowded with the present learning and genius of all Europe. The state costumes, too, of all the various universities were then worn, and afforded much amusement to the good people of Leyden, who thronged the upper windows when the procession swept out of the senate house to pass into the audience chamber of the king. All the houses were hung with flags and banners; all the lower windows filled with exotic shrubs and flowers, so that but for the icy cold of the weather, no gayer or more splendid scene could well be imagined. The mornings which were not spent in bed, by compulsion of exhausted nature, were occupied in visiting the great men and hearing them talk. For at the public entertainments, so great was the number of speeches made, so perpetual was their flow, that it was difficult to get in a word without being called to order by the reproachful glance of a listening neighbour. Every possible health or toast was proposed; every conceivable object of public interest was made the excuse for a cheer. Even the Leyden jar was made the cause of a solemn speech by a German professor, who in his praises of "die Leidene Flasche," did not perceive that a forest of bottles on the table gave a new point to his eloquence. But notwithstanding all these attractions and distractions, any thoughtful observer must have found the highest interest in the hosts, in the great professors of Leyden itself, in its museums and collections, and in the life and character of its students. It was of course impossible to make acquaintance with even a fraction of the great men, and yet the specimens one did meet made one long for a quieter time and a greater intimacy with them. Above all, every visitor was fascinated with the brilliant and vigorous Cobet, the glory of the classical school of Leyden, the real successor of Porson and Bentley, the greatest Hellenist, and if not the greatest Latinist, certainly the best Latin speaker in Europe. As his eminent colleague, Professor Dozy, humorously said to the students, in apologising for speaking in French, "Il ne reste que deux hommes en Europe qui parlent le Latin, ce sont le Pape et M. Cobet." Professor Dozy also, who has turned his knowledge of Arabic so well to account in writing his great history of the Moors in Spain, was a great favourite. Then there was the physiologist Heynsius, whose vigorous attack on theology in his *Festrede*, somewhat reminded one of Tyndall; the jurist Buis, whose address was full of subtle irony and delicate humour, the theologians Scholten and Kuenen, celebrated for their bold and critical treatment of our religious documents—all these men were to be seen and talked with daily, and even sacrificing themselves to showing the visitors through libraries and museums and laboratories. One word in conclusion about the students. The first glance at them was sufficient to separate them totally from the German students, in style and manner, and to show their likeness to the young men at the British Universities. They seemed to be young men of private means, and their lodgings through the town were furnished and kept with an elegance quite equal to that of the lodgings of Cambridge students. There were good prints and pictures on the walls, comfortable arm-chairs and study-tables in the rooms; excellent wine (generally port) on the sideboards. Their conduct as stewards in arranging all the large receptions exceeded all praise. They are now nearly 800 in number, and most of them study law, but rather as a gentlemanly profession than as a means of

subsistence. Their culture in modern languages was vastly beyond that of our Universities; their learning was certainly not inferior to ours. The whole feast was thus one which it will be almost impossible to rival, at least in our time.

CORRESPONDENCE.

THE LATE DR. ROWLAND WILLIAMS.

Liverpool: February 8, 1875.

Much has been written lately on the subject of reviewing. There is one point which I do not remember having seen touched upon; it has been forcibly brought before me, and I desire to call the attention of others to it. I refer to reviews of biographies, and the injury which may be done to the memory of the dead by the imputation to them of motives for their actions which, however false, they cannot repudiate.

Certainly, in writing of those who can no longer answer for themselves, great care should be used with regard to this, and it would seem that only upon two grounds would a reviewer be justified in assigning motives. Either he should have enjoyed a very close and intimate acquaintance with the inner mind of the person of whom he writes, or he should have satisfied himself, and be able to afford proof to others, that these motives may be clearly traced in the man's writings.

In the review of Dr. Rowland Williams' *Life and Letters* in the ACADEMY of February 6, I notice, that motives are assigned as having influenced him in writing his Bunsen Essay, which would have been utterly repugnant to his feelings, and which are in complete opposition to the principles by which he was actuated.

Now, I submit, that Mr. Essington, the writer of the review, though a schoolfellow and friend of College days, hardly possesses the first of the qualifications mentioned above—that of intimate acquaintance—which would justify him in making these assertions; for while no doubt he and Dr.

Williams entertained much kindly regard for each other, in connexion with the memories of Eton and King's, they had, after a visit of Mr. Essington to Lampeter in the early days of the Lampeter life, but little intercourse of late years. An accidental meeting leading to an afternoon call, one summer's day at Barmouth, and a day spent with Mr. Essington at his vicarage, after the first Birmingham League meeting in the autumn of 1869, would, I believe, sum it up.

That Mr. Essington has not availed himself of Dr. Williams' own words in order to acquire an insight into his motives (for I cannot suppose, had he done so, that he would thus ignore them), will, I think, be clear to any one who will take the trouble of reading Rowland Williams' *Life and Letters*, more especially that part which refers to the *Essays and Reviews* prosecution in vol. ii.

In passing, I would remark that Mr. Essington is not very particular about dates, when he refers to intercourse with the Wiltshire clergy (who will doubtless feel much complimented by his manner of describing them), as having influenced Rowland Williams in writing his essay. In the first place, however, saddened he may have been by the line of action adopted by his clerical brethren, no feeling of impatience was manifested by him in respect to the Wiltshire clergy. But this is hardly to the purpose; his acquaintance with them had simply nothing to do with the matter, as his Essay was written before he was instituted to the living of Broadchalke.

It is true enough that mere inane acquiescence did try his patience; but even then, a characteristic story of undergraduate days hardly affords a fair illustration of the deep mental struggle involved in the controversies of some twenty years later. Neither does it seem much to the point, as at this time it was not with inane acquiescences, but with violent objectors, that he had to deal. His object also was, not to involve all in ruin by landing them in the ditch, but rather—to change the simile—by lending a hand in steering the vessel of which he was an appointed officer, he hoped to keep her from foundering on the rocks. See an account of the design of his Essay, *Life and Letters*, vol. ii. p. 25.

Mr. Essington seems to take no account of the real issues at stake in connexion with the *Essays and Reviews* when he describes the appeal to the Privy Council as a pleading for a "petty vicarage." But both appellants remonstrated against a hearing which would have restricted them to pleading against penalty, and in the importance of the questions argued the "petty vicarage" was well nigh forgotten. (Vol. ii. pp. 141, 142, 166, 167.)

That in his defence Rowland Williams adopted a "policy of evasion," and availed himself of "loopholes and backdoors," is simply untrue. In his "Hints to my Counsel in the Court of Arches," he wrote:—

"No legal subterfuge must here prejudice the truth," &c. (*Life and Letters*, vol. ii. pp. 53, 54.)

His determination to conduct his own Appeal to the Privy Council arose from his desire of saying exactly what he did mean, and disclaiming what he did not mean:—

"My opening instruction to my counsel in the Court of Arches was, to employ no technical subterfuge; but to prove that my teaching was duly mindful of my obligation as a clergyman. My disinclination to let the case be won upon principles at variance with those obligations, and with my own antecedents and convictions, was my reason for taking the case into my own hands," &c. (Vol. ii. pp. 138, 331.)

In his concluding address before the Privy Council he said:—

"Nor would I leave without protest the insinuation of the other side that I have asked your Lordships to receive from me any explanation of my essay which is not established and confirmed, when attention is once called to it, by the strictest construction of the language of the essay itself. Two things, my Lords, would cause

me equal pain—if I were, either from any of the accidents to which human affairs are liable to fail of obtaining the redress which I confidently expect from your Lordships' equity, or if I were even in appearance to win such redress by any unworthy subterfuge."

If a man's motives are not to be gathered from his own account of them, would it not—I venture to suggest—be fairer not to assign any motives at all?

I think the niche in the Temple of Fame which Mr. Essington (with doubtless the best intentions) has prepared, is unworthy of one whose ruling principle in life was love of truth. It is certainly a place which Rowland Williams, as an honest man, and in the consciousness of his own integrity, would have protested against having assigned him.

ELLEN WILLIAMS.

THE ORIGINAL OF SHAKSPEARE'S "OTHELLO."

Stoke Newington.

While feeling much indebted, in common, I am sure, with all the readers of the ACADEMY, to Mr. Rawdon Brown for his very interesting letter on the "Original of Shakspeare's *Othello*," I cannot see that that gentleman has established the Moor's historical identity quite so satisfactorily as he supposes.

Let us take what we may call the "historical setting" of Cinthio's novel, as well as that of Shakspeare's play, and compare them with the historical facts which Mr. Brown has collected.

First, then, for the novel. A valiant Moor, tried in the service of the Republic of Venice, and married to a Venetian lady of extraordinary beauty, is commander of the forces stationed at Cyprus, having been appointed to that office by the Senate in the ordinary course, to relieve his predecessor. The Moor murders his wife; whereupon the Senate, being apprised of the fact, orders him to be arrested, and sent home to Venice; upon his arrival, after public trial and torture, he is banished, and is eventually assassinated at the instigation of the relations of his murdered wife.

Now, let us turn to the play. Here we find the Moor appointed to his command in Cyprus under pressure of a particular crisis which is minutely described. A Turkish fleet, variously estimated at 107, 140, and 200 galleys, is sailing towards Cyprus. Such is the intelligence which startles Venice. Then a messenger arrives with tidings that the fleet has changed its course, and is making for Rhodes. Another brief interval, and the Senate is informed that, after having been joined at Rhodes by an additional force of thirty ships, the Turkish fleet is again in full sail for Cyprus. In this imminent danger, the eyes of all men are bent upon Othello as the destined saviour of the Republic; and the Senate, alarm overpowering the natural feeling of resentment against the Moor who has just presumed clandestinely to wed a noble daughter of Venice, confirms the popular choice. The Turkish fleet is shattered by a tempest, and so Cyprus is saved. The Moor murders his wife, is superseded by his lieutenant, and dies by his own hand.

So much for the novel and the play: now let us see what are the historical facts which Mr. Brown has discovered. It appears that in the year 1505 a certain Christofal Moro was elected lord-lieutenant of Cyprus; that he remained in the island after his term of office had expired, and was elected by the then lord-lieutenant and his counsellors commander of the forces against a rumoured attack from some quarter or other; and that in October, 1508, he arrived in Venice, in mourning for his wife, who had died on her way from Cyprus.

At the outset, I must remark that Mr. Brown is altogether mistaken when he asserts that "it has not been noticed that there are circumstances in the play which are not to be found in the novel." If Mr. Brown will refer to a couple of small volumes entitled "*Shakspeare Illustrated*," by the Author of the *Female Quixote*, published more than a century ago (1753), he will find a

very able and interesting comparison of Cinthio's novel and Shakspeare's play.

It may be well to state clearly what I conceive Mr. Brown's theory to be. It seems to involve two distinct propositions:—

1. That the Moor of Cinthio's novel is the historical Christofal Moro, who was lord-lieutenant of Cyprus in 1505, *disguised*.

2. That Shakspeare became aware of this identity, and having ascertained the true story of the historical Moro, drew upon that, as well as upon the novel, in the construction of his play.

Although I am not aware that there is any good reason for supposing that Cinthio's novel was founded upon fact, yet, assuming that it was so, the first of these two propositions is at any rate a very plausible and ingenious conjecture. The name "Moro" might very naturally suggest to Cinthio the desire of disguising his hero as a Moor—a device which would save the author from unpleasant consequences, while the disguise would be too flimsy to prevent the identification of the man by those acquainted with the facts. It does not, however, fall within my purpose to discuss the former of the two propositions; and, therefore, assuming it to be true, I pass on to the second, which certainly stands upon a very different footing.

Every one who has hitherto noticed Shakspeare's divergences from the novel, except Mr. Brown, has referred them to the exigencies of dramatic composition, or to the creative genius of the Dramatist. Certainly, for my own part, I cannot discover a single particular wherein the play differs from the novel, which seems to suggest an acquaintance with the historical facts—and I must say they are very meagre—unearthed by Mr. Brown. Let me take *seriatim* the points of resemblance which he adduces.

First: He thinks that he has discovered in the "strawberries" upon Desdemona's handkerchief, the "three mulberries sable," which with "three bends azure on a field argent" constituted (so we are told) the insignia of another Christofal Moro, who was Doge of Venice in 1460. Did it never occur to Mr. Brown that by making the assumption that the "strawberries" were Othello's insignia at all, we should be involving Shakspeare in a gross inconsistency? for, of course, in that case, Cassio, when he found the handkerchief dropped in his bed-chamber, could not have been in doubt respecting its ownership: he would have recognised it at once as the property of Desdemona. In the novel, Cassio actually does recognise the handkerchief as Desdemona's, but he recognises it not by any insignia upon it, but by the curious inwrought "Moresco work." After this ingenious discovery, I am almost surprised that Mr. Brown has not pointed out that in Iago's simile, "as luscious as locusts," there is a most unmistakable allusion, by way of local colouring, to the noxious insects respecting which we hear so much in Mr. Brown's letter.

Secondly: We are told that it is a "curious coincidence" that the tenor of the official advices from Cyprus, in which the then lord-lieutenant announces the election of Moro as captain of the ships, "corresponds precisely" with the causes assigned in act i. sc. 3 of Shakspeare's play for the despatch of Othello from Venice to defend the island. As the "official advices" are not before us, it is impossible to institute a comparison between them and act i. sc. 3 of *Othello*.

I will only remark that the correspondence which Mr. Brown styles "precise," might appear to another mind very far indeed from "precise," and, further, that, inasmuch as the only specific causes assigned for the despatch of Othello are such as are most obviously applicable to such an occasion, viz., his knowledge of the place, and his great reputation, the coincidence would not be particularly striking, if the Lord Lieutenant of Cyprus alleged similar reasons for the election of Moro upon a similar occasion.

Thirdly: We are told that "Moro's military

exploits in the Romagna against Caesar Borgia, and subsequently during the League of Cambrai, would warrant his saying of himself, 'I have done the State some service, and they know it.' No doubt; but if Shakspeare was acquainted with these services of the historical Moro, why does he prefer to mention Rhodes, Cyprus, and Aleppo as the scenes of the exploits of his Othello? He, at least, could not have been influenced by a fear of offending Moro's kinsmen, if he had given the real facts.

But the most conclusive argument against Mr. Brown's theory appears to be the following. Mr. Brown does not seem to be aware that Shakspeare has laid the events of *Othello* at a period more than sixty years subsequent to Christofal Moro being lord-lieutenant of Cyprus. Reed pointed this out years and years ago. The only attempt, historically recorded, which the Turks ever made upon Cyprus, after that island came into the possession of Venice, was in 1570. This would in itself be sufficient to fix the time; but Shakspeare has in many particulars followed the actual facts. That the Turkish fleet first came sailing towards Cyprus, then went to Rhodes, there met another squadron, and then resumed its way to Cyprus, are matters of history; and Shakspeare is accurate even in the number of the fleet, which (Knolles tells us) consisted of 200 galleys. In the event, indeed, Shakspeare has departed from historical accuracy; for the Turks, far from being overwhelmed by a tempest, succeeded in wresting Cyprus from the Venetians. In this particular divergence from history, however, we see that Shakspeare was guided by the exigencies of his plot. If, then, Mr. Brown asserts that the attempt of 1570 was not the only attempt made upon Cyprus by the Turks, after the island became a Venetian dependency, the *onus* of proof lies upon him; and even if he should succeed in establishing this fact, his labours will then only have commenced; for then it will be incumbent upon him to show that the attempt to which he refers was in its details almost identical with that of 1570. Until this has been satisfactorily proved, I for one shall continue to maintain Reed's confident—but, as I think, justly confident—opinion respecting the time of the play. EDWARD H. PICKERSGILL.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will send their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Feb. 20,	3 p.m.	Royal Institution: Mr. J. T. Wood, III.
	"	Crystal Palace Concert (Middle Krebe).
	"	Popular Concert, St. James's Hall (Halle, Joachim).
MONDAY, Feb. 22,	5 p.m.	London Institution: Dr. Carpenter on "Animal Life of the Deep Sea."
	7 p.m.	Actuaries.
	8 p.m.	Social Science Association. Medical.
	"	Monday Popular Concert, St. James's Hall (Joachim, Dannreuther).
	8.30 p.m.	Geographical.
TUESDAY, Feb. 23,	3 p.m.	Royal Institution: Mr. A. H. Garrod on "Animal Locomotion."
	8 p.m.	Anthropological Institute; Lieutenant C. C. de Crespigny on "The Milanowa of Borneo;" "History of the Henng-Noo," Part II.
	"	Civil Engineers.
	8 p.m.	Royal Albert Hall Concert (Eljah).
	8.30 p.m.	Royal Medical and Chirurgical.
WEDNESDAY, Feb. 24,	8 p.m.	Society of Arts. Geological. Archaeological Association.
	"	Royal Society of Literature: Mr. G. Washington Moon on "Popular Errors in English."
THURSDAY, Feb. 25,	1 p.m.	Sale at Christie's of the Works, &c., of the late John Lucas.
	3 p.m.	Royal Institution: Professor Tyndall on "Electricity."
	6 p.m.	Philosophical Club.

THURSDAY, Feb. 25,	7 p.m.	London Institution: Dr. Richardson on "The Physiology of Sleep."
	8 p.m.	Inventors' Institute.
	8.30 p.m.	Royal. Antiquaries.
	"	Mr. Walter Bache's Concert, St. James's Hall.
FRIDAY, Feb. 26,	1 p.m.	Sale at Christie's of the Works of the late J. C. Schetky.
	7.30 p.m.	Sacred Harmonic Society, Exeter Hall (St. John the Baptist).
	8 p.m.	Quekett Club: Mr. B. T. Lowne on "The Histology of the Eye."
	8.30 p.m.	Clinical.
	9 p.m.	Royal Institution: Mr. W. R. S. Ralston on "Popular Tales; their Origin and Meaning."

SCIENCE.

THE HORSE AND ITS RIBS.

Mémoire sur les Chevaux à trente-quatre côtes des Aryas de l'Epoque Védique. Par C. A. Piétrement, Vétérinaire en 1^{er} au 5^e Régiment d'Artillerie. (Paris: E. Donnaud.)

SYLVIVUS said that man had formerly an intermaxillary bone. If he has it no longer, he ought to have it. In this he was right. The same Sylvius, in his answer to Vesalius, said that Galen was not wrong when he described man as having seven bones in his sternum, for, said he, "in ancient times the robust chests of heroes might very well have had more bones than our degenerate day can boast." In this he was wrong.

I take these statements from Mr. Lewes' *Life of Goethe* (p. 343), and I have to confess that I have not verified them. They interested me, however, as bearing on a controversy that has been carried on for some time between scholars and anatomists, viz., whether another animal, the horse, instead of losing, has developed in course of time some bones which it did not originally possess. Horses have now thirty-six ribs, sometimes, it is said, thirty-eight. But there is a passage in the Rig Veda which speaks apparently of only thirty-four ribs in horses. It was M. Piétrement who in his work *Les Origines du Cheval domestique d'après la Paléontologie, la Zoologie, l'Histoire et la Philologie* (Paris, 1870), first called attention to this curious statement, and drew from it the conclusion, supported by some very ingenious arguments, that at the time of the Vedic poets, say about 1500 B.C., there existed a race of horses with only thirty-four ribs. Other zoologists, and more particularly M. Sanson, raised some strong objections, but M. Piétrement replied to them in his *Mémoire sur les Chevaux à trente-quatre côtes des Aryas de l'Epoque Védique* (Paris, 1871), and the question is still *sub judice*.

M. Piétrement's reasoning may best be given in his own words:—

"Je ferai d'abord remarquer que la présence de trente-quatre côtes seulement, sur une race équestre, soit ancienne soit actuelle, ne serait nullement un fait anormal, en dehors des lois de la nature; car il est parfaitement reconnu aujourd'hui que le nombre de ces pièces osseuses est loin d'être constant sur nos chevaux actuels. M. Chauveau s'exprime en effet ainsi à propos du nombre de côtes des chevaux: 'On compte pour chacun des moitiés latérales du thorax, dix-huit côtes. Il n'est pas rare d'en rencontrer dix-neuf, avec un nombre égal de vertèbres dorsales, chez les chevaux bien constitués, mais alors il n'existe, le plus souvent, que cinq vertèbres lombaires.'

"D'autre part, on rencontre quelquefois, chez des sujets d'un certain type, 'cinq vertèbres lombaires seulement, au lieu de six qui est le nombre

habituel sur l'espèce *Equus caballus*, avec le nombre des autres pièces du rachis.'

"Lorsque ce dernier fait fut annoncé en France par M. Sanson, il rencontra beaucoup d'incrédulités; mais il est aujourd'hui complètement acquis à la science; et il est à juste titre considéré comme l'indice de l'ancienne existence d'une race de chevaux à cinq vertèbres lombaires; chevaux dont le croisement avec ceux à six vertèbres lombaires rend d'ailleurs parfaitement compte des fréquentes anomalies de conformation que l'on rencontre dans cette région du rachis."

Having by these considerations established the possibility of an ancient race of horses with only thirty-four ribs, M. Piétrement appealed for its reality to a passage in the most ancient literary document of the whole Aryan world, the Rig-Veda.

The passage in which the thirty-four ribs of the horse are mentioned occurs in the 162nd hymn of the first book of the Rig-Veda Samhitā. I translated the whole of that hymn in my *History of Ancient Sanskrit Literature*, 1860, p. 553. The hymn is ascribed to Dirghatamas, and describes the sacrifice of the horse in very full detail. In the eighteenth verse we read:—

"The axe approaches the thirty-four ribs of the quick horse, beloved of the gods. Do you wisely keep the limbs whole, find out each joint and strike."

This passage is curious in many respects. It refutes the statement of Strabo (xv. 54), that the Indians did not slaughter their victims, οὐδὲ σφάττουσι τὸ ἱερεῖον, ἀλλὰ πρίγουνσι, ἵνα μὴ λελωβημένοι ἀλλ' ὀλόκληρον δέδωται τῷ Θεῷ. It also seems to imply that the horses then offered at the sacrifices had only thirty-four ribs. This statement, however, startled even the orthodox commentators in India, and Sāyana remarks in his commentary on this passage, that other animals, such as goats, &c., have only twenty-six ribs, as might be proved by what he considers as far more convincing than ocular evidence, viz., a passage from the Brāhmanas, in which it is said, "Its ribs are twenty-six." In another passage, in his commentary on the Satapatha brāhmana, xiii. 5, 1, 18, Sāyana returns to the same subject, but unfortunately that passage, as edited by Professor Weber, is so corrupt, that I at least cannot make sense of it, though it is clear that Sāyana says there that their ribs are thirty-six. Another commentator, Mahidhara, explaining the Horse-sacrifice, as prescribed in the Yagurveda, seems to have no anatomical misgivings, but states that the horse has thirty-four, goats and other animals twenty-six ribs.

I confess that I was myself very much puzzled by the passage in the Rig Veda. It was quite clear that the reading *katustrimsat*, thirty-four, cannot be called in question; it was equally clear that that number would not have been mentioned except for some special purpose. That it was the habit of the ancient Hindus to count the various bones of the human or animal skeleton, may be seen in the Law-book of Yāgnavalkya iii., 85 seq. There we read:—

"The neck consists of fifteen bones, a collar-bone on each side, and the chin; two at its root, and the same on the forehead, the eyes, and the cheeks, and the nose of firm bone. The ribs with their supports and the Arbudas (*Zippenknorpel*) are seventy-two. Two front-bones, four

skull-bones of the head, seventeen bones of the chest, these are the bones of a man."

Similar passages occur elsewhere, and establish the fact that the ancient anatomists of India made a point of knowing the exact number of the bones in the different portions of the bodies both of men and animals.

Not being able to find a satisfactory solution of my difficulty, I applied to Professor Huxley, and I am glad, with his permission, to print the following letter, which offers a most ingenious, and, to my mind, satisfactory solution:—

"26 Abbey Place, N.W.

"My dear Sir,—I have been much interested in M. Piétrement's *Mémoire*. His work *Les Origines des Chevaux Domestiques* is well known to me, but I had paid no particular attention to his incidental mention of the 34-ribbed Aryan horse.

"M. Piétrement's essay raises three questions. The first, Does the passage of Dirghatamas' hymn cited, necessarily imply that the horse known to him had only thirty-four ribs? The second, Does the passage from Sáyana imply, that he asserted of his own knowledge that the horses of his time in 1400 A.D. had only thirty-four ribs? The third, Are there any zoological arguments in favour of or against the existence of a breed of 34-ribbed horses?

"1. Your Latin version of the solitary Vedic passage upon which M. Piétrement relies, admits the reading: 'The axe cuts through [the] thirty-four ribs of the quick horse,' &c.

"I speak ignorantly, but suppose I am right in assuming that there is no more 'the' in the Sanskrit than in the Latin. Nevertheless it is upon the presence of this definite article that the question turns. For, without it, the passage may simply mean that the axe cuts through thirty-four ribs out of the thirty-six with which the horse is provided. What makes me think that this may be the proper signification of the passage is the inquiry I put to myself, For what purpose did the sacrificing priest want to cut through the horse's ribs? Surely, in order to disembowel him. But in order to do this no one would go through the great trouble and labour of chopping through the bony parts of the ribs of a horse. Moreover, such a proceeding would be incompatible with the objection to mangling the horse's bones, which is strongly displayed elsewhere in the Vedic hymn.

"But every bony rib ends below in a gristly substance, and it is quite easy to cut these 'costal cartilages,' and then turning them back, along with the breast-bone, the cavity of the chest is laid widely open, and the priest readily reaches the heart or the like.

"But if every rib ends in a cartilage there must be thirty-six cartilages and not thirty-four?

"True, but the last pair of ribs is much shorter than the others. It is not needful that all the thirty-six pairs of costal cartilages should be cut through in order to lay the chest thoroughly open; and for sacrificial purposes it may have been inconvenient to cut through more than the thirty-four ribs which lie in front of it.

"If you are laying open a man's chest for a *post-mortem* examination, you go to work exactly as I am supposing the Aryan priest to do. You cut through the rib cartilages on each side and take them away, along with the breast-bone to which they are attached. But, in doing this, you leave at least the last two ribs on each side untouched, because they are free, so that it is not needful to cut them.

"If I were a poet, and made a hymn about a *post-mortem* examination, I might speak of the operator's scalpel 'cutting through the twenty ribs,' without meaning to imply that a man of the period is devoid of his full complement.

"2. Does Sáyana say that the horses of his time had only thirty-four ribs? The passage quoted

by you does not seem to me to bear that interpretation at all.

"3. As to the zoological aspect of the question. Horses may undoubtedly vary not only in the number of their ribs, but in the number of their dorso-lumbar vertebrae. The latter may be twenty-four (as usual), or twenty-three, as in the cases cited by Sanson, and also by Legh in his *Handbuch der Anatomie der Haustiere*; and the former may be eighteen (as usual) or nineteen on each side. Unfortunately, I know of no case on record (and M. Piétrement seems to have been unable to find one) in which either horse, ass, or other equine animal had fewer than thirty-eight ribs. If a 34-ribbed race of horses ever existed, I think it ought to turn up as a variety now and then. But it does not; and what is still more to the purpose, we do not find that any of the immediate allies of the horse have fewer than thirty-six ribs; though they may, as in the case of the ass, have only five lumbar vertebrae.

"Without wishing, in the least, to dogmatise then, I must say that the zoological probabilities appear to me to be dead against M. Piétrement's hypothesis; and unless you tell me that the Sanskrit text must mean that Dirghatamas' horses had thirty-four ribs and no more, I shall take leave to doubt the existence of these 34-ribbed steeds.

"I am afraid I have troubled you with a very long letter, which does not come to much in the way of certainty after all. . . .

"I remain,

"Yours very truly,

"T. H. HUXLEY."

I have little doubt that Professor Huxley has solved the riddle. It is open to translate either the thirty-four, or thirty-four ribs; but whether we adopt the one or the other rendering, it seems clear that the poet must have had some reason for mentioning that number. If thirty-four was the usual number of a horse's ribs at his time, then there seems little reason for giving the number. "Cut the ribs" would have conveyed the same meaning as "cut the thirty-four ribs." If, on the contrary, the number thirty-four was mentioned because it was exceptional, then the poet and his commentators too would have said more about the anomaly. Everything becomes intelligible if we admit that in cutting open the horse, two ribs were not to be cut, so that they might remain and keep the carcase together. In that case to mention the number of ribs that were to be cut had a purpose, though it is strange that tradition, which in India possesses such extraordinary tenacity in unimportant matters, should not have preserved the original purport of the words of Dirghatamas. I have looked in vain for a passage where the cutting of the thirty-four ribs in the Horse-sacrifice is more fully described; but I ought to add that in the oldest descriptions of the sacrifice of other animals, preserved in the Aitareya-Brāhmaṇa and the Śrauta-Sūtras of Alvarayana, nothing is said of leaving two ribs undivided. "Twenty-six are his ribs," we read: "let him take them out in order; let him not spoil any limb."

MAX MÜLLER.

SCIENCE NOTES.

ASTRONOMY.

Transit of Venus.—The members of the Egyptian Expedition have returned to this country, bringing with them the photographs of the transit taken at Thebes, which, as was to have been expected from Captain Abney's reputation as a

scientific photographer, leave nothing to be desired as records of the relative positions of the sun and Venus. The scale, twenty feet in length, formerly used by Mr. De La Rue, at Kew, has been erected at Greenwich Observatory, and photographs of it will be taken with the various photo-heliographs, to determine the optical distortion for each instrument. This being duly allowed for, a comparison of the diameters of the sun and Venus on each photograph, with their respective angular values, will give the scale for each plate in terms of which the distance between the centres is to be expressed, the diameter of the sun being increased by photographic irradiation, while that of Venus is diminished, so that the sum of the two is sensibly free from this disturbing cause. By this process the necessity for a temperature correction is entirely obviated, and the photographic measures can be included in the same scheme of reduction as the eye observations (similarly corrected for irradiation where necessary), on the plan proposed by Sir George Airy. This work will be at once commenced, but until the whole mass of observations has been discussed, nothing but harm will be done by incomplete investigations, a point which has been clearly brought out by recent discussions in the French Academy, where M. Le Verrier protested strongly against the publication of the details of observations as they arrived, and their partial discussion by the use of the Method of Least Squares as a mere mill to grind out the solution required. Professor Tacchini writes from Muddapūr, Bengal, that the Italian party under his charge were successful both with the spectroscopic and ordinary observations. The chief points of interest are (1) that last external contact occurred apparently two minutes earlier with the spectroscope than with the ordinary eye observation, indicating that the apparent diameter of the sun with the spectroscope is less than with the ordinary method, which would tend to show (unless the difference be accidental) that there is a shallow layer of luminous gases below the photosphere. (2.) That the spectrum of the atmosphere of Venus shows two dark bands in the red corresponding to two in that of our own atmosphere (near B and C), and indicating the presence of aqueous vapour.

Coggia's Comet.—In the *Memorie della Società degli Spettroscopisti Italiani*, P. Secchi gives an account of his observations of this comet, the points to which he directed special attention being four:—(1.) Is the spectrum of the comet the same at its greatest brilliancy as at its first appearance? (2.) Do the bright bands preserve the same position and intensity? (3.) What influence has the sun's light on it? and (4.) Is it polarized?

The spectrum was compared with that of carbonic oxide and dioxide, and of olefiant gas, and P. Secchi concludes, from the relative brightness of the bands, that the proper light of this comet was probably due, not to a hydrocarbon, but to a compound of carbon with oxygen at the temperature of the Voltaic arc. No change in the position of the bright bands during the whole period of observation was detected, though they, as well as the continuous spectrum of the nucleus, increased enormously in brightness; the latter spectrum was found to be polarised, and therefore due to reflected sunlight. A similar result was obtained by direct observation without the spectroscope, the head being, as in the comet of 1862, strongly polarized; the proportion was about half that of light reflected from oil-cloth at an angle of 45°. Although with a power of 200 there seemed to be a planetary nucleus more than 8" in diameter, this was reduced to less than 0.6" with a power of 600, and P. Secchi concludes that there was no solid nucleus.

The phases of the nucleus and jets of light appear not to have been very well seen at Rome, the rough sketches given not showing anything of the curious appearances observed in this country,

though the strong twilight of northern latitudes interfered much with observations here. Though not much attention was paid to the tail, curious changes in its appearance are recorded, the axis having at first been the brightest part, but afterwards becoming comparatively dark as the tail increased in size, till it attained its greatest length of 60° on July 18, shortly after perihelion passage which occurred on July 9, and before the nearest approach to the earth on July 22. Secchi's observations support those of Heis, according to whom the tail was not directly opposite to the sun, but inclined 23° to the prolongation of the radius vector.

In the same Memoirs are given the outlines of solar prominences assiduously observed in the last six months by P. Secchi and Professor Tacchini, a work for which the climate of Italy is peculiarly suited.

Comets.—Both Encke's and Winnecke's comets have been found close to their predicted places; the latter, an exceedingly faint object, having been seen only at Marseilles. Neither of these comets is likely to be visible to the naked eye, or, indeed, to any but fairly powerful telescopes, and the chief interest attaching to them lies in the circumstance that they are regular visitors; Encke's comet returning at intervals of about 3½ years, and Winnecke's at intervals of rather over 5½ years.

Cape Observations.—The results of the observations made at the Cape of Good Hope in 1859 and 1860, under Sir Thomas Maclear, and reduced by his successor, Mr. Stone, have just been published in the form adopted for previous years, and will prove a welcome addition to the rather scanty observations of southern stars hitherto accessible.

Catalogue of 500 Nebulae.—Dr. Schultz has communicated to the *Monthly Notices* for January a preliminary catalogue of the 500 Nebulae observed by him with the Upsala refractor of thirteen feet focus, the places being determined by micrometrical measures of distances from comparison stars. The positions of these latter are not in all cases known with all the accuracy desirable, and Dr. Schultz considers that the places of some of the nebulae given in this preliminary catalogue may have to be slightly modified on this account, though even in its present state the catalogue is of great value, fairly accurate positions of nebulae having been hitherto very limited in number.

Orbital Movement of 61 Cygni.—In the *Comptes Rendus* M. Flammarion discusses the observations of this double star since 1753, with the view of showing that the two components are not revolving about each other, though from the fact of both stars having a large proper motion of nearly the same amount and direction, he concludes that they are physically connected in some mysterious way. A special interest attaches to this double star, from the circumstance that it was the first of which the distance from the earth was determined, the annual parallax, or apparent radius of the earth's orbit at the distance of the star being about 0'·4, from which it results that the actual interval between the two components (supposing them square to the line of sight) is about thirty-seven times the interval between the earth and sun, the apparent interval being 15". Now, if the apparent path of one star about the other could be found, it would be easy to find the actual dimensions of the orbit, and from that the combined mass of the two stars. Bessel attempted this, and found the mass to be about three times that of our sun; but his data were insufficient, and M. Flammarion now points out that a motion of one star in a straight line relatively to the other would satisfy all the observations. This would be equivalent to a slight difference of proper motion between the two stars; but as we have reason to suppose that no instance of rectilinear motion occurs in nature, M. Flammarion's conclusion that the movement is not orbital, though the two stars are physically connected, will not readily be accepted, considering the errors to which measures of the distance between two stars are liable, though it must be ad-

mitted that there is so far no evidence of deflection from a straight line. The change in angular velocity, however, is the best indication of orbital movement, and this does not seem to have been discussed by M. Flammarion. Meanwhile the fact remains that both these stars are annually carried in the same direction over a space nearly equal to the distance of Uranus from the sun.

Dr. A. M. Ross has published a *Flora of Canada*, which we hasten to explain is simply a badly compiled and badly printed catalogue of the names, Latin and English, of the plants found in the Dominion. Introduced and indigenous species are not discriminated, but this is a mere detail. We should have, however, expected that the compiler would have taken the trouble to correct the list before printing it off and sending it out into the world; but, judging from the small proportion (perhaps half) of the names accurately spelt, we should have expected too much. Botanists may, no doubt, easily guess what is intended by Caperidaceae, Grassulaceae, Orobandaceae, Plantinaceae, &c., yet it is quite inexcusable to print such rubbish even in Canada. The same Doctor prints a list of the Forest-trees of Canada, and refers the ash-tree to the natural order Oleraceae (Oleaceae)! an amusing blunder, if it had stood alone.

FROM a circular received from the Board of Managers, we learn that a botanical establishment is about to be founded at Chicago. It is to comprise a botanic garden proper, provided with suitable houses for the reception of plants requiring protection, an arboretum, a garden for general floriculture, a botanical museum, an herbarium and a botanic library. Contributions of specimens, &c., are solicited, with the expectation of suitable returns being made at an early date. Mr. H. H. Babcock has been appointed director.

THE *Popular Science Review* for January contains an interesting article on Ant-supporting Plants, by Mr. J. Britten. The writer has had no opportunities for original investigation, but as a recapitulation of the facts already known in a succinct and collected form, the present article will be very welcome to many readers. Relatively, little is actually known of the mutual economy of the plants and insects thus strangely associated, and their life-history can only be traced out in the countries where they are at home. Mr. Trail, a naturalist in South America at the present time, is giving the subject some attention, and may be expected to add to our knowledge; but it is not a pleasant task, for the ants, though small creatures, sting most atrociously. Although the fact that certain parts of some plants (always?) provide a habitation for certain insects was known and published so long ago as 1750 (*Herbarium Amboinense*, Rumphius), very little importance was attached to it, and it is only within the last few years that naturalists have taken up the subject in a philosophical spirit. Weddell, *Ann. Sc. Nat.*, sér. 3, t. xiii., 262-67, Schomburgk (*Ann. and Mag. of Nat. Hist.* i. 264), and Belt (*Naturalist in Nicaragua*) have done most to create an interest in these natural phenomena. One plate, and that not a very satisfactory one, illustrates Mr. Britten's paper. It is a pity that the subject is not more fully illustrated, as good figures would have told far more than descriptions. An attractive little book might be made with more complete materials. The parts of plants tenanted by ants vary in different species. The following list includes most of those at present known:—*Leguminosae*, hollow thorns of various species of *Acacia*; *Melastomaceae*, inflated leaf-stalks of numerous species of the genera *Tococa*, *Calophysa*, *Microphysa*, *Myrsinidone*, and *Maieta*; *Rubiaceae*, tubercous root-stocks of the epiphytical genera *Myrmecodia* and *Hydnophytum*, and the leaf-stalks of *Remijia* sp.; *Gentianaceae*, hollow stems of *Tachia guianensis*; *Boraginaceae*, base of leaf-stalks of *Cordia nodosa*; *Verbenaceae*, hollow in-

ternodes of a species of *Clerodendron*; *Polygonaceae*, stems and branches of several species of *Triplaris*; *Artocarpeae*, hollow trunk of *Cecropia peltata*; and finally, the pseudo-bulbs of *Schomburgkia tibicina*, an orchid. With the exception of the Rubiaceous genera *Myrmecodia* and *Hydnophytum*, from the islands of the Indian Archipelago and tropical Australia, all the plants affected, hitherto observed, belong to the New World. Doubtless further research in Africa will lead to the discovery of analogous cases in that country, as several species of *Acacia* with large hollow spines are known to inhabit the tropical regions of both sides of the continent.

THE attention of scholars interested in post-Augustan literature is called to R. Klusmann's *Emendationes Frontonianae* (Berlin: Calvary, 1874). Since the appearance of Naber's excellent edition of Fronto's letters in 1867, little has been done for the explanation or correction of the text: a circumstance which calls for remark, owing to the goodness and carefulness of that edition, and the rare value of the palimpsest. Besides my own paper in the *Journal of Philology* i. 15-20, to which M. Klusmann several times refers in terms most flattering to myself, a short paper by Eussner in the *Rheinisches Museum*, another by M. Klusmann's own father and by Lentsch in the *Philologus*, and a brief note by Bishop Wordsworth, *Journal of Philology* i. 160, to which I may be allowed to add some corrections by the Master of Trinity in his edition of the *Phaedrus*, little has been done to elucidate this most interesting collection. In *Emendationes Frontonianae* M. Klusmann has made a most valuable addition to these materials. The book is indeed indispensable to every student of Fronto, not only on its own merits, though these are very considerable, containing as it does careful lists of Frontonian usages, rare words and forms, &c., as well as many clever corrections; but even more as including a most accurate re-examination of the palimpsest by Studemund, who is well known to spare no labour in the minutest scrutiny of such priceless treasures as these unfortunately fragmentary leaves. How difficult to decipher these sometimes are, was known long ago; M. Rieu's collation, which forms the basis of Naber's edition, settled much; but many passages still remained where the reading was doubtful, in spite of all pains; and where Studemund's scrutiny will be found to differ materially from both him and Mai. Studemund does not, of course, profess to read many passages—indeed, thinks they cannot be read certainly without the help of new chemical applications; but all that can be made out is here given minutely, as well as various often felicitous emendations of his own. They form a worthy pendant to the *Analecta Liviana*. R. ELLIS.

MEETINGS OF SOCIETIES.

PHYSICAL SOCIETY (Saturday, January 30).

PROFESSOR G. CAREY FOSTER, F.R.S., Vice-President, in the Chair. Mr. J. Mostyn Salter was elected a Member of the Society. Mr. Becker described and exhibited an optical bench, constructed by him in accordance with the plans of Professor Clifton, for the purpose of showing the various phenomena of the interference and diffraction of light. Mr. A. Schuster afterwards spoke at some length on "Electrical Theories," criticising the received views with regard to several points, especially the explanations commonly given of the origin of thermo-electricity and its connexion with contact-electricity and the so-called Peltier effect. It was announced that the annual general meeting, for the election of officers and council for the ensuing twelve months, and other business, would be held on Saturday, Feb. 13.

ANTHROPOLOGICAL INSTITUTE (February 9).

COLONEL A. LANE FOX, President, in the Chair. A paper by the Rev. Wentworth Webster, M.A.,

was read, entitled, "The Basque and the Kelt: an examination of a paper by Mr. Boyd Dawkins, F.R.S., on 'The Northern Range of the Basques,' in the *Fortnightly Review* of September, 1874." The author commenced by pointing out the danger of the tendency to extreme specialisation among scientific men of the present day, and proceeded to show how the "Basque problem" had suffered through that special treatment. It had been taken up by pure philologists and pure anthropologists, who had viewed it only from their particular standpoints, and had too much neglected historical and archaeological researches, folk-lore, literature, drama, and, strangest of all, the physical characteristics of the present Basques. The chief object of the author was to show how inconclusive was the evidence of anthropology alone, and to examine Mr. Dawkins's arguments. He considered, firstly, that philology had demonstrated the Basque language to be agglutinative; secondly, that Humboldt's conclusion is correct as to the existence of Basque names in the classical itineraries of Spain; and thirdly, that although the identity of Basque and Iberian cannot be considered to be perfectly demonstrated, the degree of its probability is very high. The special point of dispute was the conclusion of Mr. Boyd Dawkins that "the former presence of an Iberian race in Armorica is demonstrated by Dr. Broca's map of the stature and complexion of the peoples of France." The author at great length examined and analysed the map referred to and the statistics cited in the paper, and found that the evidence from anthropology alone did not seem sufficient to support the theory combated, and all other evidence would appear to be opposed to it. He maintained that the purest Basques were a tall fair people, although lately represented to be short and swarthy.

Professor Boyd Dawkins, F.R.S., expressed his disappointment that the author had brought forward no philological evidence whatever in support of his views. Philology had its value, but it could not be accepted as a test of race. He repelled the charge of the author of the paper as to the inaccuracies of his (Prof. Dawkins's) historical review of the Basque question, and maintained that he was borne out by facts in abundance, some of which he recapitulated. He further gave a general summary of his argument as expounded in the article criticised by Mr. Webster.

Prince L. Lucien Bonaparte thought that the truth lay between the views of the specialists, namely, those of the philologists on the one hand, and ethnologists on the other, for it was a bold theory to advance that language is a test of race, and it was a no less bold opinion that language should be rejected as evidence in the question. There were examples of races which had entirely lost their original language. The Celt of Cornwall was still a Celt in spite of his loss of the ancient language, and there are many pure Basques who know nothing of the Basque language. In Pamplona Basque was spoken less than two hundred years ago, and the change of language there might be taken as the exception that proves the rule. That the majority, however, of the Basque-speaking peoples are not Basques, it would be absurd to suppose; and in such a case, and where the Basque has not been recently introduced, language may be considered as a fair test of race. On the whole it was difficult, the speaker felt, to disagree with the author of the paper. The immense majority of the inhabitants of St. Jean de Luz are Basques physically, and they speak the Basque language with a pure accent. It was not easy to determine whether and why the dark or fair element prevailed among the Basques and among families, too, who for five or six generations retained Basque names. That seemed to involve a contradiction, and to present a problem which he would leave for solution to the anthropologist.

Professor Busk, F.R.S., agreed with Dr. Broca in his determination of a dolichocephalic type of

skulls of the inhabitants of Guipuscoa, and that it is typically Basque. Twenty-one per cent. of French Basque-speaking people are brachycephalic. He remarked on the close similarity, or almost identity, of the Basque area, as depicted by Prince Lucien Bonaparte in his maps and by Dr. Broca in his memoir, determined, as it would appear, upon totally independent data.

Mr. Hyde Clarke vindicated the claims of philology as a branch of anthropology and of natural science. He stated that the Basque area of W. von Humboldt was to be much limited, and that the later Iberian, which was connected with the cultivated Sumerian, was to be distinguished from it. The Basque language had African affinities with the Houssa, &c., and was thus connected with dark populations. The fair people in the Basque countries were descended from Iberian and other refugees.

The Rev. A. H. Sayce, M.A., as a philologist, maintained that language could not be held to be a test of race; it was a test only of social contact. He thought a great part of Mr. Webster's paper was beside the point. The author seemed to think only of the Basque language, and did not appear to look sufficiently at generalities. The agglutinative Basque of the author well represented the opinion of Professor Dawkins. The Basque being the only non-Aryan language of Western Europe, it was evidently the language of a people occupying the country before the inroad of the Celts. Referring to the names of places, he (Mr. Sayce) was of opinion that nothing could be more misleading to a philologist than to rely upon them for guidance in his investigations.

Mr. J. Rhys held that philology could do little towards the solution of the Basque problem. The Basque was a phonetic dialect.

Mr. W. J. Van Eys said that reference having been made to the authority of Humboldt, he would remark that it appeared to him that that great author had not proved the Basques to be Iberian.

Professor Hughes thought that the author had somewhat misapprehended the scope and drift of Professor Dawkins's argument.

Dr. J. Simms also gave his experiences of the physical characteristics of the Basques as he had lately seen them, and testified to the admixture of fair and dark elements noted by Prince Lucien Bonaparte in his remarks. He gave further facts corroborative of Mr. Webster's observations.

GEOLOGICAL SOCIETY (Wednesday, February 10).

J. EVANS, Esq., F.R.S., President, in the Chair. A paper was read "On the Phosphorite Deposits of North Wales," by Mr. D. C. Davies. These deposits are an extension of those discovered in 1863 near Cwmgyen, a few miles from Oswestry, and described by Dr. Voelcker before the British Association at the Birmingham meeting in 1865. The phosphatic bed occurs in the upper part of the Bala limestone, and consists of blackish shales containing irregular nodules, the surface of which is usually coated with a thin lustrous black incrustation of a graphitic mineral. The nodules are richer in phosphate than the surrounding beds, but the average yield of the deposits taken as a whole is about 46 per cent. of tribasic phosphate of lime. The bed may be traced persistently over an area of many miles, and is likely to be of great economic value. The probable origin of the phosphate of lime is a question still open to discussion.

Mr. Rooke Pennington described "The Bone-caves in the neighbourhood of Castleton, Derbyshire." His descriptions applied to several caverns in the Mountain Limestone, which contained deposits of very various ages, some extending to comparatively recent times. The most important of these ossiferous deposits is that at Windy Knoll quarry, where a fissure in the limestone has yielded an interesting collection of mammalian remains, which were described in a paper by Professor Boyd Dawkins "On the Mammalia found

at Windy Knoll." It is not necessary to notice these communications at length, since the discovery of which they chiefly treat has already been noticed in the *ACADEMY* (No. 113, p. 18; No. 131, p. 515).

SOCIETY OF ANTIQUARIES (Thursday, Feb. 11).

A COMMUNICATION was read from Dr. Keller, concerning a bronze statuette of the Gaulish Jupiter, found in the Canton Valais. The god is represented with one hand uplifted, as if in the act of pouring out wine.

A cast was exhibited of a bronze object discovered in Lake Neuchâtel, which has hitherto been a puzzle to antiquaries. Only one other example has been found. The shape of this curious object is, roughly speaking, like that of a pistol; but what represents the stock is not solid, but formed of a bent plate of bronze. The two sides of this plate are connected by a wire, on which three rings are hung. No satisfactory conjecture has been made as to the use to which it could be applied.

A paper by Mr. Westropp was read, showing the almost universal use of the fillet cross as an ornament. It occurs on pottery at Hissarlik, and on Greek coins. In the latter case it probably originated in an attempt to decorate the punch mark, which has a rough resemblance to the fillet. Among the Buddhists it was employed as a symbol of resignation. It occurs also in China and in Central America.

ROYAL SOCIETY (Thursday, February 11).

THE following papers were read: "On the Structure and Development of Myriothela," by Dr. Allman; "Some Particulars of the Transit of Venus across the Sun, December 9, 1814, observed on the Himalaya Mountains, Mussoorie," and "Appendix to Note, dated November, 1873, on White Lines in the Solar Spectrum," by J. B. N. Hennessey.

NEW SHAKSPEARE SOCIETY (Friday, February 12).

F. J. FURNIVALL, Esq., Director, in the Chair. The names of twenty new members were announced, and the Treasurer's cash-account for 1874, as audited by Mr. H. B. Wheatley and Mr. Smart, was read. A sheet of Dr. B. Nicholson's edition of the quarto of *Henry V.*, which is nearly finished, was laid on the table. The papers read were:—1. On the pseudo-Shaksperian Plays of *Mucedorus* and *Faire En*, by Richard Simpson, Esq. 2. On a New Metrical Test for settling the Chronology of Shakspeare's Plays, by Professor J. K. Ingram, LL.D. 3. Notes of German Shakspeare-Literature, by Professor E. Dowden, LL.D. 4. Characteristics of Ben Jonson, by E. H. Pickers-gill, Esq. Mr. Simpson showed that *Mucedorus* had been attributed to Shakspeare on the strength of additions made for a representation at Court some time between 1605 and 1610, when Shakspeare was head of the King's players. He showed that *Faire En* belonged to a series of plays reflecting upon Greene and Peele, all of which were attributed to Shakspeare long before the discovery of the allusion to him in the *Groatsworth of Wit* revealed the antagonism between the men. He showed that Greene had attacked *Faire En* and its author virulently in 1591, and that the play referred to dramatic and literary incidents: that "William the Conqueror" was meant for William Kemp, and "Manville," another of the characters, for Greene. The play belonged to Lord Strange's players, and contained local allusions hardly intelligible out of Lancashire. 2. Professor Ingram's new test was the "speech-ending" one, a development of the unstopt-line test. In early plays, nearly all the speeches end with the end of a line; in the *Two Gentlemen of Verona* 236 speeches do so; while in the late plays very few do; in the *Tempest* only 16. Professor Ingram has found this test hold good for several early and late plays, and he proposes to try all the

plays with it. 3. Professor Dowden first urged on the Society the duty of preparing a Hand-book of Shakspeare Literature, by which a student, even in the wilds of a Godless Irish college, might know what had been written on any play or point he wished to study; and then an Annual Report, like that of the German Shakspeare Society, on all the Shaksperian material of the past year. The Professor then sketched in a pleasing and vivid way the works of German Shakspeare writers which he had lately read: those of Genée, Albert Cohn, Franz Horn, Professor Kobersteen, Lemcke; Ulrici, Karl Elze, and Hertzberg (highly praised); Delius (first and alone in his line), Bodenstedt, Flathe (the smasher of all other critics, the adorer of himself), Hebler, Vischer, Benno Tschischwitz (with his interesting *Hamlet* parallels from Giordano Bruno), Rötcher, Otto Ludwig (with admirable points), Eduard Vehse, H. von Friesen, Moriz Carrière (grouping Shakspeare with Michael Angelo, Holbein, &c.), Rümelin (the iconoclast), Gervinus the famous, Kreyssig (the German nearest to the English school), &c. 4. Mr. E. H. Pickersgill contrasted Ben Jonson's treatment of character with Shakspeare's: the one put qualities into clothes, the other held the mirror up to nature. Jonson's men were all folly in comedy, all crime in tragedy; Shakspeare's rightly mixed in both. Still, many of Jonson's characters were very striking; his plots were admirable, his lyrics delightful, his masks unequalled, his pictures of manners most valuable. Though far from Shakspeare, he was second in the Elizabethan drama to him alone.

LONDON ANTHROPOLOGICAL SOCIETY (Friday, Feb. 12).

DR. CHARNOCK, F.S.A., President, in the Chair. The following papers were read:—"Literary Dutch in Old English Provincialisms," by Dr. Alex. V. W. Bickers. The author endeavours to support certain points of Schleicher's evolution theory as applied to linguistic phenomena. Dr. Simms, of New York, exhibited and described several Egyptian skulls (some ancient), and remarked on the corresponding habits of the ages which they represented. Dr. Carter Blake, Mr. H. B. Churchill, Mr. A. L. Lewis, and the President joined in the discussion.

ROYAL ASTRONOMICAL SOCIETY (Friday, Feb. 12).

At the annual general meeting for the election of officers, &c., the Report of the Council was presented, and extracts from it read. This was a long document giving a pretty complete account of the progress of Astronomy during the past year under the heads of reports from a large number of observatories, and notices of important discoveries and investigations both at home and abroad. The biographies of deceased Fellows included those of Hansen and Mädler, and the whole Report was, as usual, ordered to be printed as the February number of the *Monthly Notices*. The President (Professor J. C. Adams) then delivered his address on the presentation of the medal to Professor d'Arrest, of Copenhagen, for his Catalogue of 2000 Nebulae, and other researches. After a masterly review of the work of the two Herschels in this branch of astronomy, Professor Adams gave an account of the successful attempt made by Professor d'Arrest to obtain accurate positions of a limited number of nebulae with a small telescope of only four inches aperture, and of the great work which he afterwards carried out with the fine Copenhagen refractor of eleven inches aperture, in the course of which many new nebulae were discovered. From a comparison of his observations with those of Sir John Herschel, Professor d'Arrest concluded that the nebulae observed by him had a proper motion of 0".4 on the average, the measures not being accurate enough for determination of the individual motions. This, the President pointed out, was an important step towards forming an estimate of the distances of these bodies, in default of direct

measures of parallax which were at present beyond our reach, and the address concluded with a review of the recent labours of other observers in the same field—Schönfeld, Langier, and Schultz, the last named having lately formed a catalogue of 500 nebulae, in which the places are determined with a degree of accuracy far surpassing all previous results in the field which Professor d'Arrest first explored.

FINE ART.

Etchings on the Loire and in the South of France, with Descriptive Letterpress. By Ernest George, Architect, Author of "Etchings on the Mosel." (London: John Murray, 1875.)

MANY readers will remember the volume of etchings which Mr. George published last year under the title *Etchings on the Mosel*, and the letter they elicited from Mr. Ruskin, which was widely circulated by the newspapers. The general purport of Mr. Ruskin's manifesto—which did not refer to Mr. George's work alone, but included or implied a severe criticism on much that has been done by the greatest masters—was to affirm the incapacity of etching to render chiaroscuro beyond the limits of simple suggestion; and he used Mr. George's work as a position from which Rembrandt and other professional etchers could be conveniently attacked. The new etcher was warmly praised for having shown a "fine, serene sense of light-and-shade," yet gently blamed for having, in spite of that naturally serene sense, wasted labour vainly in useless shading with the etching-needle, when the proper instrument of chiaroscuro was the brush. He was also told, in a kindly patronising way, that when he had learned what true light-and-shade was, he would do this no longer, and that this learning might be acquired by means of a few careful studies with brush or chalk. And then came one of the most definite affirmations ever made by a writer on art: "All fine etchings are done with few lines." This is equivalent to a condemnation of much work done by the old masters, and of the entire modern school which etches from pictures; it also implies disapproval of much modern work done independently. For example, if Mr. Ruskin is right, Rembrandt was wrong in all his shaded etchings; so was Claude; and so in modern times are such etchers as Flameng, Rajon, and Unger, who work from pictures, or Palmer, Hook, and Tayler in the English Etching Club. But to all these men and their followers who had gone wrong, one etcher could at length be opposed who was going right, or would go right if he followed the advice given him, and that one was Mr. Ernest George.

The temptation is really very great to take up the subject in the spirit of advocacy, and dwell upon the weak points in Mr. George's work, instead of quietly and candidly giving it the measure of appreciation which is its due. It would be much easier to write a strong article on the subject than a just one, and there would be this excuse for such a proceeding, that as one side of the truth has been greatly overstated, the effect of overstating the other side would be simply to restore the balance. Let us avoid, however, this too natural tendency to the controversial

method, and do full justice to Mr. George. His precise position in the art is that of a cultivated amateur who has worked within narrow limits, and succeeded in producing very charming and interesting plates, which are really all that they claim to be. More genuine work has never been published, and by genuine work I do not mean etchings done in some particular manner that I happen to like, but etchings in which the artist has proposed to himself from the first to do certain things, and then has either really done them, or else let you see where he has failed, without trying to hide his discomfiture under a pretence of doing something different. In calling Mr. George an amateur, I wish to establish a distinction between his work and that of eminent contemporaries who are artists. These etchings are not to be compared, for technical power and resource, with such work as that of Rajon and Unger, for example. In their hands etching has twenty different ways of expressing things, and the artist chooses the way that best expresses what he has to do at the moment, so that such etching as theirs is like an organ with many stops, while Mr. George has only one kind of execution at command, and little or no power of executive contrast and combination. And even though Mr. George's organ has but one stop, he has to keep very strictly to a particular sort of tune. He draws architecture well, because his professional education has enabled him clearly to understand it, and also because this professional application of intellect has been accompanied by strong affection, without which all fine art is mere cinders and ashes; but he does not draw anything else so well as architecture. In this respect there is an immense distance between Mr. George and Martial, for example. Mr. George has a far finer sense of architectural majesty and beauty than Martial has, but then Martial can draw anything that comes in his way with the most dexterous skill, and never betray imperfect accomplishment anywhere.

Mr. George has not followed Mr. Ruskin's recommendation to give up shading, and etch with few lines. There is, indeed, quite as much shading in this set of plates as there was in the first, and one plate may be mentioned (Plate X. Loches: "The Tower of Agnes Sorel") which is a decided attempt in the direction of full chiaroscuro, and not by any means a failure. Still, it does not seem to me that the strong point of Mr. George's work lies in his shading, and this for a reason which may be very easily explained. Generally speaking, there is too much texture in his shaded parts of buildings and foregrounds, and that not the true texture of the surfaces represented. This is a great peril in all kinds of engraving. Burin-work is often full of false texture of the most glaring kind; indeed, so common is it in engraving that we often have to overlook the foreground to avoid it, and get to the distances, which seem truer, because the lines are finer, closer, and less obtrusive. Unless texture can be truly rendered, the best rule is to have as little of it as possible, especially in shadow. The great fault is to give a strong texture to the engraving when it cannot be made to look like natural sur-

faces. I am glad to see that Mr. George knows the incalculable value of blank paper for open sky. There is nothing like it for space and serenity. It misses the sky's gradations, of course, but it has far more of the celestial *quality* than any shading that may be done with the point ever can have; and there is another thing to be considered, which Mr. George has probably found out, namely, the great economy of labour over the whole plate which results from the omission of shading in the sky, for if that is finished laboriously, then the same minute discrimination of tones must be carried out everywhere, and it is that which costs time and trouble in etching.

Enough, however, of these technical matters. Let us now speak of the enjoyment with which the artist has visited many quaint and interesting old places, an enjoyment fully communicated to us by his art. He goes to Orleans, and etches there the old flamboyant doorway of that fragmentary church St. Jacques. At Blois he chooses an interior, the interior of the *château*, and etches the chimney-piece of Louis XII., an edifice of carved stone reaching from floor to ceiling; but Mr. George also studies the outside of the building, and draws for us the magnificent external staircase of Francis I. At Amboise he gives an imposing view of the *château* and bridge, and another study, one of the most interesting in the volume, representing the curious and beautiful chapel of St. Hubert, which is perched on a stone-cased rock that looks just like a tower. Then we come to the strange fantastic poetical castle of Chenonceaux, which is built upon a bridge over the Cher, the castle which Diane de Poitiers coveted and got, and which Catherine de Medicis coveted too and got afterwards by the simple process of turning the other lady out when Henry II. died. Mr. George has thoroughly felt the romantic beauty of this extraordinary building, and etched it so lightly and delicately that the etching is like a dream. He has also a brilliant plate of the Warder's Tower at Chenonceaux, in which darker shades and touches are employed with great force and skill. Then we have old timber houses at Tours, a street view so entirely mediaeval that nothing but the figures and sign-boards, and a drayman's waggon, reminds us of modern times. Mr. George was particularly pleased with Loches, for its gateway and castle: he gives three etchings of this place, and would willingly have made others if the proportions of the work had permitted it. At Angers he sketches a beautiful and very original white stone Renaissance palace called the "Hôtel de Pincé." At Cahors his attention is inevitably arrested by the magnificent mediaeval bridge, with its three stately towers, and he draws it so as to exhibit the strange grandeur of it to advantage. He goes to Toulouse, and draws the interior of the cathedral from the nave, which is vaulted in one vast stone arch of sixty-two feet span, and from which you see, as in a picture, or as the scenery of the stage is seen from the body of a theatre, a choir and aisles of flamboyant Gothic, very delicately and beautifully treated in this etching. The view of Carcassonne gives the citadel from the old bridge.

"Founded on a rock," he says, "this citadel of a bygone time stands undisturbed with its inner and outer girdle of massive walls and towers. The outer walls and ramparts still remain just as they were completed and left by St. Louis in the thirteenth century, and earlier even than his time is the massive old bridge from which our sketch is taken."

Mr. George also gives us a view of the towers of Carcassonne from the wall, full of interesting constructive detail. At Narbonne he sketches the old houses which cross the water without interruption, and the sketch includes the Hôtel de Ville and the cathedral. On the Rhone he is attracted by Arles and Avignon, places which nobody ever forgets who has once seen them, and he does not hesitate to sketch such well-known and often-illustrated things as the cloister of St. Trophemus (with the saint's well), Avignon seen from the river, and the old bridge and chapel of St. Benazet.

This rather dry enumeration of the subjects will give, to all who know France, a good general idea of their character. All the plates are interesting, for Mr. George has the observation of the architect, combined with a good eye for what is picturesque in accidental groupings, and for the effect of light on buildings; but some of the plates are more refined and poetical than others. The Castle of Amboise with the bridge so strongly recalls the warm light of a summer afternoon on the Loire that it seems mellow and golden to the imagination. The Chapel of St. Hubert is an exceedingly beautiful example of treatment, which is elegant in the strictest sense of the word, and even distinguished, so far is it above the false finish of vulgar draughtsmanship; and yet so observant of everything that could help to make us feel the exquisite grace of the real building, which looks as if it had been erected for the vigils of Sir Galahad. Chenonceau is another of Mr. George's most delicate plates, but I am rather inclined to think that the full beauty of that unique edifice is felt even more strongly still when you see it at a sufficient distance to get a good reflection of it in the river. The gateway of Loches, one of the grandest mediaeval tower-gateways in France, has often been drawn before, but never better than here. One of the most perfectly beautiful things in the whole book is the white Renaissance palace at Angers, already mentioned, but well worth mentioning again for the great merits of the drawing, independently of the beauty of the structure itself; the mere etching is so airy and light and so refined in manner, the distinction between building and sky being frequently marked by nothing but the faintest of faint outlines, which is yet enough, and the shaded sides being but just a little darker, so that you are made to feel how white the building is, while all the curious ins and outs of it, the curves and angles, the arcades, cornices, pilasters, are as distinctly explained as they could be in the most elaborate engraving. It is, however, always the material in the middle distance, or rather in what the French call *le second plan*, the first plane after the foreground, which Mr. George deals with most happily. His foregrounds are usually rather coarse and unmeaning, while his

distances are uniformly slight in the extreme, unless the distance is itself the subject, as in the citadel of Carcassonne. But whatever may be said in the way of technical criticism, the general impression which these etchings leave is very delightful. They are well worth having, and worth keeping too; for it does not follow that work will be soon exhausted merely because it is not greatly laboured. Pleasant as were the etchings on the Mosel, I decidedly think that on the whole the present publication is stronger and more beautiful. Finer subjects could not be chosen, and there is not another etcher living who would or could interpret them in this peculiar and very interesting way. I do not wish to imply that Mr. George is the greatest of living etchers, or anything like it; indeed, he evidently makes no claim to be more than an amateur of etching, having the knowledge of a professional architect at his disposal; but it may be said with perfect truth that nobody living etches architecture with such thorough knowledge of structure, in combination with such a delicate appreciation of the effect of light on buildings.

P. G. HAMERTON.

THE DUDLEY GALLERY.

(Second Notice.)

THIS year, as in previous instances, the principal portrait-painter in the Gallery is Mr. J. C. Moore. *Robert, son of R. Norman Shaw, Esq.*, a handsome boy of some five years of age, is seated on an antique chair, holding reins and whip for playing at horses; finely done, but a little too meagre in surface. *Winifred Holiday*, with a fiddle, and in a whitish dress, is another very agreeable child-portrait. *The Marquis of Downshire* is still younger than the other boy, with a pink-and-white complexion, and a certain air about him which foreshadows the aristocrat. His dress is blackish grey; he handles a hoop and stick, which might be more entirely in keeping with an outdoor subject than with one where a chair covered with crimson Utrecht velvet forms the chief background object. *Little Agnes*, with golden hair, in an old-fashioned garden, has the puffball of a dandelion in her hand. Evidently Mr. Moore is, as he deserves to be, much in request with "parents and guardians" for their infant charges. The *Portrait* by Mr. James Macbeth is also in a bright lightsome key of colour; a lady in a Japanese dress, holding a shell to her ear. Mr. Clifford's best portrait is that of *The Earl of Tankerville*; carefully handled, and with an apposite look of habitual command in the face, while all details of costume are of the most inconspicuous sort. Miss Helen Thornycroft exhibits a *Study of a Head*, a warm-natured lady, with impulse and resolve in her countenance. Miss Edith Martineau shows completer training in her half-figure named

"There is a garden in her face,
Where roses and white lilies blow;"

which is considerably like, and not much inferior to, portraits which Professor Poynter has displayed from time to time. We cannot say, however, that the expectation of freshness and amenity raised by the motto is at all fulfilled by the pictured visage; and must conclude that Miss Martineau has been less successful in catching the character of her sitter than in the artistic execution of her work. Blue china figures prominently in the background.

In treating of the miscellany of skilful or pleasant landscapes which this Gallery contains, we shall take them much as they come on the walls, without preciser ordering.

Darvall, *From the Campanile of Torcello*: a beautiful and serviceable lagoon-study, giving a

bird's-eye view, almost like a map or plan in quality, yet rightly picture-like—the colour capital. Henry Moore, *Afternoon, Cardigan Bay*: fine, with its varied cloudy sky. *After Sunset, Normandy*: somewhat out of this excellent painter's usual way, with a deep-red sky canopied the land. F. G. Cotman, *Wargrave Church, from the Thames*: a winter scene, with leafless trees and sere sedges, all touched off with uncommon lightness and elegance. Alfred Parsons, *The Dead and Dying*: a park-view in late autumn, full of easy truth. Joseph Knight, *A Morass*: a comparatively large work, fine and dark. It has been a heavy rainy day, and the sky is setting-in for the evening darkness, as a man launches his punt upon the mere: very complete in realism, and in simple depth of sentiment. *After Sundown*, by the same painter, claims similar encomium. T. M. Hemy, *On the Tyne*: much like the work of Mr. C. Napier Hemy, with rather less strongly marked manner; the subject well characterised by its crowded shipping, its smoky vapours, and its rough-and-ready riverside buildings. *The Trawlers, Morning*, by the other Hemy, is a bold able work, with effective lines of composition—the manipulation very simple, as well as telling. Arthur Severn, *Hail-Storm at Venice, June, 1872*: a noticeable study of something which the painter has evidently seen, and fixed his attention upon. The drift of hail rains down the hollows of the Ducal Palace and the State Prison in sidelong spouts, as if from a syringe, its edges scattered by the wind. Street stalls and café-chairs are overturned: men drag lustily at a fishing-boat, and lash it on to a post on the pavement. *Cheyne Walk, Old Chelsea, before the Embankment*, shows the line of shops, and that huddled group of old houses reaching up towards Battersea Bridge which the improvements have swept away, and which residents in the locality could not manage to regret in spite of its picturesqueness. The church tower also forms a principal object in this well-studied composition. Tom Lloyd, *Low Tide*: carefully rendered, with the recession of its waves, one behind the other, grey-tinged and yellow-tinged. Albert Goodwin, an unnamed subject, No. 231: fine, and not unlike Alfred Hunt in style. A flock of sheep winds over a hilly moor, with a stream in twilight lumour in the hollow. Gertrude Martineau, *Recollection of an Autumn Evening at Hampstead*: expressed with a soothing charm of sentiment; blue mist lingers and deepens under a pale yet rich sky, orange and salmon-tinted. Mrs. Bodichon, *Cornfield, Sussex*: rapid, vigorous work: the trees move, and the whole scene lives. *Near the Land's End* has what it should have as the primary elements of the subject—wildness and space. Thomas J. Watson, *Moonlight, Corbridge*: very good, and not much unlike a David Cox; the turbid grey sky strikingly given. Tristram J. Ellis, *Loch Awe*: one of the larger landscapes, grandly felt, and realized manfully. The lake broods, dark like indigo: the hills, with snow in their hollows, are silent, and almost untrodden, save for the hardy close-cropping sheep; a great slope of verdure reaches upwards to the right. Weedon, *Mountain Burn near Kinlochewe, Ross-shire*: true in observation, and intelligently handled. Robert Macbeth, *London Lights*: as much figure-subject as landscape,—a stage-coach of the present day, pausing at a country-tavern near London, whose multitudinous lights give massed lustre and meaning to the distance. This is an excellent little picture, which one can look at long. Bedford, *Slopes of Skiddaw*: solid in tint and tone, and altogether a superior work.

Numerous as are the landscapes which we have here briefly noticed, there are still many others deserving attentive inspection, whether by visitor or critic. We can only name—C. R. Aston, *A Winter Sunset on the Tiber—Rome from the Pincian*; C. E. Holloway, *Old Shoreham*; F. A. Hopkins, *A Wet Day at Hespenthal, Pass of St. Gothard*; Anna Blunden, *Venetian Fishing-boats*;

C. H. Cox, *Winter in the Mersey*; Hamilton Macallum, *Catching Sprats—Wind off Shore*; A. E. Fisher, *At Mouth Mill, near Clonelly*; J. J. Bannatyne, *Ardochornel Castle, Loch Awe*; G. L. Hall, *The Tide of the Solway*; John Parker, *On the Thames near Sutton Courtenay*; Donaldson, *The Teme at Ludlow, Evening—The Reader's House, Ludlow—The Teme at Tenbury, Morning*; Pilsbury, *The Garrulous Brook*; William Moore, *Waiting to Cross the Dudden Sands*; Frank Walton, *The Castle-bridge under Sleive Donard, co. Down*; W. S. Goodwin, *Evening*; Bingley, *Winter*; R. W. Fraser, *Cox's Pits, near Bedford—On the Ouse, December*; John Parke, *By the Brooklet*; Cuthbert Rigby, *Forge Hill, Eskdale, Cumberland*; Peter Toft, *On the Mattenwiete Canal, Hamburg*; Harry Hine, *Chichester Harbour, from Appledram*.

About the very best thing in the Exhibition is an animal subject by Mr. Heywood Hardy, named *Camp Followers*: really a grand piece of work, full of observation, strength, and fine design, entitling the artist to rank among the foremost animal-painters of our time. It represents seven vultures, in grim fellowship and grim expectation, for a fight is going on below: they are perched on a ridge of rock, and scent the slaughter from afar, knowing that their hour is nigh. The actions of these birds are all various and all true, and so high in manner as to be monumental, without any overstraining: the wings in each case are furled, but in none with a motionless look. In study and exactness this painting is hardly inferior to Mr. Wolf, while in general pictorial result it surpasses the great majority of his renderings. Another study of the same kind of raptorial birds is the *Three Black Vultures*, by Mr. Tristram Ellis (already mentioned as a landscape-painter). It is a sound direct study, in which expression has been particularly aimed at; the birds being marked respectively as "Contentment, Thought, Enquiry," and the character very truly conveyed in each instance. Mr. Mark Fisher, again, is an extremely able painter of animals with landscape. His *Cattle and Landscape, Normandy*, is broad and clear, harmonious in its verdure, and pleasant in daylight—a vigorous enjoyable work throughout. *Bringing Sheep from the Fell, Styhead Pass*, by Mr. J. J. Richardson, is also to be commended; and Mr. Percy Macquoid is clever and amusing in his work named *Bored*—a King Charles spaniel receiving in rigid silence the attentions of a white Persian cat which rubs up against him. With less facility, there is also a good deal of expression in Miss Anne Salter's work, *What Cat's Averses to Fish?*—a bowl of gold-fish watched by a white kitten and a tabby one.

For studies of flowers or vegetation, we may cite the contributions, some of them uncommonly nice, of Edward Hull, Kate Carr, M. Caroline Agnew, Helen Coleman, Mrs. Whympier, Isabella Green, Miss J. Samworth, and Mrs. Pratten. A good interior is *The Deserted Hearth*, by Mr. H. J. Hanhart, showing a cheerless fireplace, with two horse-shoes nailed up over it; likewise the *Chamber in the Prison of the Old Spanish Inquisition, Antwerp*, a sufficiently stately and inviting sleeping-apartment, by Mr. S. Read. Still-life is well represented by Mr. J. T. Wilson, Miss Agnes MacWhirter, and Miss Mary Corkling.

W. M. ROSSETTI.

ART NOTES FROM PARIS.

Paris: February 7, 1875.

I had intended to speak in my present letter of a number of publications, widely differing in character, yet all having a more or less close connexion with Art. But I have heard a piece of news of which I cannot refrain from saying a few words.

You are aware that for the last two months the project had been under consideration of opening at Paris in the month of April next a general exhibition of all the finest pictures of every school in the possession of our various provincial Museums.

The majority of these Museums were established at the Great Revolution, on the model of the Art Museum opened by the Republic at Paris, and afterwards known as the Louvre. The municipalities took pains, in many large towns, to bring together under one roof, and to exhibit for the general benefit, the pictures which had become useless in the churches, where service was no longer performed, or which had been confiscated in the country-houses abandoned by the *émigrés*. The most minute instructions, set forth in special reports, were sent by the Convention to the municipalities, with the object of saving these precious relics of a society that was crumbling away. Sufficient attention has never been called to this act of practical philoecopy, so much the more meritorious as fashion was pronouncing energetically against the depraved doctrine of the French school at the end of the reign of Louis XVI., and as the aristocracy had never taken any steps whatever toward effectually initiating the popular classes into the critical and enlightened admiration of works of art. Later on our provincial Museums were enriched with the overflowings of the Louvre, which, considered as a kind of library of pictures, was only to contain classical works, that is, productions of the Italian school—not of the early masters, who were then thought barbarous, but in most cases of masters without accent and without truth, belonging especially to the school of Bologna. Finally, beside important legacies, such as the Wicar bequest to the Lille Museum, and the Fabre bequest to that of Montpellier, &c., our provincial Museums received year by year the best pictures acquired by the State at the close of the official Salons.

There are, then, in the provincial Museums works, ancient or modern, of real importance, which are almost wholly unknown, and have only been described in the very inadequate book of one of the Keepers of the Louvre, still in office. A general exhibition would have made us forget it altogether, or enabled us to rectify its blunders. It would have given rise to special monographs, and to some great volume of photographs. Several of these Museums, like those of Lille and of Nantes, have good catalogues. But the rest have scarcely any thing of the kind; that is, they have only notices which are not on the level of modern criticism. It is believed that it is the dread these keepers have of seeing their errors unmasked, their false attributions rectified, their repose disturbed, that has caused the most serious opposition to this central exhibition, by which the whole of Europe would have profited.

In short, after much hesitation, the majority of the municipalities, though warmly invited by the democratic press, which has shown itself enlightened as well as firm, have officially refused to entertain the proposal. It was not brought before them with sufficient tact, and was first suggested to M. de Chennevières by blunderers who have already enticed him into certain very compromising adventures. The Union Centrale, of which I have often spoken, had made an offer to the Director of Fine Arts to raise a wooden palace in the Place du Carrousel, to meet all expenses, and to distribute the surplus to towns maintaining schools of design. This project was good in principle. But it was evidently too far ahead of the provincial mind. The provinces will continue to nourish feelings of hatred against Paris, though Paris is no longer, as under the Empire, a centre of depravity, until the progress of general political education has made it everywhere understood that capitals, too, have a civilising influence of unique importance. It was alleged as an excuse for the refusal that an exhibition in wooden sheds would be exposed to the risks of fire, which is only relatively true, since the keepers of your galleries, prudent as they are, are satisfied with it at the South Kensington Museum, and under many other circumstances. The enterprise was too risky. It is excusable that towns which have spent considerable sums in raising rich and suitable

monuments to their collections, should be jealous of preserving them, and should consider themselves scarcely justified in parting for six months with the riches belonging to their commune. Perhaps also they feared that criticism, which has no respect save for the truth, might bring down from their eminence doubtful masterpieces, bought at public sales or accepted as a bequest. In fact all was asked of them, and all was too much.

I believe that a more certain result might have been obtained by adopting the principle of successive loans. When you wished to see all the historic portraits of England, you divided them by centuries. You got them in succession with scarcely an exception. So, too, we ought here to have asked for each school in succession. It would have been patriotic and fitting to begin with the French school. France has no idea of the force, the grace, the variety of her school. From the invasion of the Italian Renaissance, so fatal to our national genius in the sense that it inspired in the minds of our upper classes, that it infused into the blood of our professors, the mania for foreign imitation—from the invasion of the Italian decorators of the sixteenth century down to our own days, our school has been the victim of every form of misunderstanding and injustice. The pedantic and ignorant reaction of David's pupils triumphed with such insolence until the great battle of Romanticism that France unlearned the very name of artists of the highest merit. In the first edition of a book which passes in review the chief Museums of Europe, an author whom I will not name because he is an honourable man, and because he has gallantly atoned for his error—this critic, finding some pictures by Chardin in a Russian Museum, carelessly remarked, "There are also here some pictures by a certain Chardin, with whom I am unacquainted, but who seems to me a fairly good painter." Such is the degree of ignorance and apathy to which men are brought by authoritative doctrines applied to the control of the arts. People shrugged their shoulders at the Messrs. de Goncourt, while they were bringing together their magnificent collection of sketches and water-colours wholly due to masters of the eighteenth century; and the earlier instalments of their works on the life of these masters, Watteau, Greuze, Boucher, Fragonard, &c., called forth the sharpest criticisms. Messrs. Lacaze and Marcille collected their Watteaus, their Bouchers, their Chardins, at the brokers' on the quays. It is now fully conceded that they were in the right, and I say that the moment has come for showing in a general exhibition how much grace, force, and variety is to be found in that native art which first arises in the miniature painters of fourteenth century MSS. It would be perhaps the heaviest blow that could be struck at the School of Rome and at all the vices proceeding from it in our official or private instruction. I wish that this idea may make its way, for I believe it rational and practical. The provincial towns could not refuse to figure in an exhibition of so clearly determined a character.

I have left myself but little space to speak of new books, though that is an international question that I should be glad to treat of from time to time in some detail. But events are constantly overturning our resolutions, and scarcely leave us time to cast a hurried glance on the ground that we have already traversed.

M. Henry Jouin has just published in one volume, octavo (Plon), a series of articles contributed to a newspaper on *Sculpture in the Salon of 1874*. The first part of this work shows a great love for aesthetics; and those who treat of these inoffensive and cosmopolitan matters will be able to quote passages on the subject of the real, the ideal, and the divine in Art. The second part is more directly interesting as recalling the names of artists and the titles of works that sometimes escape the memory. M. Charles Nutter publishes (Hachette) a duodecimo volume containing sixty woodcuts, entitled *Le Nouvel Opéra*. M. Charles Nutter was nominated Keeper of the Archives of the

Opera just when M. Charles Garnier was beginning his labours. He has followed the artist and his work step by step, so that we must not look for criticism in his book. Everything is perfect, everything is in the best taste, everything has been foreseen. But the documents quoted are very curious. They show in M. Garnier an indefatigable power of work, as well as talent for stimulating the exertions of his partners in the task, for of these he has had many. The main divisions of the book are—a history of the competitions for the new Opera-house; the exterior of the building, the interior, the archives and library, special accessories, and general statistics. Many quotations might be made from the anecdotes, typical features, and curious details. I must confine myself here to certifying that the book is agreeable reading, and that it is less costly than the sumptuous casino it describes. To M. A. Poulet-Malassis, under the Empire at Paris, was due the real credit of reintroducing editions strictly artistic in the selection and arrangement of the type, the quality of the paper, the uniformity of the printing, the relation of margin to text—in a word, in all those outward conditions which make a good book doubly precious, like an agreeable woman who is pretty to boot. M. A. Poulet-Malassis publishes a second edition, revised and greatly enlarged, of a work on French book-plates (*Les Ex-libris français*). I do not know whether your collectors have been attacked by the same mania as ours. After first exhausting original editions, our collectors next hunted up bound volumes bearing coats of arms on the outside of the covers; then, when all these had been withdrawn from circulation—when the stall-keepers' boxes, ranged along the parapet of the quay, had been emptied of volumes with armorial bearings—they next set to work to take off the book-plates which the proprietors had pasted on the inside of the covers of their books. Some amateurs have collected several thousands. M. Malassis has classified them systematically, with an historical instinct, a degree of learning and philosophic irony which impart the rarest savour to his work. He has confined himself to the book-plates of French libraries, although our bibliomaniacs were in the sixteenth century anticipated in such marks of ownership by the Germans and Italians. The oldest mark of a French library hitherto discovered is that of a bibliomaniac of Autun, "Ex bibliotheca Caroli Alborii E. Eduensis," with the device, "Ex labore quies," and the date 1574. The whole history of France is afterward passed in review. Then come some amusing notes on a number of singular book-plates—those of the witty President de Broches, of the gourmand Grimois de la Reynière, of the journalist Champcenetz, of Boyveau Laffecteur, that of the druggists, the benefactors of humanity. The list of masters who have engraved or designed these emblems, in which the wit or the follies of the possessor often find vigorous expression, includes the names of Boucher, Gravelot, Charles Eisen, Chaffard, and in our own days of Bracquemond, who presented some curious examples to his friends—Manet the painter, Christopher the sculptor, Asselineau who is but lately dead, and others. An album is added to the book, which contains twenty-four very exact reproductions. The book is exhaustive of the subject. PH. BURTY.

THE STUDIOS. I.

MR. WATTS, R.A., will not, in all probability, be represented at the next exhibition of the Royal Academy by any very important work. His portrait of the Dean of Christ Church we have already mentioned, and he is now engaged on a portrait of the Lord Chief Justice. Quite recently also he has commenced carrying out, on a large scale, his long familiar design of Love and Death. This painting is not, however, sufficiently advanced for us to have any hope of seeing it on the walls of the Academy next May. The motive is one of

the happiest, if not the happiest ever selected by Mr. Watts. He sometimes seems to come short in his bravest efforts, just from a curiously imperfect apprehension of the inevitable limits of pictorial design. He tries now and again, so it would seem, to paint a thought which cannot be conveyed without words. But Mr. Watts's Love and Death is a motive lying well within the limits of *rein künstlerische Gedanke*, and he himself has felt this. Many times he has repeated it, always with some fresh touch of happy variation, or addition;—some springing of asphodel blossoms, even where the oncoming feet have left their cold print, some light of life in the darkness, some grave line of fateful awe paralysing the passion of resistance. The doorway stands not open, nor shut, and filling the threshold to the right springs Love winged, and stung by the prick of sharp emotions to dare the dread struggle with Death himself; to the left rises the shrouded form which must enter, and must enter now. This situation wants no word of explanation, or comment, not even the two words Love and Death. They themselves are there. Every soul may see its own sorrow. A sympathetic instinct which has the fine edge of true artist inspiration pours out to us everywhere with subtle influence from line after line. The action of Love, very noble and dignified, is charged to the full with complex emotion. The uplifted arms have on the first wild impulse stretched themselves forth to thrust away the irresistible Terror; but the right falls, the left is falling, the very sway of the body outwards speaks of arrested action, tells its own tale of dumb anguish, of the weight of sullen necessity. Out of the long enwrapping, many-fold garments of the advancing shape falls even upon us the oppression of unnerving fate which leaves us passive at last beneath the sharpest pain. There is no struggle of vain rebellion, passion sinks powerless into the drear calm of numbing despair. To have made his own a motive like this which is penetrated so deeply with universal human interest, to have embodied it in a pathetic and dignified form, is fortune such as comes only perhaps once in a lifetime, comes only to those who are strong enough to devote a life to waiting. In Love and Death Mr. Watts has shaped for us the hidden thought which lies intimately folded within the lines of every labour and of every joy; he has given us a gift for which we may all be grateful.

The dark shadows of life, into which we look with troubled thought and disturbed vision, do not seem to offer their inspiration to Mr. Leighton. We cannot keep in watching them that peace of soul and strength of mind which go to successful vision of things strong and beautiful, even when burdened with the labour of serious effort. His Procession of the Daphnephoria promises to be eventually the most considerable achievement both in point of size and general importance which he has yet made for us. The brilliant realisation of a theme which demands the completeness of sight, the unmistakable forms, the serene gaiety and beauty of broad daylight. But of the Procession of the Daphnephoria we shall hope to speak at length by and by; for awhile the work stands still, to be resumed again when the immediate pressure of other engagements pauses. The model of the great athlete, of which we have before spoken, is also waiting, and in this, too, we may hope to possess, when another year or so has passed, yet another source of noble pleasure. For the present, beside other smaller works, Mr. Leighton has in hand two considerable paintings. One is the interior of the Mosque at Damascus, an interior which has never yet been painted, full of suggestions of lovely peaceful colour which have now found an adequate interpreter. The delicate variations of tone with which the whole extent is shot find a culminating point in a charming foreground group. A young girl, her face lovely with an innocent shy bloom, stands out accom-

panied by an older attendant, and the bright luxury of her dress and air is prettily contrasted by the severely black robes and white turban of a third figure in the near distance. This picture is sure to obtain the same happy popularity with which the two Eastern scenes exhibited by Mr. Leighton in last year's Academy were greeted. His other work is of a wholly different class. It will not please so many people, but it will be the more deeply valued by a few. This second picture is *The Slingers*. The motive of this second picture is furnished by a custom of long tradition in the East. Mr. Leighton himself had seen it practised in Nubia at Philae. In the wide fields of standing corn detached scaffolds are raised; on these the slingers stand. At their feet a heap of clay, from which they form the balls which they cast at the birds preying on the grain, shouting at the same time loudly as they fling. In Mr. Leighton's composition the edge of this scaffolding is seen running right along at the base of the picture. On it the tremendous form of the furious slinger rears itself in definite outline, sharply detached against the fast-darkening evening sky. This figure is the object of the whole picture. Above the broken lines of the heap of clay, lying on the boards beneath his feet, we see the broad waves of the fields of ripe grain, over their edge on the right the great disk of the eastern sun settling slowly down, the circle line just infringed further still to the right by the far distant form of a woman, she also a slinger, standing too on her separate scaffold. The woman is clad in a thin long striped robe, and the cords of the sling from which she has just discharged her missile, recoiling, twine themselves, closely knotted, round her limbs. But this second figure, though in itself interesting, is merely a detail which breaks the level line, that else might carry itself too evenly along, repeating the straight stroke of the scaffold planks in the foreground. The mighty bronzed figure which fills the canvas absorbs the attention completely: at first we see nothing else. He is in the very act of throwing: his head is thrown back, the backward thrust of the left arm helps the action, the uplifted right hand grips the strings which pass behind the head, and to the right we see the ball still retained, but on the point of parting. It must not be felt that this is a mere painting of incident, the figure of a man shouting and slinging. It is a work the carrying out of which has been in accord with the conditions of a definite intellectual conception, every line of which is laid with serious calculation and effort; so that finally those who will give the necessary sustained attention, who will look in something of the same spirit as that in which the artist has worked; who will endeavour to receive and feel, instead of attempting to adjust his work to the quality of their own previous conceptions, may receive something of the highest pleasure which our nature affords, the pleasure which comes of apprehending the relations of lines noble in themselves, and combining (governed by a ruling intention) to issue in a pre-ordained and definitely conceived harmony. The action of Mr. Leighton's slinger carries the lines of the composition from the right at the base upwards towards the left, but this direction is subtly corrected by the suggestion of a strong perpendicular line which is obtained, partly by the movement of the left arm, and by the position of the ball suspended directly above the left shoulder. At the present moment the picture is by no means finished; but both as to the carrying out of the whole design, and as to tone, it is quite sufficiently advanced for us to be able to realise completely Mr. Leighton's ultimate intention. The extreme simplicity of the treatment, the moment selected—the solemn close of the long day, gradually darkening about the solitary figure to whom it has as yet brought no rest—renders the general aspect of the subject very grave and impressive. It is quite different from anything else which we have had from Mr. Leighton, and yet

we at once recognise it as peculiarly his. I shall hope next week to give some further account of the works in progress at several of the other studios.

E. F. S. PATTISON.

ART SALES.

THE Chintreuil sale of the 4th inst. produced 130,000 fr. Pictures for which, in his lifetime, amateurs refused to give the artist 200 or 300 fr., sold for as many thousands. *The Fonds d'Igny, in the Spring*, 4,000 fr.; *The Potatoe Field*, 2,950 fr.; *Autumn Evening*, 2,700 fr.; *Path in the Wood of "Bruly,"* 3,100 fr.; *Close of a Fine Summer's Day*, 1,200 fr.; *Evening Vapours*, 4,900 fr.; *The Sun drinks the Dew of the Morning*, 5,600 fr.; *Valley of Courgent, Setting Sun*, 3,000 fr.; *Apple Trees in Flower*, 1,240 fr.; *The Pond of Millemont*, 2,225 fr.; *Entrance to the Village of Courgent, effect of Snow*, 3,300 fr.; *The "Route blanche,"* 4,680 fr.; *Row of Poplars in a Meadow*, 2,400 fr., and Chintreuil's painting, *The Fields on the First Dawn*, rejected from the Salon of 1863, sold for 9,800 fr.

THE collection of the late Baron Thibon was sold at the Hôtel Drouot on the 9th and following days. Its most remarkable features were the five magnificent groups by Clodion in terra cotta, of exceptional beauty:—Lot 1. *Three Nymphs Standing*, sold for 14,100 fr.; *A Bacchante and Child*, 10,500 fr.; *A Sleeping Bacchante*, 2,700 fr.; a bas-relief, *A Bacchante surrounded by Children*, 2,120 fr. Of the other objects, a snuff-box, ornamented with eight miniatures by De Gault, sold for 2,120 fr.; Boucher, *Cupid practising drawing his Bow, and Sleeping Cupids*, the two, 14,600 fr.; another, *Cupids playing in the Clouds*, 4,100 fr.; De Heem, *Fruits, a Ham, and Silver Vases*, 3,300 fr.; the same, *Breakfast*, 1,180 fr.; Fragonard, *Danae*, 1,200 fr.; Heilmann, *The Young Housekeeper*, 2,805 fr.; Lagrenée, *Nymphs Bathing*, 2,950 fr.; Joseph Vernet, *Seaport*, 3,060 fr. The three days' sale produced 225,106 fr. (9,004l.).

THERE is now exhibiting at Messrs. Phillips and Son's rooms in Bond Street, the *Virgin of the Rosary*, an important work of Murillo, which is to be sold on the 26th. It has been brought from Seville, where it has been for many years in the possession of Don Antonio Ruiz Tagle. The picture represents the Holy Virgin seated, holding on her knee the Infant Saviour; she has in her hand a chaplet or rosary. The head of the Virgin is surrounded by a glory of cherubs, above which is a choir of angels; below, a number of child-angels bearing lilies and other flowers. There are above eighty heads and figures in the composition, which is painted with great feeling and delicacy. The subject has been often painted by Murillo, but little is known of the history of the present picture. It is 8 feet high by 6 feet 9 inches wide.

THE *Dusty Road*, one of Linnell's masterpieces, was sold at Christie's on the 6th, in Mr. Earl's sale, for 950 guineas.

NOTES AND NEWS.

AN interesting discovery has been made at Pisa. The noble family of Pesciolini possessed in Pisa one of the handsomest palaces in the city. It contained some interesting works of art, among others a statue of St. John given to Donatello. This palace, long uninhabited and neglected, was sold to the Count Rosellini, when the statues were submitted to the judgment of the sculptor Signor Salvini. He pronounced the supposed Donatello to be a statue by Michel Angelo, and in all probability that St. John which, as Vasari relates, was sculptured by the great master for the Duke of Urbino, that is, Lorenzo de' Medici, father of Catherine of France. A number of sculptors and other artists have seen it, and there is not a

dissentient voice among them: all are agreed that it is a work of Buonarroti. The Count Rosellini liberally allows it to be seen; in this resembling his countrymen generally, who have so much pleasure in allowing natives and strangers to see the works of art which they possess.

It is with deep regret that we record the death of M. Emile Galichon, the well-known critic and writer on art. M. Galichon was one of the earliest contributors to the *Gazette des Beaux-Arts*, and his editorship of that journal marks its period of highest merit. No one perhaps did more than he to revive the art of etching in France. His studies were principally directed to the elucidation of disputed points in art-history, more especially to those connected with the history of engraving, and his various articles in the *Gazette*, on the Italian engravers and their works, are most important contributions to our knowledge of the subject. In 1861 he published a work on Albrecht Dürer—*Albert Dürer, sa Vie et ses Œuvres*—but he is chiefly known by his periodical writings. Beside being a writer on art, M. Galichon was also a great collector, and has left a number of valuable engravings and drawings, principally of the early Italian schools, though Rembrandt and Dürer also came within the range of his sympathies. His death took place last week at Cannes, after a long period of illness.

M. BARYE, the great sculptor, is seriously ill.

GERMANY has within the last few days lost two painters of more than ordinary merit, namely, Baron Arthur von Ramberg and August von Bayer, the former of whom was born in 1819, and the latter in 1804. Professor von Ramberg, who had received his training in the Munich schools, after holding a chair in the Academy of Art at Weimar returned to the Bavarian capital, where till the close of his life he continued to teach in the halls of the Munich Academy, and to paint the large historical frescoes and smaller genre pictures which have secured for him a well-earned reputation. One of his best known works is his large painting in the gallery of the Maximilianeum at Munich of the *Emperor Frederick II. holding his Court at Palermo*. August von Bayer, although a Swiss by birth, was by education a thorough German, and during the last twenty years of his life his post of "Conservator" of the Antiquities of the Grand Duchy of Baden, had led to his continued absence from his own country, and induced him to choose Karlsruhe as his residence. His paintings, although partly belonging to the historical and genre branches of his art, are all architectural in character. Among the best-known of his works is the view of the Minster at Freiburg, and his little genre picture of the *Organ-Player*, which has been copied and reproduced in various forms.

THE Académie des Beaux-Arts, in its sitting of the 6th inst., elected MM. Dewinne and Enghes corresponding members in the section of painting, as successors to Baron Wappers and M. Fortuny.

THE proposed exhibition in Paris of the best paintings from the provincial museums, with the view of raising a fund for establishing schools for drawing, has, as stated in our letter from M. Burty, fallen to the ground. The application made to twenty-five of the principal museums of the departments has been favourably received only by Tours, Angers, Rennes, Le Mans, Cherbourg, Le Havre, Besançon, Avignon, and Narbonne. All the rest have refused to join the enterprise. The project has, therefore, been abandoned by the Administration.

THE *Journal Officiel* announces that there is now on exhibition in the municipal palace at Angers, for the benefit of the poor of that city, the *Danae* of Titian, one of his masterpieces, formerly belonging to the Buoncompagni of Bologna, but now purchased by the Emperor of Russia for 630,000 fr. (25,200l.).

THE Norwegian painter, Professor Gude, has been called to Berlin to be Director of the Royal Academy of Fine Arts, which since the death of Schadow, in 1850, has been in a very confused condition, and which has now been completely reorganised. The fact that a foreigner rather than any of the native artists of Germany has been selected to fill this honourable and responsible post is no small tribute to Gude's acknowledged genius.

THE German papers announce that the clay model of the Schiller monument, to be erected at Marbach, the poet's birthplace, by Herr Rau, of Stuttgart, is now complete, and has been sent to the foundry of the Messrs. Pelargus, where it is to be cast in bronze, and is to be ready for removal before the beginning of May, 1876, in the course of which month it is to be unveiled with an appropriate ceremonial. Schiller is represented at about the age of twenty-six, when he had written *Don Carlos*; and all who have seen Herr Rau's model are agreed in considering that both as a portrait, and a work of art it is highly satisfactory, and does great credit to the young artist, who has succeeded in reproducing a likeness of Dannecker's well-known bust without marring the general originality of his conception. The poet, who is represented standing, is dressed after the fashion of a century ago, and the artist, it would appear, has been especially successful in his manner of arranging the dress, and by his mastery over the plastic details of his work has given a freedom and grace to the drapery, not often observable in such adaptations of a costume essentially devoid of beauty in itself.

At the last meeting of the Archaeological Institute, at their rooms in New Burlington Street, on February 5th, a very interesting paper was read by Mr. C. Drury Fortnum, F.S.A., upon the number and probable authenticity of the usually recognised portraits of Michel Angelo Buonarroti. Considering the period of the artist's death, the abundant opportunities then existing for preserving undoubted likenesses of the great men of their age, and the high reverence in which the recognised master of the fine arts was held, it is remarkable to find how small a number of the likenesses can lay claim to be thoroughly credited. Of the eight or nine now existing, several appear to be replicas, or copies with slight variations, of the bust in the Capitol at Rome, ascribed to either Giacomo della Porta or Daniele di Volterra. Another to which all confidence can be attached is the bust by Lorenzi upon the tomb, which is known to have been modelled from a mask taken after death. But the knowledge we possess of the great artist's features is probably mainly due to the excellent medal made from life by his personal friend Leoni Aretino, who by the way (as the lecturer reminded us) was not of Arezzo, notwithstanding that his name implies as much, but was born at Menaggio, on the Lake of Como. It was therefore with great pleasure that his audience saw exhibited by Mr. Fortnum a wax medallion, slightly smaller than the well-known bronze (of which many good impressions exist in various collections) in a small oval gilt frame. This interesting object had been discovered by the lecturer himself in the possession of a lady lately deceased. Upon examining the frame, Mr. Fortnum found that it was backed by a piece of stout paper, on which was inscribed—we render it in English—Portrait of Michel Angelo Buonarroti, taken from life by his friend Leo Leoni Aretino. Such a *trouville*, to use a lawyer's phrase, almost "proves too much," and certainly if produced by some dubious dealer with a heavy price attached to it, very careful scrutiny of paper, ink, and other circumstantial evidence would be exercised before the claims of the new-comer to rank as an original could be deemed admissible. But, after all, these accessory arguments, even when, as in the present instance, they are satisfactory, are comparatively unimportant. If a work do not bear in itself its

own credentials, all external evidence may be fairly set down as, if not erroneous, certainly unimportant. It would be difficult, we think, for any one to examine carefully the life-like features of the worn, intelligent face here modelled, more life-like than the medal itself in so much as wax even to the hand of a medallist is more tractable than metal, without believing that we have before us the very wax, taken from life by his friend, as the inscription informs us, to which we owe our clearest impression of the features of Michel Angelo. Mr. Fortnum mentioned in his interesting lecture that he had learnt from Mr. Hibbert, the late owner of the portrait, that it had been often an object of admiration to Signor Pistrucci, the celebrated artist of the St. George group of our crown and sovereign pieces, and of the Waterloo medal.

M. GARNIER's successful application of mosaic in the decoration of the new Opera-house in Paris has led to the idea of establishing a school for artists in mosaic in France, where they may be taught the art that Ghirlandajo was wont to declare "was eternal, while that of painting was fleeting." Schools of this kind already exist in Italy and Germany, and South Kensington has many students who work in mosaic; still the art is comparatively very little practised at the present day. Its revival would open out a new and effective means of decoration. It is proposed that the school shall be erected at Sèvres, and that, at first, some of the Italian artisans who have been working under the direction of Signor Facchina in the Opera-house shall be employed as teachers.

THE *Portfolio* this month is distinguished by a very effective photo-engraving, as it is called, of a picture by Pierre Billet, an artist who has lately attracted much attention at the Salon exhibitions. René Ménard points him out as an artist of whom "one may foresee the day when his name, already familiar, will become celebrated." The *Portfolio* does good service in making known such artists to the English public. An article on "Greek Coins, as illustrating History and Art," being the substance of a paper read at the Burlington Club last October, is contributed by Mr. Virtue Tebbs, and a review of the "Winter Art Season," by Mr. Comyns Carr.

THE fourth number of *L'Art* contains some clever studies of animals by Aug. Lançon; a vigorous sketch by Gavarni of a Scotch beggar boy drawn from nature, and an etching by Greux from a painting by Diaz—a landscape with horses.

THE STAGE.

THE "MIDSUMMER NIGHT'S DREAM" AT THE GAIETY.

THERE can be no doubt that the revival of a taste for Shakspeare is a good thing. The substitution of poetry for the senseless rhymes of burlesque, of the highest for the degraded forms of the drama, ought to be matter of rejoicing to playgoers. When a play which is the essence of grace and poetry is divested of all beauty and interest, when scenes instinct with life and tenderness are so delivered that they might as well be rude and dull, when it becomes possible to understand why Pepys set down in his diary that the *Midsummer Night's Dream* was the most insipid, ridiculous play he ever saw in his life, one may regret that the performance of the play has been attempted. It is true that the stage representation of the *Midsummer Night's Dream* is a task of singular difficulty. The delicate fanciful scenes of fairyland run from their very nature a great risk of losing their spiritual beauty by being transferred from the immortal freshness of the poet's mind to the gross and palpable aspect of mortality. To translate the court of Titania and Oberon to the reality of human life, to interpret its moonlight fantasies by the aid of stage appliances, and yet lose no touch of its beauty, would be as difficult as to hold a butterfly in the hand and

brush no bloom from its wings. The glimpse of the fairy domain is indeed as Bottom describes it "a rare vision," and to catch such a vision and hold it before men's eyes is a hazardous attempt. Still it should be easy to give some more air, reflection of its beauty than that which has been produced at the Gaiety. The assemblage of girls in curiously devised dresses which may pass well enough for a court in a burlesque or pantomime, can hardly be accepted as the image of Titania's following. The music to which Men delsohn and some of our best English composers have set the scenes of fairyland should enhance the beauty of a poem in itself full of music. Unfortunately the vocal execution is, with rare exceptions, so bad, that the introduction of music increases rather than diminishes the displeasing effect of the performance.

It is not so difficult to represent a mortal as a fairy court upon the stage: the failure in both cases is, at the Gaiety, remarkable. It is painful to hear the words of Theseus so spoken that they lose all dignity and melody, and to find Hippolytus presented in the likeness of a queen of burlesque. As all majesty and grace is taken away from the Athenian Court, so is all feeling and interest from the Athenian lovers.

Under these conditions the humours of Bottom and his fellows, which should be an episode in the play, become its only attraction. Mr. Phelps's performance of Bottom is that of a careful and intelligent actor. His presence on the stage is a relief, inasmuch as he speaks the words of Shakspeare with distinctness and with proper emphasis. But his humour is somewhat dry. There seems to be a want of sympathy between him and his part. He makes one feel not that Bottom does not appreciate the comedy of his situation, which would be right, but that the actor representing Bottom has little consciousness of it, which is not so right. The pleasure derived from the delivery of his words is, moreover, marred by a trick of repetition and hesitation for which there seems no reason, and which is undoubtedly tiresome. This is carried to excess in the scene when Bottom wakes from his dream. Here the actor makes him repeat the words "they left me asleep," four or five times after intervals of attempted reflection and silent explanation to himself. The execution of the conceit is clever, but hardly warranted. The rebuke of Hamlet to those players who speak more than is set down for them is well known. The offence is only less in degree when the actor repeats many times the words which the author has set down to be spoken once. There is another curious point in Mr. Phelps's personation. One would think that Bottom would have sense enough to attempt a softening of his voice when he shows his companions in what a "monstrous little voice" he would speak if he might play Thisbe. Mr. Phelps, however, makes no change in his intonation when he speaks the words, "Thisbe! Thisbe! O Pyramus my lover dear! Thy Thisbe dear! and lady dear!" The small part of Flute is well played by Mr. Righton.

Of the rest of the performance there is little to be said. Whether the Lysander of Mr. Robertson or the Demetrius of Mr. Charles Creswick is the worse performance, it would be difficult to determine. Good intentions are displayed by Miss West, who plays Puck in a dress which, among many hideous dresses, is remarkable for hideousness. But a part cannot be played by intentions alone. Oberon is represented by Miss Loseby. The actress sings fairly, speaks well, and her performance is clever throughout. By contrast to its surroundings it appears sublime. Altogether, it is not too much to say that "the eye of man hath not heard, the ear of man hath not seen, man's hand is not able to taste, his tongue to conceive, nor his heart to report," a worse performance than the present one of *A Midsummer Night's Dream*.

WALTER HERRIES POLLOCK.

She Stoops to Conquer is now given nightly at the Opera Comique by a company in the main the same as that which played it once or twice in the morning at the Gaiety. Mrs. Kendal is Miss Harcastle, and Mr. Kendal young Marlowe—one of his best performances. No better young Marlowe is on the stage.

MR. HOLLINGSHEAD deserves credit for reviving *The Maid's Tragedy* of Beaumont and Fletcher—played a few days since at his third theatre, the Amphitheatre in Holborn—but though the experiment is a curious one, and interesting just because it is curious, it would have been made with greater chance of success if a stronger cast had been engaged. Mr. Ryder, of course, is exceedingly efficient in any piece of the kind, but on the first night Mr. Ryder was ill and Mr. Pennington took his place. Nor did he take it badly, though his taking it left a gap elsewhere. Miss Leighton as the heroine was distinctly overweighted. These are not parts which can be satisfactorily played by aspiring scholars in art, even when naturally much gifted. Mr. Hollingshead reminds playgoers, in his programme, that it is not so very many years ago since *The Maid's Tragedy* was performed night after night at Sadler's Wells. But Mr. Phelps was then in the great part; and though the years are not very many, the taste has changed considerably. We may continue to read the *Maid's Tragedy*, but it is doubtful whether it will long be represented.

An adaptation of *Nicholas Nickleby*, made for Mr. Chatterton by Mr. Andrew Halliday, is to be the next piece at the Adelphi. Mr. J. Clarke will perform in it. It will necessarily be interesting; and may, as one hopes, be successful. But *Nicholas Nickleby* would not seem to lend itself specially well to stage representation. It has not the pathos of *The Old Curiosity Shop*, nor the great dramatic qualities of the later books, written at a time when Dickens bestowed more thought than at first on construction, and had, too, more experience of it; and dealt with a freer hand with what is really tragical in life.

MDME. DOLARO has recovered from her indisposition, and again gives life to the performance of *La Périole* at the Royalty Theatre.

MR. T. H. FRIEND, of the Crystal Palace, was to have a benefit at the Crystal Palace Theatre on Thursday morning, when Mr. Creswick and Miss Ada Cavendish and some other well-known players were to appear in *Richard III.*

THEY have revived *Uncle Tom's Cabin* at the Adelphi, with a cast which reads as tolerably strong for a melodramatic piece, and which is actually, perhaps, stronger than it seems to be, because at least two of the representatives of important parts seem very specially suited to the characters they play. One of them—Miss Marie Henderson—illustrates with a good deal of art the way in which the Cassy of the story was the one person whom Legree feared a little. She had for him, as it will be remembered, a peculiar and compelling fascination, which his brutal strength could never shake off. Again, Miss Edith Stuart is seen quite at her best in the gentle pathos of the character of Eliza, by the performance of which she in some degree recalls her much earlier performance of the Scotch poet's wife, in Mr. Wills's *Men o' Airlie*. Mr. Sinclair plays George Harris with his usual force, and Mr. McIntyre is not wanting in the kind of vigour necessary for the representation of Legree. Miss Hudspeth is Topsy, and Mr. Howard Russell Uncle Tom. Uncle Tom is to be pitied, but he cannot expect to interest us. What interests the public at the Adelphi are the two or three strong scenes which a novel full of adventure has been able to furnish. Mr. Lloyd's scenery is good, and the appointments are careful. There is no reason why *Uncle Tom's Cabin* should fail to draw, during a few weeks, the class of playgoers for whom it is designed.

AT Drury Lane too, there has this week been a revival—the revival of Mr. Halliday's *Rebecca*: his setting of Sir Walter's *Ivanhoe*. This performance is not of a kind to satisfy those who know the story well, and care for it much; but it may give some pleasure, and render some service, to those for whom the romance of Scott is still a sealed book. And of these there are many, we suspect, among a certain class of London playgoers. The cast at Drury Lane is not in all respects as strong as when Mr. Halliday's adaptation was first produced, for Mr. Fernandez is in the place of Mr. Phelps, and Miss Geneviève Ward in that of Miss Neilson. The second change, however, is not on every ground to be regretted, and even the first has at least one point in its favour. Mr. Terriss plays Ivanhoe, and Miss Gainsborough, who at the Opera Comique appeared in far other parts, enacts Rowena. She enacts it with much intelligence, and has made great progress, it is generally admitted, since her last appearance in town, but a smaller stage will probably be found to suit her better. Mr. A. Matheson, Mr. James Johnstone, Mr. A. Glover, and Mr. H. Kendle do something to complete the cast.

MR. HINGSTON—well known for his connexion with various theatrical and literary enterprises—notably with Mr. Artemus Ward—is in bad health, and a general committee has been formed to organise a benefit for him.

MR. WALTER BENILEY made a good appearance, we are informed, as Claude Melnotte last week, in the special representation of *The Lady of Lyons* at the Alexandra Theatre; and Miss Clayton, the *débutante*, Mr. Marston's pupil, is also well spoken of. Mr. Bentley appears in Edinburgh (at the Prince's Theatre, there) on Monday next, and will then be supported by Miss Ella Dietz.

MR. BARRY SULLIVAN has just been acting Hamlet at Glasgow, finding graceful though not powerful support in the Ophelia of Miss Oghlan.

MR. JOSEPH ELDERD's excellent burlesque company—one of the strongest now anywhere to be met with—has this week been at Edinburgh, and will next week be at Plymouth. Mr. Frank Weston is its acting manager, and it includes, in addition to Mr. Eldred and some less well-known names, Mr. Edwin Danvers and Miss Rose Temple. Mr. Eldred's quaint humour is the subject of favourable criticism in the North. Mr. Danvers, who plays his original part in *Black-Eyed Susan*, plays it as well as when he was in part the cause of the great run of that funny little piece at the Royalty in Soho; and Miss Rose Temple acts Dolly Mayflower with unflagging vivacity, and sings "Within a mile o' Edinboro' Town" in a way that procures an *encore* for the old ballad in the place where the ballad is known the best and sung the best. The company plays one or other old burlesques of Mr. Burnand's, which are brighter than anything he has lately done.

THE presentation of standard English plays at the Crystal Palace, under the direction of Mr. Charles Wyndham, will be resumed on Tuesday, February 23, and continued on successive Thursdays and Tuesdays till March 16. During the series, the following plays will be performed:—Lord Lytton's *Money*, and *Lady of Lyons*; Holcroft's *Road to Ruin*; J. Mortimer's *School for Intrigue*; Shakspeare's *Romeo and Juliet*, and *Merchant of Venice*. We understand that the services of the following artists have been secured:—Miss Madge Robertson, Mrs. Stirling, Miss Carlotta Addison, Miss Fowler, Miss M. Oliver, Miss Geneviève Ward, Miss Rachel Sanger, Miss E. Duncan, Miss Carlisle, Miss Rorke, Miss Power, and Miss Ada Cavendish; Messrs. W. Creswick, Henry Neville, Herman Vezin, David James, Arthur Cecil, John Ryder, W. Kendal, Charles Warner, Charles Sugden, Charles Collette, R. H. Teesdale, R. Cathcart, H. Standing, E. F. Edgar, W. Rignold, and Charles Wyndham.

MUSIC.

CRYSTAL PALACE CONCERTS.

THE special novelty at last Saturday's Crystal Palace Concert was Franz Lachner's Suite for Orchestra in C major (No. 6), which was produced for the first time in this country. The composer, who is now in his seventy-first year, is highly esteemed on the continent, though but little known here. He is one of the large number of writers who possess every requisite except genius. The present, however, cannot be considered one of his most successful works. It consists of four movements—an introduction and fugue, exceedingly well written, and full of ingenious counterpoint; a graceful andante; a movement which Lachner calls a "gavotte," but which in reality is not a gavotte at all, but a scherzo; and a long finale, "Funeral Music and Festival March." Of these four numbers the third is decidedly the best; it is very spirited, and excellently scored for the band. It made its mark at once, and was warmly encored and repeated. The rest of the work is of inferior interest. The fugue is very Handelian in style, its subject recalling that of the overture to *Samson*; the andante is pleasing, but by no means striking; and the finale was really an infliction—the Funeral Music being tedious, and the Festival March vulgar. The whole composition shows the hand of a thoroughly experienced musician, and the workmanship is excellent; but there is not a spark of the "divine fire," while there is no plagiarism, there is also little or no individuality of style; and in spite of a very excellent performance by Mr. Mann's band, the Suite as a whole failed to make a great impression. It was curious to hear Dr. Bülow in a work so different from the school to which he is most partial as Moscheles' concerto (No. 3), in G minor. One is almost inclined to suspect that the great pianist selected this piece as a proof of his versatility, and of his mastery of all styles. Dr. Bülow is pre-eminently an exponent of the modern music of Liszt and Chopin, though, it need hardly be added, he is equally great in Bach and Beethoven. But the style of Moscheles is founded upon that of Cramer and Hummel, authors with whom it might have been expected *a priori* that the worthy Doctor would have little sympathy. The concerto selected last Saturday is generally considered the finest of the eight which Moscheles wrote; it is at all events the one which is most frequently performed both here and on the Continent. It is a very interesting without being a very great work: written strictly in the orthodox form first adopted by Mozart, it reminds one of that composer in the character of its themes, though the brilliant passages for the solo instrument are more suggestive of Hummel. The last movement is especially effective in the character of its difficulties. Dr. Bülow played the whole work with that fire and enthusiasm which invariably characterise his performances. The other orchestral pieces of the concert were the overtures to *Egmont* and *Melusina*, both too well known to need comment. The vocalists were Mdle. Johanna Levier, of whom favourable mention has more than once been made in these columns, who sang (in German) "With verdure clad," from the *Creation*, and songs by Mendelssohn and Schubert, and Mr. H. Walsham, a tenor singer, who made on this occasion his first appearance. Mr. Walsham has a very agreeable voice, and his intonation is very good; so far as can be judged from one hearing, he seems likely to be a useful addition to the ranks of our tenors.

This afternoon Mdle. Krebs will play Brahms's Concerto in D minor, and a Festival Overture by her father will be performed for the first time in this country.

EBENEZER PROUT.

THE first part of the programme of the last Monday Popular Concert was selected from the works of the late Sterndale Bennett. It opened

with his Chamber Trio in A major, Op. 26, a very pleasing and highly finished work, in which the influence of Mendelssohn is clearly to be seen, especially in the first movement, which reminds one in places of the quintett in A played a few weeks since at these concerts. A more perfect performance of the trio than that given on Monday by Mdlle. Krebs, Herr Joachim, and Signor Piatti cannot be imagined. To this trio succeeded the quartett "God is a Spirit," from the *Woman of Samaria*. This piece, as our readers will remember, was sung in Westminster Abbey at the composer's funeral. It was on the present occasion exquisitely sung by Miss Nessie Goode, Miss Bolingbroke, Mr. H. Guy, and Mr. H. Pope. An unaccompanied quartett of voices always seems to exercise a special charm over our audiences, and if well rendered is almost certain of an encore. Such was the case in the present instance; but, as not infrequently happens, it scarcely went so perfectly the second time as the first. The Bennett selection concluded with his pianoforte sonata "The Maid of Orleans." This, one of his latest, is also one of the composer's finest works, and certainly goes to disprove the assertion sometimes made that Bennett has exhausted his creative powers with his earlier compositions. It had been played only once before (by Dr. Bülow) at these concerts, on December 1, 1873. Its performance by Mdlle. Krebs last Monday was in all respects admirable; whether as regards technical perfection or intellectual appreciation of the spirit of the music, it left absolutely nothing to desire. The instrumental features of the second part were Tartini's "Trillo del Diavolo," played by Herr Joachim, and Beethoven's Quartett, in F, Op. 18, No. 1, both of which works are very familiar to the frequenters of these concerts, the former being a seventeenth, and the latter a seventh performance. Special thanks must be given to Mr. Santley for bringing forward Schubert's very beautiful song, "The Knight of Toggenburg," one of the several long ballads which the composer has set to music, not one of which, we believe, had previously been heard in this country. It is to be hoped that others, which are even finer, such as the "Erwartung," the "Viola," or the "Elysium," may ere long find their way into our concert programmes. Next Monday Brahms's great Sextett for strings, in B flat, is included in the programme, and Schumann's "Fantasiestücke" for piano, violin, and violoncello are to be performed for the first time.

The special feature of the Albert Hall Concerts has been the performances of Wilhelmj, who has fully justified his claim to rank among the greatest of modern virtuosos on his instrument. He has as yet been heard only as a soloist; it would be interesting were an opportunity afforded at the Monday Popular Concerts of judging of him also as a quartett player.

Those of our musical readers who reside in London will thank us for calling their attention to one of the special events of the season. We refer to Mr. Walter Bache's concert, which takes place at St. James's Hall next Thursday evening. Mr. Bache always takes care to provide some novelties at his annual concert, and gives such an opportunity as is seldom if ever met with elsewhere of hearing the works of the modern German school, especially those of Liszt. The present concert will be no exception; the programme will include Liszt's 13th Psalm, his Second Concerto, his Symphonic Poem "Festklänge," and three of his smaller pieces, beside works by Schubert, Weber, and Wagner. A full orchestra and chorus of about 220 performers will be engaged, and additional interest will be given to the concert by the fact that it will be conducted by Dr. Hans von Bülow.

The prospectus of the forthcoming series of concerts of the British Orchestral Society has just been issued. The novelties promised are—a Symphony in C minor by Mr. Alfred Holmes, an Andante and Scherzo by Mr. Henry Gadsby, a

Notturmo for orchestra by Mrs. Marshall, a scena "Saffo" by Signor Randegger, and overtures by Messrs. J. L. Hatton and T. Wingham. The first concert is to be given on March 10, and the programme will consist entirely of works by the late Sir Sterndale Bennett.

THE annual Musical Festival at Edinburgh in connexion with the Chair of Music in the University founded by General Reid took place on the 13th and 15th inst. Professor Oakeley had, as in previous years, engaged Mr. Charles Hallé and his excellent orchestra from Manchester. The programmes of the three concerts, which have been forwarded to us, are most admirable, but too long to quote entire: the following summary will, however, prove how excellently Professor Oakeley caters for his public. Among the chief works performed are:—Symphonies—Mozart in D, Beethoven in D, No. 2, Schubert in C, No. 9; Overtures—*Der Freischütz*, *Athalie*, *Leonora No. 1*, *Medea*, *Genoveva*, *Vestale* (Spontini), *Richard III.* (Volkman), *Hamlet* (Gade), *Rienzi* (Wagner), pianoforte concertos and solos by Mr. Hallé, violin solos by Mdlle. Norman-Néruda, various miscellaneous orchestral pieces, among others Liszt's "Les Préludes," and two of Brahms's "Hungarian Dances," and vocal music by Miss Edith Wynne and Mr. Edward Lloyd.

AN interesting discovery has just been made in Germany of a specimen of a now obsolete instrument, the *oboe d'amore*, which Sebastian Bach so frequently uses in his compositions. The instrument is now in the possession of a collector, M. Mahillon, at Brussels, and is in excellent preservation, only slight repairs being needed to render it playable.

A NEW history of ancient music, by F. A. Gevaert, is about to be published by the firm of Messrs. Schott in Brussels. The work will be in French, and in two volumes, the first of which is announced to appear during the present month.

RUBINSTEIN is at present in Berlin, and announces a concert to take place to-morrow (the 21st) at which his new symphony and his new pianoforte concerto are to be produced.

THE sale by auction of the stock of music plates and copyrights of Messrs. Hopwood and Crew, just concluded by Messrs. Puttick and Simpson, of Leicester Square, is remarkable for the large prices obtained. Among the more prominent may be cited:—Lots (44), Blamphin's *Dreaming of Angels*, 63l. 16s. (Brewer); (61), the same composer's *Just touch the Harp gently*, 113l. 15s. (ditto); (81), *Pretty Swallow*, also by Blamphin, 69l. (J. Williams); (168), Signor Campana's *Speak to me*, 110l. (Chappell); (175), *The Scout*, by the same composer—this song (rendered famous by the singing of Mr. Santley), after a spirited competition, fell to Mr. Morley, Jun., at the large sum of 312l. Lot (201), Clifton (II.), *As welcome as the flowers in May*, 72l. (Metzler); (224), ditto, *It's really very singular*, 82l. 10s. (ditto); (258), Coote (C.), *Archery Galop*, 96l. (Ashdown & Parry); (260), ditto, *Awfully Jolly Waltz*, 94l. 10s. (ditto); (271), ditto, *Burlesque Valse*, 175l. 10s. (ditto); 238, *The Cornflower Valse*, 132l. (ditto); (361), Clifton (II.), *Pulling hard against the Stream*, 67l. 10s. (J. Williams); (364), ditto, *Robinson Crusoe* 132l. (ditto); (398), (ditto), *Where there's a Will there's a Way*, 61l. 10s. (J. Williams); (407), *Wait for the Turn of the Tide*, 75l. (ditto); (509), Hobson's *Come sing to me*, 83l. 15s. (ditto); (510), *Complaints, or the Ills of Life*, by the same composer, 85l. 10s. (ditto); (527), Howard (R.), *You'll never miss the Water till the Well runs dry*, 165l. (B. Williams); (579), Coote's *Just Out Galop*, 73l. 12s. (Chappell); (625), ditto, *Pretty Bird Valse*, 66l. 6s. (ditto); (631), Ditto, *Prince Imperial Galop*. This lot was knocked down to Mr. J. Williams for 990l., the largest price we believe ever obtained for a single piece of dance music. Lot (655), Coote's *Sweetly Pretty Valse*, 245l.

(Chappell); (660), Hobson's *Popular Favourites for the Pianoforte*, 412l. 10s. (ditto); (682), Buckley's *Come where the Moonbeams linger*, 157l. 10s. (ditto); (684), Clifton (II.), *Very Suspicious*, 330l. (J. Williams); (953), *The Snow-drift Galop*, 561l., purchased by Mr. Coote; (974), *Coote and Tinney's Ball-Room Album*, 110l. (Chappell); (1,152), Thomas (J. R.), *The Birds will Come again*, 153l. (J. Williams); (1,325), Robert Coote's *Ball-Room Guide*, 150l. (Willey). Total, nearly 15,000l.

POSTSCRIPT.

THE Annual Report of the Director of the National Gallery for 1874 has just been issued. The only additions by purchase during the year were fourteen pictures from the Barker collection, the cost of which was 10,395l. They include: *Madonna and Infant Christ*, by Antonio Vivarini; *Madonna in Prayer*, by Cosimo Tura; *The Madonna in Ecstasy*, *St. Catherine*, and *Mary Magdalene*, by Carlo Crivelli; *The Nativity*, by Piero della Francesca; *Madonna and Child*, by Benvenuto da Siena; *The Triumph of Chastity*, by Luca Signorelli; *The Return of Ulysses to Penelope*, and *The Story of Griselda*, in three compositions, by Bernardino Pinturicchio; *Mars and Venus*, and *Venus Reclining*, by Sandro Botticelli. A portrait of Cardinal Fleury, the great Minister of Louis XV., by Hyacinthe Rigaud (sometimes called the Vandyke of France), has been presented by Mrs. Charles Fox. Three pictures by the late Thomas Sword Good, of Berwick-on-Tweed, entitled *No News*, *A Fisherman with a Gun*, and *A Study of a Boy*, were bequeathed by his widow; and Roelandt Savery's *Orpheus charming Birds and Beasts with the Music of his Lyre*, was bequeathed by Mr. S. James Ainslie. The most favourite subjects for copyists were, among the foreign or old masters, Rubens's *Chapeau de Paille* and Cuypp's *Ruined Castle*, each of which was copied six times; while Landseer was by far the most highly honoured in that way among the moderns, *King Charles's Spaniels* having been copied no fewer than twenty times, and several others by the same artist from ten to twelve times. The daily average attendance at Trafalgar Square was 4,291; in 1873 it was 4,410.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Isaac Casaubon. By Mark Pattison, Rector of Lincoln College. (London: Longmans & Co., 1875.)

THE name upon the title-page of this book is sufficient warranty for its excellence in all that concerns accuracy, scholarlike finish of style, and sound judgment. Mr. Pattison has chosen for his hero a student whose biography offers little that is superficially interesting, but whose prominent place in the history of learning, whose relations with the universities of Geneva and Montpellier, when these were still centres of European culture, and whose sojourn at the courts of Henri IV. and James I. supply innumerable topics for minute and learned illustration. English students have not unfrequently been attracted by the lives of the great scholars of the Renaissance; but neither Greswell's *Memoirs of Politian*, nor Shepherd's *Life of Poggio*, nor indeed any of the numerous biographies of Erasmus, offers a history so copious in details and so masterly in treatment as this monograph upon the life and times of Isaac Casaubon. Casaubon is brought before us not merely as the successful professor and the patient student, who was wont to complain of his friends as "*amici studiorum meorum inimici*," and who would write, after a day of sixteen hours' continual reading, "*hodie vixi*;" he also appears as a Huguenot, subject to the persecutions of the French Catholics and to the wily blandishments of the Parisian Jesuits, at a critical moment of the Reformation period, when a man of his enormous erudition was regarded as a tower of strength, and fought for accordingly by each of the great parties who then divided the religious and political world. Mr. Pattison has successfully defended his character from the charge of "wavering," which even the judicious Hallam brought against him; and not the least interesting chapter of the biography is that devoted to the ten years spent by Casaubon in Paris, a Huguenot staunch to his conviction, holding office as King's reader and librarian at a Catholic court, and tempted by all that a scholar holds dear to abjure his faith. The contrast between Casaubon, abiding by his Protestant belief, in spite of discomfort and cajolment, and Winckelmann, who made himself an abbé in order that he might see Rome and live among Greek statues, occurs to our mind. But want of consistency, pardonable in Winckelmann during the careless eighteenth century, would have been a crime in Casaubon, whose parents had suffered for their creed, and whose youth at

Geneva had been passed amid the miseries of religious warfare. Besides, Winckelmann was, through and through, an artist: this justified him in obeying an aesthetic law of life; whereas Casaubon, as Mr. Pattison has shown with much acuteness, was essentially a man of double soul. The one half of him was a Humanist, bent on absorbing the whole of Greek and Latin erudition, so as to reconstitute the form of classic culture. The other half was a Theologian, absorbed in patristic studies, whose spiritual life depended on a close personal relation to the God of his worship. One-third of his voluminous diary, continued without intermission from the year 1597, when he was thirty-eight, to the year 1614, when he died, consists, says Mr. Pattison, of pious ejaculations and petitions. The rest contains, for the most part, the record of his daily reading, interspersed with lamentations over the shortness of life, the waste of time in frivolous engagements, and the numerous interruptions to his studies. On the public events which were taking place around him, he made but brief comments in his diary, which seems to contain little that is valuable or characteristic for the illustration of the agitated period in which he lived. It is, indeed, difficult to avoid reflecting that the bookworm existence of this great scholar was exceeding dreary. He rose early and retired late to rest; and through the long hours of the day he did nothing to his own satisfaction but read. Physical weaknesses of various sorts oppressed him. The cares of his family—for he was twice married, and his second wife had eighteen children, most of whom were sickly—reduced him to nerveless despondency. His friends were tedious, for they took him from his books. The duties of a courtier provoked from his pen prayers which have almost the force of curses. In the King's presence he was always thinking of his library; and that "last page of the *Observations upon Athenæus*" kept haunting him in the pauses of agreeable conversation. A dreadful sense of the shortness of time pursued Casaubon like a nightmare. We might imagine him pale-faced and sorrowful (as he appears in his Bodleian portrait) bending for ever over an open folio, with Death shaking an hour-glass above his shoulder. The legend that he used to pour vinegar into his eyes to keep himself from sleeping, is, like many legends, only a picturesque exaggeration of the truth. To make the biography of such a student really vivid or seductive to the general reader would have been impossible; yet Mr. Pattison has done as much as could be hoped for in this direction. His not unfrequent indulgence in caustic and drily humorous remarks gives pungency and flavour to the record of an existence itself deficient in any kind of brilliant quality. At the same time, the amount of original information respecting the universities of Geneva, Montpellier, and Paris, the state of the book market, eminent men of letters and the world, and the whole relation of the European races to culture in the sixteenth century, which is lavished in this volume, gives it a value quite irrespective of its delineation of the character of its hero.

The life of Isaac Casaubon divides itself into four clearly marked periods. He was born at Geneva in 1559; and the first period, which extends from that date until 1596, embraces his education at the Genevese Academy, and his subsequent professorship in the same university. Here he married his two wives, the second of whom was Florence, daughter of the great printer and Greek scholar, Henricus Stephanus, second of that name. From 1596 to 1599 Casaubon resided at Montpellier, where he professed the humanities, lecturing to large classes, chiefly upon Latin authors. This portion of his life has been admirably illustrated by Mr. Pattison with observations upon the state of culture in Europe during the period. The contempt entertained by the high nobility of France for classic study, the merely theological and practical bias of the English, and the suspicion with which the Roman court regarded learning, are contrasted with the zeal for scholarship in Casaubon, the brilliant accomplishments of Scaliger, and the refined cultivation of De Thou's society in Paris. It was at Montpellier in 1597 that Casaubon began to write his *Animadversions on Athenæus*, a work which with singular contrariety of temper he always regarded as slavery, "*catenati in ergastulo labores*," but which remains as the chief monument of his scholarship. In 1600 he removed to Paris, on the invitation of Henry IV., who indulged a dream of rehabilitating the University. The competition of the Jesuits, the incompetence of the professorial staff, and the religious difficulties of the moment, rendered this scheme incapable of realization. Casaubon found his position at Court so uncomfortable that in 1610 he abandoned Paris for London, where he entered at once into favour with King James. The prevalent tone of theological polemic in England distracted the Greek scholar from his true work of criticism; and he spent his last years in the useless refutation of the errors of Baronius. One of the most valuable chapters in Mr. Pattison's volume is devoted to the life and writings of that Catholic charlatan.

In one interesting paragraph (pp. 122-3) Mr. Pattison discusses the relation of Casaubon to the history of scholarship. He remarks that the spring-time of the Renaissance, when students were men of genius, creators, prophets, and when the scholar "gambolled in the free air of classical poetry as in an atmosphere of joy," was over. "The creative period is past, the accumulative is set in." While there is acuteness in this observation, it may be remarked that Mr. Pattison seems to forget how far more truly the fifteenth century, the age of Poggio and Aurispa and Filelfo, was one of accumulation and compilation. Into the labours of those men Casaubon had the privilege of entering. The real point about the sixteenth century is that it was the age of nascent criticism. Erasmus, Casaubon, and Scaliger were called upon to compare and weigh in balances and pronounce opinions, not merely to collect. For this, the higher work of scholarship, Casaubon was hardly qualified by nature; in the same way he was by nature unfitted to imitate Poliziano. He had neither the worldly buoy-

ancy of the Italian Renaissance nor the acute genius of an Erasmus. He remained from first to last a conscientious Protestant and a laborious reader, gifted with a powerful memory, a fair faculty of judgment, and a complete command of the two learned languages.

After laying down this volume, in which the Rector of Lincoln College has traced, with unwavering firmness and with a mental energy in every line apparent, the life of one whom Joseph Scaliger named the first Grecian of the age, and whom Grotius admired for "piety, honesty, and candour, not less remarkable than vast all-embracing erudition," there is left upon our minds a deep sense of final disappointment in the man. The work actually accomplished by this great scholar was out of all proportion to the preparations which he made. The learning he so laboriously accumulated was nearly wasted, so far as posterity is concerned. The exertions on Baronius, which killed him, are an incomplete fragment, ill-arranged, and directed against a most unworthy antagonist. The edition of Athenaeus, which he did not love, remains by far the most solid of his achievements. His work again owes nothing to its form, or his thought to its originality. Though he wrote Greek and Latin with equal facility, and though his preference for these dead languages made him use his native tongue like a peasant, yet his Latin style was commonplace and tame. It was only the soundness of his scholarship, the extent and reality of his knowledge, his modesty and paramount good-sense, that saved Casaubon from being a mere Dryasdust; in the same way his manliness of bearing and the solidity of his character prevent our regarding him as the pedantic and querulous book-worm which the *Ephemerides* reveal. We cannot but feel that, allowing for altered circumstances and an artist's licence, George Eliot in Mr. Casaubon of *Middlemarch* has produced what might pass for a clever caricature of Isaac Casaubon. Public men may recognise themselves in the portraits, manufactured by the aid of a carte de visite and a gravy spoon, which adorn *Vanity Fair*. If Isaac Casaubon could return to life, he would grimly smile at the likeness of his own lineaments thrown back from the distorting mirror of a novelist's imagination. It may be that the frigid force of George Eliot's psychology, and the merciless use made of Casaubon's name in that analysis of an abortive life of study, preoccupy the attention unduly and divert the judgment. Yet even if Casaubon's patronymic occurs by accident in *Middlemarch*, it is not improbable that an association, deriving its sting from George Eliot's genius, will continue for a while to prejudice the minds of many against a man who, judged by the intellectual standards of his century, was worthy of all respect. Which will last the longer and prevail—Isaac Casaubon, or Dorothea's husband? That is a matter for even betting. *Habent sua fata libelli.*

J. A. SYMONDS.

DR. ALBRECHT WEBER, of Berlin, has just been elected by the Council an honorary member of the Royal Society of Literature.

Statement exhibiting the Moral and Material Progress and Condition of India during the Year 1872-73. By Clements R. Markham. Ordered by the House of Commons to be printed, June 2, 1874.

(First Notice.)

As far as the happiness of the human race is dependent on its material prosperity and the beneficent intention of its rulers, the student of history would probably turn to the epoch of the Roman Empire under its good Emperors as the golden age of the world. The correspondence of Trajan and Pliny survives to exhibit the spirit of the Roman rule over its dependencies in its best days, and affords a delightful picture of a philanthropic ruler of a province consulting with the irresponsible master of the world on every detail of administration affecting the welfare of the people. The construction of an aqueduct, the repairs of a public bath, the drainage of an inland sea, the remedy for a polluted river, with questions that concern the rights of the Emperor and the privileges of the subjects, are disposed of by Trajan in a spirit that commands our admiration for his common sense and our respect for his innate justice. The Empire of India, which has fallen to England almost despite its own wishes, certainly without any premeditated design of conquest, is the largest that has ever been held as a foreign dependency since the golden days of Rome; and, whatever may have been their mistakes and shortcomings, it may be fairly said that her rulers have been actuated by the spirit of a Trajan.

In the papers whose title heads this article, Mr. Markham has produced a compendious account of what has been effected to the present time, especially in the material progress of the country. The subject is not generally interesting. India is the dinner-bell of the House of Commons, and unless roused by the news of a rebellion or a famine, Englishmen are content to take on trust the fact that their countrymen in the East are not neglecting their duty, while the fondness of Anglo-Indian writers for unknown terms and Oriental technicalities adds to the general distaste for a discussion of Indian topics. To those readers of the ACADEMY who may not be deterred by this feeling, I have to thank the Editor for an opportunity of presenting a summary of the results of our Indian rule, though to do so in a brief article is like cutting a map of the world upon a cherry-stone.

The keystone of the subject is Finance. England could not afford to govern India if the latter did not pay its own expenses, and the real difficulty of the problem to be solved by her rulers is to curtail philanthropic expenditure within due bounds, and not to purchase material improvements at the cost of a deficiency in the yearly Budget, or the odious alternative of the necessary imposition of taxes foreign to the spirit of the people. Most fortunately for the prosperity of our rule, the mainstay of Indian Finance, the Land Revenue, amounting to 21,000,000*l.*, is no tax at all, but the rental of the land received either in whole or part by the Government which in England belongs to private proprietors. Nine millions more

are raised on opium, as a contribution from the Chinese consumers of the drug. Six millions are raised on salt by a real tax on the people, which is paid without a murmur, having been levied from time immemorial by every ruler of the country. Customs and excise, the next most important items, are indirect forms of taxation that never yet have created discontent; stamps, as at present collected, are little more than a fair fee for the cost of law and justice; and the income tax, the most unpopular tax ever levied in India, has for the present ceased, I trust not to be re-imposed except on some such vital need as that which compelled its introduction.

The taxation of a foreign dependency is a question of peculiar difficulty, where the taxpayers have no voice in the matter; and it is the duty of alien rulers to avoid every novelty, and especially all direct forms of taxation. It is better to sin against every law of political economy rather than to rouse a rebellion; it is better to levy objectionable custom duties, in preference to alienating the wealthy classes by an income tax; it is better to forego material improvements rather than to incur debt, hamper the finances, and draw on the possibilities of the future for the liabilities of the present.

There is a school of Indian reformers who advocate the treatment of India as an encumbered and neglected estate, on which an energetic owner may spend any amount of capital, with the certainty of obtaining an enormous profit upon any outlay. When the finances of India were on a less satisfactory footing than they are at present, every quack was ready with his nostrum to cure the unfortunate patient, and the believers in hydropathy were the loudest in their assertions, and possibly the most earnest in their belief in the efficacy of their professed cure. Only spend enough money on irrigation and water communication, cried these enthusiasts, and all money difficulties will soon cease. Three hundred per cent. was talked of as a moderate return for capital spent on irrigation works, and the cheap transit of heavy goods by water was to increase a hundredfold the productive powers of the country. Sir Arthur Cotton, the author of several most successful irrigation works, of which any engineer might be justly proud, was the great apostle of this school, and carried his enthusiasm so far as to inveigh against the construction of railways as utterly unsuitable to India, and as a lamentable waste of money, diverting so much capital from irrigation works.

"Prudens futuri temporis exitum
Caliginosa nocte premit Deus:
Ridetque si mortalis ultra
Fas trepidat."

The main system of Indian railways, according to this most able man so utterly unsuited to the country, was, at the date of Mr. Markham's report, nearly completed. Calcutta, Multan, Bombay, and Madras are connected by first-class lines—5,872 miles are open; their construction has cost a little upwards of a hundred millions, having been probably carried out in a needlessly expensive fashion, and on the system of guaranteed interest, which, though perhaps unavoidable at first, was attended with the greatest cost. In

of these errors, these magnificent—the mightiest boon that English nation has bestowed on India—cast a revenue a charge for guaranteed income of less than $1\frac{1}{2}$ per cent. on their cost, a fair prospect of their receipts covering their expenditure in course of time. Had this anticipation not been realised, the net gain to the Government, and the loss given to every producing interest in the country, is cheaply purchased at the price.

The section of Mr. Markham's paper on irrigation is evidently drawn up by an enthusiast; but it contains materials by which any careful reader can check the somewhat unguarded statements of the commission on this subject. The fallacy into which advocates of enormous irrigation works as a panacea for every evil in India fell, and which is endorsed by Mr. Markham, is that the necessity is in proportion to the want of rainfall in the different tracts of country. It may sound like a paradox, but experience shows that such is essentially not the case.

On the east coast of Madras, with a rainfall from 50 to 60 inches a year, irrigation is absolutely necessary, because the poverty of the soil renders what is called in India dry cultivation unprofitable. In the Ceded Districts of the same presidency, with a yearly rainfall not exceeding 30 inches, the rich soil of the plains requires only moderate showers at certain seasons to produce an abundant harvest. The whole mode of cultivation in these tracts is totally different from that of rice, and more resembles the European system of agriculture. Here the farmers have been accustomed for generations to grow in rotation crops of various kinds of cereals, pulses, hemp, cotton, and oil seeds.

They use heavy cattle in their ploughs, in which they take as much pride as an English farmer in a fine team of horses. Offer them an unlimited supply of water for irrigation, and they do not know what to do with it. To introduce rice cultivation they would have to change all their system as completely as would be necessary for a Norfolk corn grower to do if you turned his fields into water meadows. They must get rid of their heavy ploughing cattle, and buy wading boots to wade in the swamps; above all, they must make a large outlay of capital about to make their fields fit for the new mode of agriculture. One peasant with an oxen plough, helped by his own family, can arm profitably ten acres of dry cultivation; he cannot cultivate more than two acres of rice. It is idle to expect a complete and immediate revolution in the agriculture of the district, because it has pleased the Government to construct a huge work of irrigation. As a fact, that under such circumstances, in India, the sudden bestowal of an unlimited supply of water may be looked upon as a boon, but for a time as a positive evil.

Lord Salisbury, in his recent speech at Manchester, treated this matter with his common sense, and Mr. Markham's statement contains facts that amply bear out the truth of his strictures.

It is impossible to exaggerate the blessing derived from suitable irrigation works in suitable localities. The most remunerative are always the restoration of old works of this

kind that have fallen into decay. A better example can hardly be adduced than the work performed by Major Minchin, in the native state of Bhawalpur. He assumed charge of the country in 1867, during the minority of the Nawab, when it had a nominal revenue of 120,000*l.* a-year, chiefly levied in grain. He borrowed 15,000*l.*, and commencing with that sum, restored those ruined canals which were most easily taken in hand, developing his schemes of restoration from the profits of the undertaking. In this way, within four years, he raised the revenue of the state to 190,000*l.* paid in cash, and converted the lawless, half-starving population of an almost desert tract into a thriving agricultural community. (*Statement*, pp. 52-3.)

It is impossible to gather from Mr. Markham's paper any definite account of the sums spent by the Indian Government on irrigation works, or generally the profit on each. The largest of such works in existence, the Ganges Canal, gave a net profit of not quite 74,000*l.* in the year 1872-3, or 2.75 per cent. on the capital sunk. This work, therefore, as a pecuniary speculation, is less profitable than the railways. The canals in the North West Provinces represent about the same capital, and return a profit of 3.46 per cent. In the Madras presidency alone do there appear to be extensive works of irrigation that can be considered largely remunerative. Such, unquestionably, were the improvement of native works on the Kaveri and Koleru, carried out by Sir A. Cotton, and the original ones in the Godavari Delta, on which he may fairly rest his fame as a benefactor to mankind. No trustworthy data exist on which the money profit of these works can be fairly estimated, and Mr. Markham wisely avoids entering on this much disputed question. The Delta works on the Kistna and Ponnair rivers in the Madras presidency are equally useful, but not so profitable, pecuniarily, as the above.

The complete failure of the great works constructed at Midnapur and Orissa in Bengal, and Kurnool in Madras, as honestly detailed in Mr. Markham's paper, shows the absurdity of offering vast stores of water to people who do not want it, and the lamentable waste of money that can be effected in the operation.

The Orissa scheme is peculiarly instructive. It was designed to save the province from the recurrence of famine, and was taken up in 1862 by private enterprise, on unguaranteed capital, and, I trust, on purely philanthropic principles. The chief engineer was a favourite assistant of Sir A. Cotton on the Godavari, and, as usual with that school, framed an estimate for the works not half sufficient for the purpose. In 1868 the company had spent all their money, and the Government came to their rescue by purchasing their works for upwards of a million. In 1871-72 these works, which it had been anticipated would finally irrigate one and a half million of acres, did irrigate 14,740. But, as Mr. Markham quotes:—

"The assessments were disputed at every step, and howling mobs followed the canal officials representing their grievances. There is indeed a story that the ryots were charged for water-rates when banks burst, and the inundation damaged

their crops. Demand after demand had to be abandoned, and finally the net income in Orissa on account of irrigation for 1871-72 was only 1,772*l.*" (*Statement*, p. 67.)

The story of the Kurnool scheme in the Madras presidency is little different. This was a favourite project of Sir A. Cotton's to divert the water of the Toongabudra river through the Kurnool district into the Pennair valley, to irrigate a great portion of the Bellary district, and to construct reservoirs in the higher portions of the Toongaboodra, to feed the river and canals during the cold season, and make them navigable to the sea. For this purpose a company was formed in 1860, with a capital of one million, to which the Government, as in the case of railway construction, guaranteed to pay interest of 5 per cent. It is needless to dwell on all the details of this failure. After 600,000*l.* had been spent in addition to the guaranteed million, the main canal and works for the Kurnool district alone were supposed to have been completed by July 1871. In the year 1872-73, about eleven thousand acres were irrigated, for which 5,000*l.* water rate was paid. The town of Kurnool was also supplied with water during the hot months. As a counterpoise to these advantages, much valuable land was submerged by the peculiar construction of the canal with a single bank for the sake of economy, creating huge lakes on the lower levels, the whole of which land under agreement the Government had to make over to the company without cost, having to purchase the same from the owners. The gross receipts from the canal in 1872-73 were 9,750*l.*, the expenditure, 21,197*l.*, so that although the loss is not so large as on the Orissa scheme, the result must be a terrible disappointment to the believers in the large profits universally obtainable from irrigation works.

For thirteen years Government has paid the guaranteed interest on the capital million of this company, and must continue to do so until it buys back their works; add the sums spent on this project, and in Orissa to the cost of the Ganges Canal, and of those in the Upper Provinces, and compare them with what has been spent up to this period on the whole railways of India. As a mere pecuniary speculation the latter are the more successful, and it is doubtful to any but fanatics on the subject whether huge schemes of irrigation can ever be made to pay.

Paradoxical as it seems in a country where the rivers are dry for some months in every year, the water prophets declared that not only irrigation, but water communications, were the remedy for every evil in India. Sir Arthur Cotton can advance any quantity of statistics to support this theory, but the facts are against him. Except in the rainy tracts in Bengal, and along the western coast, all attempts to keep canals open throughout the year have proved illusory, and a vast scheme for making the Godavari river navigable, after ten years' persevering efforts and an enormous expenditure, which Mr. Markham does not state exactly, but which must have exceeded a million, was finally abandoned as impracticable with any reasonable outlay.

JAMES INNES MINCHIN.

Lives of English Popular Leaders in the Middle Ages—Tyler, Ball, and Oldcastle.
By C. Edmund Maurice. (London: Henry S. King & Co., 1875.)

THE volume before us is the second of a work on English popular leaders in the Middle Ages, and it treats of three such characters belonging to nearly the same epoch. With regard to the two first, the author confesses that materials fail him for a life of either; but if the book in this respect is not quite what it professes to be, there is a unity in the contents of the present volume which three distinct biographies would not have possessed. For a study of what history says about Wat Tyler, John Ball, and Sir John Oldcastle is in the nature of things neither more nor less than a history of Lollardy and the popular movements connected with it.

It is also true, as Mr. Maurice points out, that a right treatment of these subjects involves a good deal of enquiry into the condition of the English peasantry in those days and into the history of serfdom. But we cannot think it was necessary to have devoted half the contents of the volume to a mere preliminary disquisition on these topics from the time when Pope Gregory saw British slaves for sale in the Roman market-place. Such a sketch must from the nature of the case be flimsy and imperfect; and Mr. Maurice would have done much better if he had concentrated his study a little more upon the period which he has here undertaken to illustrate. A volume quite as large could have been easily devoted to Wat Tyler's rebellion alone; and another of the same size would not have been superfluous labour on the subject of Sir John Oldcastle. We do not, however, complain that Mr. Maurice has chosen to write on a less extended scale; only, having done so, we think he ought to have confined himself, as much as possible, to the real subject of his book.

We must own, moreover, that we are not entirely satisfied in other respects with Mr. Maurice's mode of treatment. The volume is written from certain pre-conceived ideas which we cannot but think would have been considerably modified by a more careful study of original authorities. The theory that the Reformation began with Wycliffe is no doubt common enough. How far there is any truth in it we shall not attempt to discuss. But Mr. Maurice holds that the movement "really received its bent and character in the fourteenth century," and that all that Henry VIII did was to spoil it, as far as lay within his power. He is accordingly anxious to discover in the heroes of the earlier movement a strong, pure-minded love of freedom, for which their contemporaries certainly did not give them credit.

Now of course Mr. Maurice has a right to differ from his authorities on a matter of opinion like this; but he should tell us why. John Ball is regarded by all the writers of his own day as a fanatic, and his rhyming letters, which Mr. Maurice transcribes out of Knighton and Walsingham, rather go to confirm their verdict. Mr. Maurice, however, looks upon him as a great moral reformer who incurred odium and misrepresentation by attacking

the vices of the age. The only ground we can discover for this opinion is an account of his preaching given by Walsingham, in which he is said to have declared that no one was fit for the kingdom of heaven who was not born in matrimony! Mr. Maurice apparently suspects this testimony in so far as it fits the character of a fanatic, but accepts it, nevertheless, as evidence of his hero's strong desire to promote public morality. This is scarcely fair dealing with authorities. If their testimony is considered honest, even though exaggerated, still let it be taken in the sense in which it was given; if it be suspicious, let us beware of trusting it at all. But to quote a writer as evidence of the thing which he did *not* say, and which nobody else says, disregarding at the same time that which he actually does say, is against all rules of sound historical criticism.

Certainly, the high character given to Ball alike for wisdom and virtue does not seem justified by the fruits of his teaching. Mr. Maurice knows quite well that the disciples of this moral reformer, including Wat Tyler himself (whose followers Mr. Maurice commends for their orderly conduct when they first entered London), broke into the Tower, insulted the King's mother in her own chamber, and murdered the Archbishop of Canterbury and the Lord Treasurer Hales, not to mention a host of less distinguished persons. And yet, forsooth, the "popular leaders" are to be regarded as great moral reformers! Mr. Maurice in vain attempts to soften the character of these enormities by suggesting that they were exaggerated. He cannot deny the murder of Archbishop Sudbury and Sir John Hales, and he cannot find the slightest evidence that any moral reformer protested against the acts. Moreover, however exaggerated may have been the impression of those enormities, he is certainly not justified in treating with incredulity the stories of wholesale atrocities in connexion with this rebellion. The insurgents, according to Walsingham, beheaded every lawyer they could find, and dragged men out of churches and sanctuaries to behead them in the public streets. These things, which are spoken of by contemporary authorities as facts, Mr. Maurice only mentions as "rumours" which went before the insurgents in their march to London; omitting altogether to observe that the worst scenes are recorded as having taken place in London itself. He then adds—

"Most of the rumours were, no doubt, the mere inventions of the excited imaginations of the chroniclers or their informants. The orderly conduct of the army of Tyler when it was first admitted into London, and the definiteness of the demands which formed the basis of the charter granted by Richard, make the atrocities and absurdities of these acts alike improbable. Isolated acts of violence there must no doubt have been, and I shall have occasion to allude to some of them; but these vague and general charges, made by the excited enemies of the insurgents, we may fairly reject."

At this rate it is easy to set aside any testimony whatever. Among "the excited enemies of the insurgents" Mr. Maurice reckons (and, we may admit, not untruly) the poet Gower, whose curious Latin poem called "*Vox Clamantis*" was occasioned by

this rebellion. Mr. Maurice apologises in his preface for not having alluded to this work in the course of his book; but he regards it as a "strange scream" of little historical value. It would doubtless have had much more importance in his eyes if it had been a diatribe against tyranny written by one of Tyler's followers.

In short, it is only too evident that Mr. Maurice's view of this epoch of history has been formed without reference to his authorities, and that he has studied the writers of the period only to find confirmation of a preconceived idea. He has never attempted truly to weigh the testimony of contemporary writers and to form his judgment of the facts from them. He writes like a man of cultivation imbued with that laudable desire which is now so prevalent, to dip beneath the surface of history and explore its under-currents. His work, we have no doubt, was prompted by generous sympathies, and by a hatred of all forms of tyranny and oppression; but we cannot honestly say that he has shown in it the critical judgment of an historian.

Mr. Maurice will not think these remarks unfriendly. In the object of his work he has our fullest sympathy. To investigate the social condition of England in remote times is a task every way worthy of a son of Professor Maurice, who has inherited the historic taste and warm love of the people which so strongly characterised his lamented father. His book in these things does him honour; and if, as we think, his sympathies have been to some extent mistaken, we have no doubt he will himself feel, as we have done, that justice alike to him and to his subject required us to state our objections without reserve. JAMES GAIRDNER.

Poesie Albanesi. Di Girolamo de Rada. In Four Volumes. (Corigliano Calabro: Tipografia Albanese, 1873.)

THE volumes before us are at least remarkable as the first-fruits of literary culture among the Albanians. The great collections of Hahn and Camarda have introduced us to a number of old ballads, and to modern writers who had imitated them. Notable enough is one Neçim Bey, the pure-minded champion of an institution which has been daintily described as Greek chivalry, which, as of old at Sparta, is still a great social force among the Ghegs of Northern Albania. But here we have a far more ambitious attempt: compositions striving at least to mould themselves in classical forms, and instinct with a purpose at once literary and political. And, to give his work a wider field, M. de Rada has added an interpagated translation in an Italian so free—as his brother poet Tommasco, in a commendatory letter, humorously hints—from "*classical slang*" (*gergo accademico*) as to be occasionally as obscure as the Albanian text.

In the first volume, Milosao, the warrior-son of the chieftain (*despota*) of Scutari, and a daughter of his people, sing of their mutual love in a series of rhapsodies. They meet, like Jacob and Rachel, beside the well, and under the moonlight he leads her home, "tenderly pushing aside the briars which

it tear her face." From that hour their are one. His eyes seem to smile on her every star; for him the world is well so her heart be his alone. The delicacy freshness of the thoughts will be best if we give a rhapsody entire. The verse trochaic or redondilla line, of seven and t syllables, with an assonant rhyme:—

blue of heaven is reflected on the smiling face
the sea, and on the hills, the revel-grounds of
acing girls.

ads, their lovers, are watching them.

ave we on earth besides?

ave the moon at night, when the sisters of our
ang heroes gather before my door. I strike the
itar, and they, loosening their flowing trains,
ace; joy lights up every face.

fairer still, we have dreams which bring the
ed one to her lover's side. The houses are shut,
d veiled in night he waits at her door, he sits by
r side, she draws from her bosom two nuts, 'Take
am, fair youth.' And he tells her what he has
ne and where he has been, just to talk to her and
ch her. She listens, her eyes wander from star
star, fain would she stay, but she is afraid.
e, goodnight: my mother must not hear thee.'

'kiss?'

turns aside, but he draws her to him; lightly she
uns on his neck, lightly presses him to her breast.
eu! away.'

l peace go with thee.'

vatches her out of sight, and life for him that day
all one longing." (l. ix.)

hen she is his wife, "transplanted, like
olet from its bank, to pour its sweetness
ugh a palace." A son is born to them,
life is one long gala-day, till death,
ling with muffled step over the winter's
w, leaves the hero wifeless and childless.
so the great leveller rebukes man's pride
grasping—

an, who tames the horse to be his slave; who
the birds of the air that their gay plumage
deck his helm; and strips whole plains of
r leaves that worms may spin him a silken
s. Fain would he inweave in it the very sun-
ms."

freedom, instead of love, must nerve his
s, and Milosao dies as his fathers had
d, in battle against the infidels.

in the other three volumes are contained
opening cantos of a great national epic,
which M. de Rada proposes to relate, in
ne 25,000 lines, the story of the Albanian
ro and liberator, George Castriot, best
own by his Turkish title, Iskander Bey,
Scanderbeg. The poem opens at Croja,
the year 1418, with the death of Scander-
g's father, John Castriot, "the hereditary
ince of a small district of Epirus, or
bania, between the mountains and the
lriatic Sea." He dies a tributary of the
ltan, to whom he has given his sons as
stages of his fidelity, to be brought up in
e Mahometan faith. But, "through the
te which opened to receive his soul into
other world there flashed down a ray
hich bore the promise of liberty and glory
his country." Scanderbeg's two brothers
e in captivity—De Rada retains the sus-
cion of poison, as meeting better the re-
quirements of an anti-Turkish manifesto,
hich Gibbon rejected. We cannot guess
hy he himself, who was sixteen at his
ther's death, delays for twenty-five years,
uring which he serves with honour under
e Turkish flag, the effort he was pledged
o make to free his country and to claim his
rone. The twenty cantos already published
brow no light on the matter. After the

death of John Castriot they are occupied
with the details of Turkish tyranny which
called for reprisals from the Albanians, and
sowed the seeds of revolt in the land. Then
we have the episodes of the lovers Bosdar
and Serafina, Astiri and Goneta; and among
the characters who pass across the stage are
a bishop who returns from the dead, and a
witch who preaches Positivism! (iii. 27, 173).
We are forced to doubt M. de Rada's capa-
bilities for handling an epic subject, or to
shudder at the colossal proportions of his
work, when we find that some 8,000 lines of
verse are consumed and the eponymous hero
of the poem has scarcely yet made his ap-
pearance on the scene. But we shall not
wish to deny him the praise of a poet when
we look at the richness and grace of his
imagery, the nobleness of his thoughts, and
the chastened enthusiasm with which he
treats subjects so dear to him as religion
and love. Here and there, too, we get pic-
tures of Albanian life, drawn with something
of Homeric freshness—maidens busy over
an embroidered swordbelt; youths hurling
the quoit; or both together treading the
measures of some strange national dance.

However, we shall not perhaps greatly err
in thinking that it is rather as a patriot than
as a poet that M. de Rada appeals to the
literary world. In a flysheet distributed
with these volumes, he reminds his country-
men that the Albanian colonies in Calabria
offer peculiar advantages as a centre for
keeping alive the feeling of an Albanian
nationality. They have a college of their
own; their language is more assiduously
and intelligently cultivated than in Albania
itself; and the conditions of life in Italy are
more favourable to the development of a
healthy and judicious public spirit. Scan-
derbeg then is more than the hero of even
the longest epic. His name is the watch-
word of the efforts which, dying with his
death, drove a colony of fugitives to the
settlements they still inhabit on the southern
shores of Italy. The hero and the efforts
are offered again for the emulation of the
Albanians of to-day. In the motto on the
title-page of each of these volumes, Ajax
wishes for his son that in character rather
than in fate he may resemble himself; add-
ing, with a touch of sarcasm, "Yet still I
see, with envious wonder, that thou feelest
not what ills beset thee." The Skipetar, too,
must assume a grievance if he has it not.

A federal union of the provinces com-
prised in the Ottoman empire seems to the
present generation of Albanian patriots more
desirable than the isolated independence of
nationalities wanting at once in strength and
experience. We think they are right. By-
and-by, when Christian statesmen cease to
lend their countenance, for their own ends,
to the oppressions and corruption of an
infidel power, Albanians, and not Albanians
only, may reap the reward of their modera-
tion. Meanwhile let them glorify Scander-
beg as they will, so they be careful to guard
themselves from the derision and disgust
with which Europe has learned to look on
the boastful claims of another nation of
revenants—the degenerate heirs of the greater
names of Leonidas and Pericles.

C. DELAVAL COEHAM.

Shakspeare: a Critical Study of his Mind and Art. By Edward Dowden, LL.D., Pro-
fessor of English Literature in the Uni-
versity of Dublin, Vice-President of the
New Shakspeare Society. (London: Henry
S. King & Co., 1875.)

PROFESSOR DOWDEN'S study of the man Shak-
spere seems to me the best work of the kind
that has been written in our language. By
examining in chronological order what Shak-
spere worked at, the Professor goes far to
ascertain his course of mental and moral de-
velopment. To arrive at this end, he has to
ascertain the moral and ideal significance of
each play or group of plays, and this leads
him to comment on the dramas after the
manner of Gervinus and Ulrici. He is well
prepared for this by a knowledge, I suppose
unrivalled in these islands, of the body of
German criticism upon Shakspeare. This he
in turn criticises, rejecting much and adopt-
ing much, but not allowing himself to be led
astray into the formalism from which per-
haps none of the Germans is quite free,
which, instead of following the facts, devises
in advance a system to control the facts,
and often reduces the vital heart of one of
the great dramas to an aesthetic maxim, or
an idea, or a fragment of political philosophy.
Seeking to know the development of Shak-
spere's mind and heart, and not to make a
catalogue of his ideas and opinions, he looks
at each play not as a storehouse of such
opinions, but as the expression of Shakspeare's
profound sympathy with an individual soul
in its inward conflicts, and with a personal
life in its struggles against external pressure.
A man is known by his friends; and the
great characters which Shakspeare succes-
sively created were the children of his own
heart and brain.

Professor Dowden's method is this: first,
by a wide generalisation, he finds the general
character of the Elizabethan age, so as to
give a first vague outline of the poet, by de-
scribing the soil on which he grew, and the
atmosphere which surrounded him. From his
era the Professor shows that he had the gift
of devotion to fact, and that he then slowly
and deliberately worked out his mastery
over fact. Coldly copying from models, dis-
passionately amassing details in his two long
poems, experimenting in different directions,
not perhaps in *Titus Andronicus*, but cer-
tainly in *Henry VI.*, *The Two Gentlemen of*
Verona, *Love's Labours Lost*, and the *Comedy*
of Errors, Shakspeare by degrees acquired a
sure handling of his matter. In the two
early tragedies over which he long brooded
and laboured, the Professor discerns his
struggles against passion and idealism—the
Romeo and the Hamlet in his nature. All
this time he was tightening his hold of fact
by his realistic studies in the historical plays.
In *Henry V.* the Professor sees the ideal
which the poet admired; in Romeo and
Hamlet the passion and the idealism which
prevented him from making that imperfect
ideal his own. After having thus attained
by his struggles an equilibrium in his own
nature, there came a period of rest and en-
joyment, which is mirrored in his great
comedies. Then came the protest of this
perfected nature against the world as shown
in his tragedies and the Roman plays; and

lastly, the idyllic peace of the country-gentleman in his retirement, as shown in *Cymbeline*, the *Winter's Tale*, and *Prospero*; where the magician having fully educated and developed his wondrous art (Miranda), delivers her over to Ferdinand (Fletcher) to tend and to preserve. All this Professor Dowden works out with much detail, and with many happy combinations. The main outline agrees essentially with the sketch of Mr. Farnivall in his introduction to the new edition of Gervinus.

Professor Dowden's whole subject is one full of difficulties, and incapable of strict demonstration. Mr. Halliwell exhorts us all to avoid the temptation of endeavouring to decipher Shakspeare's inner life and character through the media of his works. According to previous bias, so will be the reader's assent to the conclusions of this book. But some parts are manifestly better founded than others; and the weakest of all the parts I consider to be the first chapter, where Professor Dowden commits the manifest fallacy of getting out of a generalisation more than he puts into it. It is only after abstracting all particulars, after generalising the characteristics of the whole European movement, that the characteristic of the Renaissance is defined, in contrast with that of the Middle Ages, to be "a rich feeling for positive concrete fact." The Spanish seekers after El Dorado, the Italian Michel Angelo, the French Montaigne, the English Shakspeare and Bacon, must all figure in the induction which leads up to this conclusion. The conclusion itself contains no special characteristic, national, religious, or political. All such have been abstracted in order to arrive at the generalisation. And yet Professor Dowden uses the abstract conclusion to answer for Shakspeare's relation to the special currents of his time: he must have been of such or such persuasion, "unless he had stood in antagonism to his time." That is to say, an abstract proposition arrived at by finding a common characteristic of all the movements of Shakspeare's day, is afterwards used to determine which of those movements was favoured by the poet himself. This is the feat of a conjuror, who gets whatever the spectator asks for out of an empty hat, but not the reasoning of a logician. Dr. Dowden, I fancy, felt that his first chapter was his weak point, for it is the only chapter where he has allowed himself to write absurdly: I do not think he will disagree with me when I characterise the end of the paragraph about Rogers, p. 33, as absurd.

When the Professor has got on with his work, and has found a solid ground of fact under his feet, then he sees to be true that which in his first chapter he assumed to be impossible—that Shakspeare was in antagonism to his age:—

"It is remarkable that Shakspeare's revolt against the world increased in energy and comprehensiveness as he advanced in years. When he was thirty or five-and-thirty years of age, he found less in the world to arouse his indignation than when he was forty" (p. 376).

That this antagonism was against some of the dominant currents of the age may be seen by his catalogue of grievances in the sixtieth Sonnet—the "limping sway" which disabled the true strength of man, the "autho-

riety" which made art tongue-tied, the "folly" which was permitted to control skill, the captaincy of ill, and the captivity of good, are all so many protests against the institutions and the course of his age.

But apart from these blemishes Professor Dowden's book merits the highest praise. The blemishes themselves are more the faults of his time than his own; they may be attributed rather to M. Taine, whose method is too evident in the first chapter, or to Dr. Vehse, whose conclusions are assumed, than to Professor Dowden. His central principle, devotion to concrete fact, may be well trusted soon to wean him from the unreal generalities which I have criticised. It would be more profitable to exhibit to us historically, if possible, Shakspeare taking his side in the conflicts of his age, than to deduce him, and construct him, from vague abstractions and empty generalities. But this fault occupies but a small place in the book, though it has taken a disproportionate share of my article. The great body of the book is built on sound induction, out of which no more is drawn than has been put into it. The New Shakspeare Society may be congratulated on having as one of its Vice-presidents so careful a student and so original a commentator on the Poet. R. SIMPSON.

Yorkshire Oddities, Incidents, and Strange Events. By S. Baring-Gould, M.A. In Two Volumes. (London: John Hodges, 1875.)

To one familiar with the stories and traditions of Yorkshire, there is, perhaps, not much new matter to be gathered from this amusing compilation. It is no slight acquisition, however, to county literature to have such biographical curiosities collected within the compass of two handy volumes; and new interest is imparted to the subject by the literary skill displayed by Mr. Baring-Gould in handling his materials. He is very happy, too, in his attempts to reproduce on paper the dialect of that part of the West Riding with which he seems best acquainted.

Among the less widely-known characters whose history has been unearthed by Mr. Baring-Gould, is Dr. John Hildrop, rector of Wath, near Ripon, about the middle of last century. He was a man of obscure birth who had worked himself up in the world by his talents and great conversational powers. The story of his presentation to the living is well worth repeating. Lord Ailesbury, the patron, surprised Hildrop with the offer of it at a time when he was regarding himself as utterly hopeless, helpless, and friendless. Amazed at such generosity, he waited upon his lordship to express all decent and grateful acknowledgments, but was roughly, though good-naturedly, cut short with, "Sir, pray spare your speeches, and keep your compliments to yourself; you are under no manner of obligation to me, for had I known a more deserving man in England than yourself, you should not have had it." Dr. Hildrop published anonymously many volumes and detached essays, little known at the present time, though some of them were clever and witty enough in their own day to be attributed to Swift. Some very good anecdotes of this gifted man are told in these pages.

Memoirs of remarkable clergymen, indeed, fill up no inconsiderable space in this enumeration of Yorkshire oddities. The living of Leaseholme, in the North Riding, was held by three successive generations of the Wikeses for upwards of a century, all of them men of great literary talents, popular preachers, eccentric in character and much given to the bottle. The first of the family who held the living was presented to it by Charles II., not for any theological attainments which he possessed, but as a reward to an old soldier of his father; for Wikes when a captain in the army of Charles I. had received a wound in his leg which incapacitated him from further active service, and no more economical method of pensioning him could be suggested. Another instance of rewarding bravery in arms by promotion in the church we have met with in the case of Samuel Drake, vicar of Pontefract after the Restoration, whose chief qualifications for the dignity of doctor of divinity appeared to be, judging by the certificates of his acquaintances, his having served in the marching army, or the garrisons of Newark and Pontefract, throughout the whole Civil War.

One of the most amusing portions of the book is the account of Jemmy Hirst, a native of Rawcliffe, who used to wear a broad-brimmed hat of lambskin, fully nine feet in circumference, a waistcoat and breeches of many colours, and yellow boots. Instead of pictures, he would hang the walls of his room with bits of old iron and coils of rope, in one place an old frying-pan, in another a rusty sword, a piece of a chair, or a jug. The eccentricities of this man having reached the ears of George the Third, the King desired to have an interview with him; the following report of the conversation which passed has been preserved. His Majesty

"asked Jemmy how he liked London. 'I like it weel enow,' answered the oddity; 'but I hadn't any idea afore yesterday and to-day there were sae many fools in it.'

"'Indeed!' said the King; 'you pay us a very poor compliment, Mr. Hirst. I did not know that we were so badly off for wisdom in London. Perhaps that is an article in such demand in Yorkshire that there is none to spare for cockneys.'

"'Why, I'll tell thee how it were,' said Jemmy. 'When I come into t' toun yesterday, and to thy house to-day, the streets were full o' crowds of folks gathered as thick as owt to see me, just a cause I happ'd to be dressed different frae other folk; and as I were waiting out yonder i' t' fore-chamber, there were one o' thy sarvants burst out laughing at me; but I reckon I spoiled his ruffled shirt for him, and punished his impertinence.'

"'One o' thy sarvants' was a noble duke in attendance, whose loss of gravity Hirst had insisted upon treating as a fit of convulsions, by dashing water in his face, pulling his nose, and using other pretended endeavours to bring him round again.

Strict historical accuracy, even in the humble matter of dates, is hardly to be looked for in such a work; unless, indeed, we are to accept some of these characters as greater natural oddities than Mr. Baring-Gould seems to be aware of himself. Among facts related of "Nancy Nicholson, the Termagant," it is hard to believe that she was born

in 1718, and died in 1854, aged sixty-nine—that she wrote a certain letter when seventy-four years old, and that important events in her career happened on February 29, 1845. An eminent pedestrian, we are informed, walked from Canterbury to London Bridge twenty-seven years before he was born; while a distinguished blind joiner had but sixty years of life, though he was born in 1808 and died in 1873. We feel the less hesitation in drawing attention to these curious facts, as they are quoted from the second edition of the book, and thus after an opportunity had been afforded the author of correcting them, if untrue.

J. J. CARTWRIGHT.

NEW NOVELS.

The Golden Shaft. By G. C. Davies. (London: R. Bentley & Son, 1875.)

Lisette's Venture. By Mrs. Russell Grey. (London: H. S. King & Co., 1875.)

Mr. Vaughan's Heir. By F. L. Benedict. (London: S. Tinsley, 1875.)

Mademoiselle Josephine's Fridays. By M. B. Edwards. (London: H. S. King & Co., 1875.)

The Old House at Alding. By E. C. C. Steinman. (London: Tinsley Brothers, 1875.)

An anecdote is told of Charles Baudelaire of which we only mean in this place to repeat the first part. When M. Baudelaire used to do occasional notes for the *Corsaire*, the editor of that periodical considered him a model contributor, for his *mots* always kept on the safe side of propriety. This reticence was due to the fact that the author had a young lady friend to whom he read his manuscript, and when he saw that she disliked a passage he suppressed it. Mr. Davies, the author of *The Golden Shaft*, would do well to get some such censor as M. Baudelaire found so useful. He has written nothing in that novel that would shock his own very free and easy heroines, but it is probable that most actual young ladies would blush themselves into an apoplexy if they heard the tale read aloud.

The Golden Shaft has the merit of straightforward, naked simplicity. It recounts the adventures of Mr. Harold Featherstonhaugh, who is a kind of low Pendennis, but more fickle and less educated than that typical youth. When first we make Mr. Featherstonhaugh's acquaintance, he is a boy of sixteen, addicted to poaching, and to sending articles to magazines. His first adventure is to meet with a lady named Jenny, who nurses him after a fall, and whom he kisses at sight. This practice he keeps up through three volumes, observing that "five girls out of ten will let you do just as you like with them." Erasmus remarked on the facility of Englishwomen in this matter, and Harold was lucky enough to live in society as easy as that which Erasmus described. The results of his love-making are rather tragic now and then, but on the whole encourage British youth to be bold, and woo in the manner of "Mr. O'Brian from Clare," in Lever's song. The descriptions of yachting, rowing, and mountain-climbing are bright and praiseworthy; but the account of the fight with a rough is

rather in a rococo style. *The Golden Shaft* is not precisely a book for girls, but it is likely to be a favourite with a not very nice sort of boys. It is also useful as a manual for persons about to make proposals of marriage. There are about five examples in the book, and we could wish that Mr. Davies would write a shilling primer on this interesting and difficult topic.

If Mr. Davies writes for boys, it is to virgins that Mrs. Russell Grey appeals. Her story of *Lisette's Venture* is full of beautiful applied morality; witness this passage, so consoling to girls who have failed in woman's highest ideal, who have not married lords,

"and very likely will be none the less happy! Well it is for us that there is a higher, an unerring Power and Wisdom to order and overrule events for us; happy indeed that our destinies, as well as the fates of those dearer to us than ourselves, are removed out of our weak hands, though it is often hard to take this thought for our comfort, when our own vain hopes and schemes are frustrated."

Hard indeed; and that girl must be unusually well brought up who turns to theology for consolation at the end of a blank season. Lisette, Mrs. Russell Grey's heroine, has hands by no means weak, and wins over an old lady who wants to prevent her marriage by getting into her house in the disguise of a lady's maid. There is much talk of the fashions, of *pepla*, and other mysteries, in *Lisette's Venture*, which will interest not only ladies, but ladies' maids, to whom we heartily recommend it.

People who like to be thrilled will find what they want in *Mr. Vaughan's Heir*. Darrel Vaughan is a charming villain, a bigamist, a forger, a thief, a member of Congress, an opium eater, and a gentleman who sells the site of his wife's mother's grave to a railway company, which drives a cutting through the sacred spot. The wife herself is a kind of Dorothea, who finds a Will Ladislav in her husband's cousin. All of them are deeply interested in wills, codicils, stolen gems, forged cheques, and a mysterious female convict called Milady, who is drawn after the manner of Mr. Bret Harte. In a different group are Nathalie, a giddy French girl, who develops into a sort of Madame de la Crèche-cassée, her elderly husband, and her mother, a repentant lady who certainly had much need of repentance. When we first meet the characters in Switzerland, the story seems full of promise, but the villains spoil it all from a natural inability to draw the line when once they have entered on their wild career. The author of *Mr. Vaughan's Heir* may write a good novel yet; his present work is not a bad specimen in its own genre.

It can scarcely be said that the author of *Kitty* has done wisely in republishing *Mademoiselle Josephine's Fridays*, with some other tales which have appeared in journals. The tales are, one may guess, early attempts, and we have made a list of solecisms, and long words used at random, which it is scarcely worth while to print, but which the curious may see on application. The novelette which gives its name to the collection, tells how four men of weak mind—an Englishman, a Scotchman, an Italian, and a Frenchman—fell in love with the same

Italian girl. In a little Sunday book of travels called *Near Home*, we read in childhood's hour that all Scotchmen wear kilts, and play the bagpipes. Knowing from personal observation that this was not so, our early doubts were awakened as to the veracity of a companion volume called *Far Off*, which described the social habits of Fiji and Thibet. In the same way, Miss Betham Edwards's Scotchman is so very unnatural, that we can't believe in her Italian, her Frenchman, or even, with the best will in the world, in her ghost, or her young bride who buys 1,500*l.* of jewellery without exciting a passing remark from her husband. Thus the book fails to please us, though perhaps people with more imagination may think it very attractive.

Conjectures are dangerous things, as Mr. Matthew Arnold said, when he guessed that his *Westminster* reviewer was the author of *Supernatural Religion*. It was not so, and we, too, may be wrong in our belief that Emma C. C. Steinman, whose name is on the title-page of *The Old House at Alding*, was the author of a wild story *Tower Hallou-deune*, which we reviewed a year ago. Both works are in blank verse with a lyric strophe here and there, as

"All was plain sailing now, how blithely went
The Master to his work: to feed, to cheer,
To soothe, to investigate the bitter past.
The Teacher's sad career." (page 40.)

After this, specimens of blank verse fall tame and flat. Why does not Miss Steinman write a poem *all* in verse? It would give her no trouble, whereas she obviously finds it impossible to confine herself to the prose which came so naturally to M. Jourdain.

A. LANG.

MINOR HISTORICAL BOOKS.

Memoir of Margaret Countess of Richmond and Derby. By the late Charles Henry Cooper, F.S.A. Edited for the two Colleges of her Foundation. (Cambridge: Deighton, Bell & Co.) This volume contains a good deal more than appears upon the title-page. The work of the late Mr. Cooper was written some years before 1840, and even that is of considerable interest, being decidedly the best biography that has yet appeared of the mother of King Henry VII. But it is only right to state that more than half the matter of the volume has been contributed by the editor, Mr. J. E. B. Mayor, of St. John's College, Cambridge, who, though he has modestly refrained from putting his own name upon the title-page, has greatly enhanced the value of the work by copious annotations and extracts from documents in an Appendix. To Mr. Mayor we are indebted for an exhaustive account of the MSS. relating to Lady Margaret at St. John's College, and for transcripts of all the hitherto unprinted matter that is of any interest. We are a little sorry that in this place he did not give us a complete text of Lady Margaret's will, which has never been fully edited, rather than a mere extract necessary to fill up the gap left by previous editors. But he has done so much to make the work complete in other things that it really seems ungenerous to complain of the one thing that does look like a slight imperfection. Besides abstracts and copies of unpublished MSS. he has availed himself to the full of all the light shed upon his subject by the most recent publications, even to the extent of reprinting from Professor Brewer's Calendar every notice of a grant or lease by Henry VIII. of the lands of his deceased grandmother. It was certainly well worth while thus to bring together all the information that could be found relating to the Lady Margaret. Not only

was she herself no ordinary woman, whose place in history is scarcely appreciated as it ought to be, but the times in which she lived are generally so obscure that collections on any subject relating to such a period are welcome. The work is made additionally valuable by an admirable glossary and a very full index.

THE ninth volume of *Cassell's Illustrated History of England* (Cassell, Petter, & Galpin), tells the story of the American civil war, and the German invasion of France in addition to the history of our own country from 1861 to 1872. The time has not yet arrived when it is possible to write a history of these stirring times in the proper sense of the word. But many will be glad to have what is as yet accessible told in a compendious form, and the author has exercised a sound discretion in allowing the personages who appear on the scene to express their opinions as far as possible in their own words.

Manufacturing Arts in Ancient Times, with special reference to Bible History. By James Napier, F.R.S.E., &c. (Hamilton, Adams & Co., 1874.) Mr. Napier some time ago published a little book called *Ancient Workers in Metal*, in which he applied his practical knowledge of metallurgy to his explanation of passages in the Bible and in ancient writers which refer to the art. He has now extended his enquiries, so as to embrace other manufactures, and this volume contains the results. The practical part of the work is admirably done, and the information is given so clearly, that it will be of considerable use to scholars. But we cannot say so much for some of the interpretations of biblical and classical passages; in fact, Mr. Napier does not profess to be a scholar, and only offers his suggestions for what they are worth. He is a little too much fascinated by enormous numbers, e.g., he reckons the gold and silver accumulated by David for the Temple as worth nearly a thousand millions sterling. He finds a difficulty in understanding how Noah navigated the Ark, and suggests that he had a great many servants, both male and female, with him. But these matters apart, his account of the metals used in antiquity, and of the methods of fusing them, is really excellent. We may especially refer to the sections on copper, tin, and bronze. It may be remarked as to the Greek word for tin, *κασσίτερος*, that the Sanskrit *kastira*, from which some would derive it, only occurs very late, and is itself probably derived from the Greek word (as is also the Arabic *khasdir*). Pictet's attempt to etymologise it as *ka-stiva*, "how malleable," has shared the same fate as his derivations from that useful prefix *ka*. Our author's remarks on Mr. Gladstone's translation of "The Shield of Achilles" are ingenious, e.g., "The word translated *trench* by him, and *pit* by others, we believe refers to the mould in which the different plates of the shield were cast; and this mould was made of bronze, and such a mould would certainly typify a dark colour (*kuano*), as such moulds when used become very dark. That bronze moulds were used in very early times has been clearly proved by such being discovered in ancient ruins."

J. F. Böhmer, *Regesta Imperii VIII. Die Regesten des Kaiserreichs unter Kaiser Karl IV., 1340-1378. Aus dem Nachlasse Johann Friedrich Böhmers herausgegeben und ergänzt.* Von Alfons Huber. I. Lieferung. (Innsbruck: Wagner.) The value of Herr Böhmer's *Regesta* is so well known that their continuation is certain to be gladly welcomed. That industrious author commenced his labours in 1831; and he has produced a work which, while indispensable to the student of the history of Germany during the Middle Ages, presents to other writers a model as yet unsurpassed. When he began his labours, he had no conception of the length to which his work would extend. A quarto volume of less than 300 pages comprised the period from Conrad I. to Henry VII.—i.e., from 911 to 1313. Two years later appeared the

Regesta Karolorum, and six years subsequently to this those of the time of Louis of Bavaria, 1314-1347. Meantime Herr Böhmer became conscious that it was necessary to institute a complete revision of his imperfect early researches. In 1844, together with the last part of his first work, he published the *Regesta* belonging to the period from the overthrow of the Hohenstaufen until the death of Henry VII., i.e., from 1246 (the date of the election of the opposition king Henry Raspe) till 1313. In 1849 he published a work on the period previous to that contained in the above volume, comprising the interval from 1198 until 1254, from the death of Henry VI. to that of Conrad IV., son of the Emperor Frederick II. Herr Böhmer devoted himself unceasingly to the progress of his work until his death in 1863, partly by completing the portions which had already appeared by means of supplements, partly by entering on the investigation of special *Regesta*, of which those relating to the house of Wittelsbach (from 1180, the date of the acquisition of the dukedom of Bavaria until 1340), were completed and published by himself, while among the papers left behind him were found materials for those of the Archbishopric of Mayence, &c., of which his successors have availed themselves.

The example given us by Herr Böhmer in this department, as well as in the publication of historical records or chronicles, was all the more fruitful because with the increasing zeal for mediæval research the mass of such materials has accumulated to a vast extent. The need of a safe guide through this wide field of original documents was apparent to all, and many similar attempts have been made with more or less success to give a chronological abstract of the essence of those innumerable records, in order to obtain a sure foundation for history. Thus Herr Chmel has devoted himself to King Rupert and the Emperor Frederick III., Herr E. Birk to the House of Habsburg until Maximilian I., Herr Erhard to the Westphalian documents, Herr Raumer to those of Brandenburg, Herr G. W. von Goez to those of the Archbishopric of Treves, &c., to which must be added the very important works of Herr T. Sickel on the Carolingians and of Herr K. F. Stumpf on the Chancellors of the German Empire. What these effected for Germany, Herr Jaffé and Herr A. Potthast (the former of whom, alas! was too soon cut off by death) undertook on behalf of the Popes: the former treated of the time from the Apostles until 1193; the latter, whose work is approaching its close, carries on the history until 1304, the eve of the translation of the Papal see to the south of France.

The work of Professor Huber is similar both in point of execution and of external appearance to his predecessor's volumes, with the single typographical difference that the notes are printed at slightly greater intervals apart, which is an advantage to the reader. Dates taken from contemporary historians and other authors are annexed to the extracts from the documents, so that we have here a connected view of existing authenticated materials for the history. The first section, which is now before us, embraces the years 1340-1354, which must always be regarded as a significant era, since the history of Charles IV. is important in relation to the later empire, not only as regards Germany, where the Imperial Constitution was definitively established, but also as regards Italy, where, after the fruitless wars of Henry VII. and Louis of Bavaria, this emperor paved the way for a state of things in accordance not with the old Imperial régime, but with the actual political condition which was henceforth to remain unaltered, and so, to some extent, secured a good understanding between the two countries.

EDITOR.

NOTES AND NEWS.

PROFESSOR MAX MÜLLER has gone to spend March and April in Italy on account of his health.

WE understand that Mr. Browning's new poem is not, as has been stated, a translation of any work of Aristophanes, but an Aristophanic poem, in which the Greek poet—or the English one in his person—says some things about himself that Mr. Browning thinks have not been said, though they want saying. The book is more than half through the press, and is expected within a fortnight.

MR. A. R. WALLACE has been at work for several years on an elaborate book about the *Geographical Distribution of Animals*, and it will be published before very long by Messrs. Macmillan. It will be in two volumes, illustrated with two general maps, and many other maps and woodcuts, all designed to meet fully the requirements of study in this increasingly important subject.

PROFESSOR HENRY MORLEY has in the press for Messrs. Cassell and Co. a companion work to his *First Sketch of English Literature*, consisting of a series of extracts from all the authors he mentions in his "First Sketch," with such further critical and other notices as he thinks necessary. The curious poverty of the standard books of extracts in the earlier part of our literature is too well known to need more than mention; and we understand that this want will be remedied in Professor Morley's new book.

WE are glad to hear that the Manuscripts of Peter Sterry, one of Cromwell's chaplains, and one of the best known mystics of his time, have been found in the hands of some descendants of his, by Mr. J. Tindal Harris, who has long been a diligent enquirer into the history of the English mystics, and has from time to time set on foot searches for additional traces of Dell, William Law, and others. Beside the MSS. mentioned in the second volume of Sterry's Works, a number of his letters have been found with them. Mr. Harris is an independent member of the Society of Friends, and lives at Englefield Green, opposite the site of Mr. Holloway's proposed College for Women. He has been long honourably known in his neighbourhood for his charity and personal kindness to the poor, by whose sick beds he is an unremitting visitor. And years ago, before building his own house, he put up near it, in his own grounds, a library and lecture-room for his poor neighbours, with dwellings for some of the aged poor whom he did not like to see end their days in the workhouse.

DR. HAKE, the author of the *Tales and Parables*, is likely to bring out another volume of poetry pretty soon. The writer has lately been in Italy, and some of the poems show that the recent direction of his mind has been partly towards the arts of form.

MISS CHRISTINA ROSSETTI will shortly bring out, through Messrs. Macmillan and Co., a collected edition of her poems, uniting together the two previous volumes, the *Goblin Market*, and *Prince's Progress*. These will be supplemented by the majority of the poems which the authoress has published in magazines, and probably by some few examples not heretofore printed. The *Prince's Progress* volume has been out of print this long while.

WE understand that Professor Stanley Jevons will contribute to the "International Scientific Series" a work entitled *Money, and the Mechanism of Exchange*. It will be a popular description of the functions of money, the substances employed at various times to make it, the actual systems of money used at present in different countries, international currency, schemes, &c.; but the author will endeavour to avoid theoretical discussions on currency questions.

WALT WHITMAN, the American poet, has published in an American newspaper his estimate of the poet Burns, in lieu of attending a Burns celebration somewhere. Whitman's opinion will be

regarded as far too lukewarm by the thorough-going enthusiasts of the ploughman-lyrist, i.e., by Scotchmen in general; nevertheless, there is a good deal of sound sense and right criterion of judgment in what Whitman says, nor does he fail to pay a willing and handsome tribute to Burns's genius, in some essential respects. What he chiefly objects to is his want of idealism. This criticism should be read by those who suppose that Whitman himself is a mere blustering realist.

WE may look for the publication in a few months of some models of light epigram and graceful fancy, which the humorous versifiers of our day would do well to study. They are the poems, early and recent, of the late Mr. Shirley Brooks. It is known that the late editor of *Punch* was a prolific master of easy and elegant *vers de société*. Many of his humorous parodies have been very famous in their day. It is proposed to collect all these scattered pieces, published originally in nearly all the chief literary journals that have appeared in England for the last twenty-five years, and to add thereto a biographical memoir of their author. It is to be desired that, apart from this work, a fuller life and correspondence of Shirley Brooks should be undertaken. The late editor of *Punch* was a famous letter-writer of a bygone type, and besides held constant communication with nearly every celebrity in wit and letters of his time.

MESSRS. CHATTO AND WINDUS will shortly publish a complete edition of the poems of Laman Blanchard. Mr. Blanchard was, it is known, the editor of the *Courier*, a constant contributor to the *New Monthly* in the days of its glory, and an intimate friend of Ainsworth, Letitia Landon, Lord Lytton, Douglas Jerrold, Browning, Dudley Costello, Marryat, and other of his famous contemporaries. His life was written by Bulwer Lytton many years ago. The poems will be preceded by a memoir from the pen of Mr. Blanchard Jerrold, his godson and son-in-law, and this will contain unpublished letters from Charles Lamb, Lord Lytton, Charles Dickens, Robert Browning, and others.

WHAT Sir Wilfrid Lawson in his "gay wisdom" has called "the holy calm" of the present parliamentary session is likely to be disturbed by the wails of a profession that has not often troubled St. Stephen's—at least with its own petitions. One of the very few authors in the House, Mr. Edward Jenkins, intends to move for the appointment of a Royal Commission to enquire into the present condition of the laws of copyright, and generally into the situation of that large class of the community which lives by literary effort. Of course, the author of *Gin's Baby* "holds a brief for his brothers," as Charles Dickens once said at a meeting held in behalf of the Literary Fund. He intends to call leading writers and publishers as witnesses of a state of things by which it is notorious the former suffer and the latter grow rich. The "rule of the trade" by which ten per cent. is invariably added to the cost of paper, printing, binding, &c., is one of the many abuses to be striven against. An extra-parliamentary committee has been formed to support Mr. Jenkins's movement. It includes the names of Tom Taylor, William Gilbert, John Hollingshead, Blanchard Jerrold, and other writers interested in the question.

MR. HENRY VAN LAUN, LL.D., the accomplished translator and editor of Taine's monumental *History of English Literature*, has in the press the first volume of a complete edition of Molière's works. Such a work has long been wanted: we wade through half-a-dozen of Molière's plays at school; but the little that is known in England of the literary history of the great French satirist would astonish the believers in the ubiquity of Brougham's Schoolmaster. Mr. van Laun's edition will include an elaborate study of the dramatist's life and times, which will embody the very latest discoveries of MM. Louis Lacour, A. Jal, and

Benjamin Fillion. The work is to be illustrated by numerous etchings by M. Lalauze, and will be completed in eight volumes.

THE *Cologne Gazette* states that the Grand-duke of Mecklenburg-Schwerin has for some time been engaged on a work on the French War of 1870-71, which will be more especially devoted to the consideration of the events in which the division commanded by himself took an active part. General von Krenski, formerly on the Grand Duke's staff, has by his desire come to Schwerin to assist in the completion of the work.

A MEETING was held on Monday last, under the presidency of Mr. Serjeant Cox, at which it was resolved to form a society for the promotion of Psychological Science, under the title of "The Psychological Society of Great Britain." T. K. Munton, Esq., was elected to be Honorary Secretary.

THE lectures on Assyrian and Egyptian Philology, which were announced in a previous number of the ACADEMY, have proved a great success. The number of students who have presented themselves has surpassed all expectation. Mr. Sayce opened the courses with an introductory address on Saturday, the 6th; and Mr. Le Page Renouf followed with two lectures on Egyptian. The second Assyrian lecture was delivered last Saturday, the 20th. It is highly gratifying that studies for which the two great English Universities can find no place should have been so cordially welcomed in London; and an assurance has been given that this country will not fall behind other nations in carrying on researches which are among the most brilliant achievements of the present century.

THE publications of the English Dialect Society, the issue of which was promised for January, have been slightly delayed. The printing of them was, however, to be completed by the end of last week, and subscribers may expect to receive them as soon as the binder can finish them. Subscriptions are now due for 1875.

A VALUABLE collection of illustrated books and manuscripts was sold by Messrs. Sotheby on the 15th and two following days. The most important piece was a manuscript in six volumes, *Antiphonarium cum Notis musicis in Usus Ecclesie Romanae*, beautifully written on vellum in very large letters with Gregorian chant, each volume gorgeously decorated with a magnificent border in which are introduced miniatures of saints and the Pallavicini arms, with 58 large initial letters, 2,114 capitals, and 45 large paintings in colours heightened with gold, attributed to Piazza assisted by Calisto di Lodi, the favourite pupil of Titian. These magnificent volumes are bound in the original oak boards, covered with leather, protected by strong brass rims, bosses and clasps. They are referred to the fifteenth or sixteenth century, and were presented to the Cathedral church of Lodi by the Marquis Pallavicini, bishop of the diocese, and were held for upwards of 300 years to be the pride of the city. They were sold for 620*l.* to Mason. The next important work in the sale was *Horologe de la Passion de Jesu Crist et Dialogue La Dame et Notre Sauveur*, a charming little manuscript on vellum, only 2½ inches by 1½, ornamented with miniatures in camaïeu, and bound in the Grolier style, the cypher of De Thou the historian being stamped in the centre. It sold for 100*l.*

Beside these were many modern works, fine editions, richly bound:—*Description de l'Egypte*, 50 *gs.*; *La Fontaine, Contes et Nouvelles*, edition of the Fermiers-Généraux, two volumes, 30*l.*; and another edition, with engravings by Oudry, 40*l.* 10*s.*; *Livre d'Heures of Anna de Bretagne*, 30*l.* 10*s.*; *Polemæi Cosmographia*, black letter, (Romæ 1478), 20*l.*; Tyndale's *New Testament*, last edition, 1536, black letter, 31*l.* The sale realised 3,382*l.*

THE New Shakspeare Society has shifted its "Scratch Night" to Friday, March 12, and will

have, as the opening paper of the evening, one by Mr. J. W. Hales on the early date of *Julius Cæsar*, contending that the play is most closely allied to *Henry V.* and *Hamlet*, and that Weever's reference to it in 1601, unearthed by Mr. Halliwell,—

"The many-headed multitude were drawn
By Brutus' speech, that Cæsar was ambitious:
When eloquent Mark Antonie had shewn
His virtues, who but Brutus then was vicious?"—

is certainly to Shakspeare's play. Dr. Brinsley Nicholson will follow, with scraps "on the probability of the misplacement of Viola's two and a half lines, 243-5, act v. sc. 1, *Twelfth Night* (Cambr. Shaksap.); on "runawayes eyes" versus "Luna's eyes," *Romeo and Juliet*, iii. 2; "A Defence of Hamlet's 'Take arms against a sea of troubles,'" an attempt to explain i. 1. 132, *Henry VI.*, "He being in the vaward, placed behind," and "Ware pensills, ho!" *Love's Labour's Lost*, v. 2. 43 (in part illustrating Shakspeare's knowledge of the practice of war). Mr. Richard Simpson will then read a short paper on "Evening Mass" in *Romeo and Juliet*, showing that a Roman Catholic might use the phrase; and then any chance scraps will be heard. Mr. Tom Taylor will take the chair.

FOR the new London Series of School and College English Text-books, Mr. J. W. Hales is to edit Shakspeare's *Cymbeline*, with lists or tables of all the metrical peculiarities of the play, glossary, notes, and an introduction not only dealing with the sources of the play, but endeavouring also to ascertain its meaning and point out its special characteristics and beauty. Indeed, we understand that an effort will be made in all the books of the London Series to avoid the charge of woodenness so often brought against other school text-books, which seem to assume that a boy or girl of sixteen or eighteen is a being to be crammed with facts and dates, and not to be helped to think or try to get at an author's spirit or meaning. "These notes are of absolutely no use for any other purpose than cramming for examination" is an exclamation that has been used of the work of an editor of great repute by more than one clever young person trying to get at the mind of the author studied and commented on.

THE reception of M. Caro at the French Academy is fixed for Thursday, March 11.

MESSRS. MACMILLAN will publish shortly *A Course of Practical Instruction in Elementary Biology*, by Professor Huxley, F.R.S., assisted by H. N. Martin, B.A., D.S.C., of Christ's College, Cambridge.

A CORRESPONDENT writes from Bath:—

"The 'unpublished letter of Coleridge' given in the ACADEMY for the 13th instant can be easily identified with Bath. 'Cheap Street' is a well-known street here, and Messrs. Binns and Goodwin had business premises there for many years as booksellers and publishers. 'Argyle Street' is in another part of Bath, but not far off.

"It is an easy journey from Bath to Calne, where Coleridge says that his address will be 'after Tuesday.'"

THE last number of the *Zeitschrift der Deutschen Morgenländischen Gesellschaft* contains the following official statement:—

"We think it right to mention that on the last day of the meeting of the German Oriental Society at Innsbruck, Professor Schlottmann read a paper on the colossal statue discovered in 1869 near the Onondaga River in North America, containing traces of a much injured Phœnician inscription. He detailed the circumstances under which the statue was discovered, examined its possible importance, and weighed the arguments for and against its genuineness. He produced several photographic views, and copies of official documents certified by American magistrates, which, as he thought, would hardly allow us to think of a forgery, unless frauds had been committed on several occasions during the judicial enquiries in the United States. A short debate on the genuineness of the inscription followed.

"This circumstance, as is well known, has led to a new and lively discussion in the country where the discovery was made, but it is to be regretted in the highest degree that Professor Schlotmann's position and the character of his paper have there been placed in a false light. We shall not enter on this matter at present beyond stating that we ought to wait for new communications which are expected from America."

THE Rev. Thomas McClatchie, of Shanghai, formerly Consular Chaplain at Hankow, has in the press a translation of the fifty-ninth section of the complete works of Choo-foo-tze (Chao Hsi), containing the system of Cosmogony. This he has illustrated with copious notes, diagrams, &c. The work will be published almost immediately.

DURING the present year there will also be published at Shanghai a volume, containing the histories of those provinces of China in which the treaty-ports are situated, that is to say, those on the sea-board and in the valley of the Yang-tze Kiang. The MSS. by the various foreign Commissioners of Customs at the open ports are already in the printer's hands. This work, which promises to be of a most valuable and exhaustive nature, will be issued from the Customs' Press at Shanghai.

PROFESSOR DE GOEJE, of Leyden, has printed some interesting *Contributions to the History of the Gipsies*. He accepts the view propounded by Pott as early as 1853 that the Gipsies are closely related to the Indian Jatt (a name which the Arabic historians transform into Zott), and to the Lûri's or musicians presented by an Indian king to the Persian monarch Behrâm Gûr (fifth century). He confirms this by numerous references to Belâdsori, Ibno'l-Athîr, Abu'l-Mahâsin, and other printed and unprinted Arabic authorities. Dr. Trumpf has already pointed out the close resemblance between the European Gipsies and the Jatt of the banks of the Indus. Professor de Goeje offers two etymologies of the name Zigeuner, which he traces either to *Sjikâri*, i. e., hunters, a name of the nomad, as opposed to the settled Jatt of Scind; or to *teanj*, a musician or dancer, the plural of which in Persian would be *tejangân*. This was properly the name of the calling of the gipsies, but in the Byzantine empire was transferred to the race. The first band of gipsies or Zotti's were deported, according to Tabari, by the Rûm, or Byzantine Greeks, in 856. So vanishes part, at least, of the mystery which inspired the freshest and most delightful of Oxford Prize Poems.

We have received *A Hebrew Grammar with Exercises*, by M. M. Kahisch, Part I., New and Revised Edition (Longmans); *Consumption and Tuberculosis, their Proximate Cause and Specific Treatment by the Hypophosphites*, by J. F. Churchill (Longmans); *Galvanic Electricity*, by J. L. Pulvermacher (Galvanic Establishment, 194 Regent Street); *Remarks and Suggestions on the Report of the Commissioners on Friendly Societies*, by G. Poulett Scrope (Ridgway); *Promotion by Merit*, by a Civil Servant (Stanford); *Die Vorreden Friedrichs des Grossen zur "Histoire de mon Temps,"* von W. Wiegand (Trübner); *Strassburg's Blüte und die Volkswirtschaftliche Revolution im 13. Jahrhundert*, von G. Schmoller (Trübner); *Einführung in die Theorie der Bevölkerungsstatistik*, von W. Lexis (Trübner); *Reinmar von Hagenau und Heinrich von Rugge*, von E. Schmidt (Trübner); *Ueber die Sanctgallischen Sprachdenkmäler bis zum Tode Karls des Grossen*, von R. Henning (Trübner); *Stray Thoughts on London*, by a Layman (Elliot Stock); *Steiger's Descriptive Catalogue of Scientific, Technological, and other Special Periodicals*, published in the United States (New York: Steiger); *The Threshold of the Unknown Region*, by Clements R. Markham, C.B., third and cheaper edition (Low & Co.); *A Whaling Cruise to Baffin's Bay and the Gulf of Boothia*, by Commander A. H. Markham, second edition (Low & Co.); *The Marvellous Country; or, Three Years in Arizona and New Mexico*, second edition (Low & Co.).

NOTES OF TRAVEL.

WE are glad to hear that influential efforts are being made to secure the appointment of a geologist to the Arctic Expedition. It appears that the mistake was made of recommending a young botanist as one of the scientific civilians, and geology remained unprovided for. Now the medical and other officers of the expedition are perfectly competent to collect all the plants of the region they discover, and to make accurate notes of their localities. It would not, therefore, be right to send out a civilian for this duty alone, as he would be taking the place of an efficient working hand. But assuredly the geological results of an exploration of the Polar region will be among the most important, and they can only be secured by a competent travelled geologist, who has paid attention to Arctic questions connected with his science. With a thoroughly efficient zoologist and collector in one ship, and a good geologist in the other, the interests of science, so far as they cannot so well be furthered by the officers of the expedition, will be fully provided for. We believe that the Duke of Argyll and other influential geologists have strongly represented the matter to the Admiralty, and that it has been re-referred to the Royal Society. We trust, therefore, that one of the most important measures for securing all the valuable results to be derived from Arctic research will now be adopted, and that a geologist will be one of the two scientific civilians in the expedition.

ARCTIC literature has received a most useful addition in the shape of a small work entitled *The Arctic Navy List; or, a Century of Arctic and Antarctic Officers, 1773-1873* (Griffin & Co.). The list is alphabetical, and gives in the shortest possible form a biographical sketch of each name, with a record of the distinctions acquired, the ships and expeditions in which the officer served, and a detailed record of all exploits performed in the Arctic regions, not forgetting the characters supported by each in the "Royal Arctic Theatre," a descent to *minutiae* which the author justifies by giving as his opinion that one of the most valuable qualifications for Arctic service is aptitude for taking part in those winter amusements which give life to the expedition during the months of forced inaction. An examination of the bead-roll will prove instructive, and points convincingly to the value of Arctic service as a school for our navy. Take such names as Back, Hooker, Franklin, Osborne and Sabine, and it is impossible to refrain from the conclusion that in their cases, and in many others, this hardy training has proved the stimulus as well as the stepping-stone to future distinctions. Nay, a greater name than these is to be found, for though he never wintered within the Arctic circle, Horatio Nelson took part in a summer cruise to Spitzbergen in H.M.S. *Carcass*, and is therefore duly recorded in these pages. The volume has appeared most opportunely, and though perhaps a little more explanatory detail might here and there enhance the interest of the lay reader, the idea of starting such a compilation deserves as much credit as the promptness with which it has been completed. Mr. Clements Markham deserves the thanks of all who take interest in our approaching Arctic Expedition for this interesting little work.

THE *Allgemeine Zeitung* states that a party, composed of University and Gymnasium Professors, will leave Munich in the spring to undertake a scientific expedition to Greece and Asia Minor. It is understood that the party will be under the special direction of Professor Christ, of the University of Munich.

THE Vienna papers announce that the captain and crew of the Russian schooner *Sojaty-Nikolai*, which took on board the members of the Austrian North-Polar Expedition, and brought them into Vardoe, have now received the marks of distinction awarded to them by the Russian Government.

To the owner and captain of the ship, Feodor Woronic, has been presented a silver medal of merit with the riband of the Order of St. Anne, while the seamen Basil Jeftinchoff and Iwan Klewin, who first caught sight of the travellers and brought them on board, have received the silver medal and riband of St. Vladimir's Order, assigned for acts of humanity, together with a sum of 50 silver roubles, which has been given to each of the crew. The Emperor of Austria has likewise shown his sense of Captain Woronic's services by decorating him with the gold cross and crown of good service, and presenting him with a purse of 1,000 florins.

AT a recent meeting of the Geographical Society of Vienna, Councillor Wex drew attention to the decrease of the water supply from rivers and springs. It appears from a reference to the necessary tables that during the last fifty years the decrease in the water-level of the Elbe and the Oder has been seventeen German inches, that of the Rhine twenty-four, of the Vistula twenty-six, and of the Danube as much as fifty-five inches, at Orsova. This sinking of the water-line of the principal rivers in Germany had been commensurate with the decrease in the water-supply from springs. The lecturer, after showing how these conditions must tend to make the German rivers unnavigable, unless some stop can be put to them, drew attention to the injurious effects produced by the present reckless system of cutting down woods, and denuding hill-sides of their natural covering, by which means all the rain and moisture is carried rapidly off the bare surface of sloping ground, instead of being attracted and arrested by leaves and branches, and carried gradually into the earth, where it serves to feed river-beds and springs. In addition to this powerful cause of the diminution of existing water-supplies, the lecturer was disposed to believe that no inconsiderable influence was exerted by the system of artificial drainage now so generally adopted by farmers, and by the draining of lakes, ponds, and other collections of water.

IN reporting upon the trade from the southern shores of the Black Sea, the principal ports through which the foreign traffic passes being Ineboli, Sansoon, Trebizond, and Batoom, Mr. Gifford Palgrave notes, as a remarkable fact, the total absence of any British trading firm or agency there. While, on an average, two-thirds of the imports consist of articles of British manufacture, and while about one-half of the exports is sent eventually to England, in not one of the four ports above-named is there a single British house, store, or shop of any kind, not even a counter behind which English is spoken, nor a single British subject or person who understands English throughout the entire length and breadth of Mr. Palgrave's consular district. It seems that in consequence of this utter absence of the English element the merchandise passes, both at the ports themselves and at Constantinople, through the hands of native traders, agents, or brokers, mostly Greek or Armenian, and is consequently "crippled, overweighted, and distorted by the commissions, extra charges, and sometimes adulterations," to which it is subject at the hands of these middlemen. Trebizond was once the centre of a great Persian trade, but a fatal blow has been dealt to it by the opening of the new and rival Perso-transit route through Russian Georgia.

NOTES OF A TOUR IN THE CYCLADES AND CRETE.

III. Crete.

AT sunset on the day after our return from Tanos (March 22) we embarked on board the Austrian steamer, which runs weekly between Syra and Crete, the Lloyd's being the only line which keeps up communication with that island. The German name of our vessel, the *Schild*, and that of her sister-steamer, the *Wien*, looked strange in

the midst of Greek and Italian titles, and sounded still more out of place in the mouths of our Greek boatmen. We were due at Khanea, the capital of the island, which lies on the northern coast, not far from its western extremity, at noon the following day, but the badness of the weather caused us to be five hours late, and gave us ample opportunity of justifying the truth of the old Greek proverb, *πολύ το Κρητικόν πύλαρος*. Late in the afternoon we passed the promontory of Acrotiri, which forms the eastern boundary of the bay of Khanea, and an hour later were lying off the port. For some time it was doubtful whether we could enter, for the narrow entrance has been so silted up, in consequence of long neglect, that the passage is often dangerous in bad weather; in this case we should have had to land at Suda, on the further side of the Acrotiri peninsula; fortunately, however, we succeeded in passing the bar. No sooner had we cast anchor than we were first surrounded and then boarded by a motley crowd of noisy Cretans in picturesque dresses, interspersed with Nubians, many of which race have been settled in the island ever since the time of Ibrahim Pasha. The appearance of the town was striking, as its irregular wooden buildings rose up the hill sides from the sea, interspersed with palm-trees, mosques, and minarets. There was no mistaking that we were once more in Turkey. The whole place is surrounded by a Venetian wall of great massiveness, and the harbour is enclosed by extensive moles. Over the sea-gate stands the Lion of St. Mark. Behind, at no great distance off, lay the mighty wall of the Sphakian mountains, deeply covered with snow, though the summits were veiled by masses of cloud.

When we landed, all our books, to our great indignation, were confiscated, and carried off for inspection to the residence of the Pasha, including Bradshaw's Railway Guide, which, no doubt, was regarded as a highly cabalistic volume. On enquiring the cause of this—for we had never been the victims of such a proceeding in Turkey before—we found that suspicion reigned supreme among the authorities, owing to the meeting of the Emperors, which had taken place shortly before, and which was supposed to bode no good to Turkey, and, in particular, to the rule of that power in Crete. Even our insignificant visit, as we found on our return from the interior, was interpreted as having a political meaning. It was discovered from our passports that I was a clergyman and my friend an officer of militia, and hence the remark was, "What can a priest and a military man want in the island if they have no political object?"

The only *locanda* in the town—a place which from its filthiness was far worse than the bare walls of a Turkish khan—bore the highly Cretan but hardly encouraging title of "The Ithadamanthys" (*ἡ Παδάμανθος*). It had, however, the advantage of nearness to the British Consulate, from the inmates of which we received very kind attention. Before coming to the island, we had often been asked whether travelling would not be dangerous there, from the wildness of the population and the general disaffection that prevailed; but our former experience of travelling in Turkey had taught us that the traveller is safest in the wildest and remotest districts, because there he is respected as a strange animal, and his value in exchange for a ransom is not known. In answer to our enquiries on this head, we were told that any stranger would be safe in every part of Crete; but that towards the English there existed such a kindly feeling that we should be especially well received: this was fully confirmed in the course of our subsequent journey. We learnt that an earthquake had been felt the night before, and that these are not uncommon here, a circumstance which they attribute to their nearness to the quiet Santorin. But the absorbing subject of interest at this time was the extraordinary severity of the season, the like of which had not been felt for forty-three years. I have already spoken of

this as being remarkable all over the south-eastern portion of the Mediterranean; but the island of Crete seemed to have been the focus of this area of cold. The distress thus caused was very great. The natives of the upland villages were escaping in great numbers over the snow, and arriving daily in Khanea; but in some cases the snow had hemmed them in too closely in their valleys to admit of their escaping, and many of them were starved in their homes. The same cause had lately brought down several of the large and rare Cretan goats, which are the representatives of an almost extinct species, from the mountain summits, to which they have now retired, and which they rarely leave. Before starting from England I had cherished a strong wish, though but a faint hope, of obtaining the skin and horns of one of these valuable ibexes; but when I mentioned this to the dragoman of the Embassy, Mr. Moates, a Greek gentleman, well known for his attention to English visitors, he at once presented me with a very fine specimen, which had been killed a few days before; this is now in the Museum at Oxford. A living specimen of the animal, which was caught and sent over, may be seen in the Zoological Gardens in London. The colour is brown, with a dark stripe down the back; the horns are long, curving gently backwards, and slightly divergent, with pointed tips. The only other places in which it is known to exist are the island of Anti-Melos, an uninhabited rock to the west of Melos, and two of the islands which run off in a chain from the extremity of Mount Pelion, viz. that called Scopelos in ancient times, and that now called Joura. In these it is very scarce, and will probably soon be extinct; but the specimens that have been brought from these places, though varying in some slight points from the Cretan goat, bear a sufficiently close resemblance to it to be regarded as the same species. Naturalists consider that it is nearest akin to the Persian goat, but far removed from that of Sinai, and the European ibexes. It was probably dispersed over all the Greek islands in ancient times, and Ludwig Ross met with an engraved stone on Melos, on which the figure of the animal, and especially its horns, are very clearly represented. From the length of the horns it seems highly probable that it was a goat of this class which, Homer tells us (*Il. iv. 105*), furnished Pandarus with a bow. Of this we are told, that it was formed of the horns of a "bounding wild goat" (*ἰζάλων αἰγῆς ἀγρίου*), which the hero had stalked and killed among the rocks; that the horns were each sixteen palms, i.e. four feet, in length; and that they were polished and fitted for a bow by a worker in horn.

Before we start for the interior, it may be well for me to say a few words as to the character of the country generally. This long and narrow island—for it is 160 miles in length, while its breadth varies from 40 to 6 miles across—is the principal link between the south of Greece and of Asia Minor, smaller stepping-stones being formed by Cythera on the one side, and by Canea, Carpathos, and Rhodes on the other. It is mountainous throughout, having a long backbone that runs through it from end to end, but its highest summits gather themselves up into three great groups—lofty enough to be clearly visible in fine weather from Santorin, which is sixty miles distant to the north. These are, the Dictæan mountains, as they were called in ancient times, towards the east; in the centre Ida, or, as it is now called, Psilorites, or the "lofty mountain" (*ὕψηλον ὄρος*); and to the west the White Mountains—*Λευκὰ ὄρη* in antiquity, now *Ἄρ-π-α βουνά*, with the same meaning—though in the interior of the country they are more commonly known as *Σφακιωτικὰ βουνά*, or the mountains of Sphakia; that being the district inhabited by the Sphakiotes, who are well known as the most warlike and independent of the modern Cretan tribes. The two last mentioned of these mountain groups rise to the height of between 7,000 and 8,000 feet above the sea. From what

we had heard and read beforehand we expected to find large parts of the island well wooded, and had pictured to ourselves such glades and dells as may be seen on the peninsula of Athos, or on the slopes of Ossa and Pelion; but here we were doomed to disappointment. Cultivated trees, indeed, may be seen abundantly, especially the olive and the orange, and the fruit of the latter is so fine, that Cretan oranges are famous throughout the Archipelago, and a great quantity is exported; but of natural vegetation there is extremely little, and the mountain uplands are for the most part bare.

On the morning after our arrival, having hired horses, and recovered our books through the dragoman of the Consulate, we left Khanea, passing through a gateway in the massive Venetian walls. The youths who accompanied our horses were two Mahometans, named Ali and Saideh, the former a Cretan, the latter a coal-black Nubian, with tattooed temples and cheeks. His history was a curious one. He had been carried off from his native country as a slave at seven years of age, and did not remember the process of tattooing, or rather gashing, by which his face had been marked, so that he could not tell us whether it was done with the knife or by firing. After this he had been sold several times to different masters, until a Turkish dignitary brought him to Crete, where he obtained his liberty. He was a fairly intelligent fellow, and very superior to his companion, Ali. He spoke Turkish and Arabic, but his ordinary language was Greek, for in Crete, alone among the provinces of Turkey, that language is spoken by all the population, whether Mahometan or Christian. This arises from the Mussulmans, with the exception of a few in the towns, being renegade Greeks, who retain their native tongue. In Thessaly, where the Greek population is very numerous, the official proclamations are in Greek, but the Mahometans, who are Turkish immigrants, speak Turkish. After ascending a little distance from the town, we found ourselves on a plain of some extent, which reaches to the foot of the Rhiza, as the lower slopes of the Sphakiote mountains are called. At the sides of the road aloes of prodigious size were growing, the leaves of some of them reaching to the height of eight or ten feet. The soil of this tract was very rich, and was covered with extensive plantations of olives, which, to judge from their size and the broken wood of their trunks, must be of great age; among these stood *konaks* or villas of Turkish grandees, surrounded with cypresses and pine-trees, and some with ruined walls. In forty minutes we reached the dilapidated village of Murnies, the decay of which was somewhat softened by the fine orange trees and other cultivation in its neighbourhood. This is a place of melancholy memories, as the scene of one of the worst of the many acts of treachery of which the Turks have been guilty in the island. As far as the circumstances can be summed up in a few sentences they were as follows. At the conclusion of the Greek War of Independence, during which the Cretans had struggled vigorously for freedom, and seemed on the point of forcing the Mahometans to leave the country, it was decided by the Allied Powers that Crete should be annexed to the dominions of Mehmet Ali, and assurances were given to the inhabitants by the British Government of the system of order which that potentate would introduce. In the summer of 1833 the Viceroy of Egypt visited the island, and immediately after his departure a proclamation was published, which tended to make a great part of the landed estates throughout the country his property. To protest against this, several thousands of the Christian population assembled at Murnies, which from its position close to the foot of the Rhiza and in the neighbourhood of the capital, has frequently been the scene of such meetings on the part of the mountaineers. After some delay, promises of redress were given, and the assembly, which had throughout been peacefully conducted, dispersed with the exception of a few hundreds. When,

however, an Egyptian squadron arrived, and the authorities felt themselves in a stronger position, they proceeded to Murnies, and arrested thirty-three of the people who had remained there, ten of whom were subsequently hanged, while at the same time, in order to strike terror into the Christians, twenty-one other persons were seized and executed in other parts of the island. Who can wonder, after this and similar atrocities, if an insurrection in Crete is almost an internecine struggle?

From Murnies we turned aside to the monastery of Hagios Eleutherios, which we found to be a small building, with a church in the Byzantine style, but without any pretension to architectural effect. The object of our search here, which had caused us to deviate from our proposed route along the north coast of the island, was a crucifix, which is mentioned by Pashley in his Travels, though he gives no description of it. Now it is well known to archaeologists that a crucifix in the Eastern Church is an object of extreme rarity, crucifixes having been traditionally proscribed just as much as statues, while icons, i.e. pictures, have been retained. Indeed, in the whole of Greece and European Turkey I only know of two others that remain; one in the monastery of Xeropotamu on Mount Athos, which is set with diamonds, and has been spared, as being a reputed gift of the Empress Pulcheria; the other, at Ochrida, in Western Macedonia, the former capital of the Bulgarian kingdom, which is regarded by its possessors as an unauthorised object, and is preserved only as a relic of antiquity, and may very possibly have descended from the times of Cyril and Methodius, the apostles of the Slavonians. On enquiry, however, we found that this crucifix is now kept at the Metochi (*μετόχιον*) or dependent monastery of Chrysospegi, and to this we proceeded, after the monks had regaled us with preserve of quince. I may remark that, though there are no remains of antiquity at Khanea except vases, *lacrimatoria*, and similar objects, which are found in tombs in the neighbourhood, yet it is tolerably certain that the ancient city of Cydonia occupied the same site, or one in the immediate vicinity; and those persons who believe in the permanence of vegetation in certain localities, and are disposed to use it as an argument for the position of an ancient site (in whose number I cannot enrol myself) may adduce in this connexion the quinces (*κινδωρία*) which grow here, as that tree is believed to have taken its name from this city. In the course of conversation with the monks I enquired about the concealed Christians—that is, Mahometans by profession who, while they conform outwardly to that creed, practise Christianity secretly; and I was told in reply that some of these remain in Crete, though their numbers are much smaller than they used to be, and that these baptize their children and observe other Christian rites in private. I had subsequent confirmation of this statement, and learnt that the greater number are to be found on the northern slopes of Mount Ida.

At Chrysospegi—which in its turn maintains that it is the original monastery, while Hagios Eleutherios is the dependency—we found in the church a handsome *iconostasis* or altar-screen of cypress-wood, light in colour, which has been elaborately carved by a native artist in 1865. Behind this the crucifix was kept, and it was produced at our request. It is about eighteen inches high, of iron, flat, and hollow, in the shape of a Greek cross, with a round iron handle at the bottom to hold it by, while each of the other three limbs bifurcates at the end into two lobes. Attached to the face of this was a crucifix of silver gilt, somewhat less than half the height of the cross, with a cross-piece bearing the superscription INBI, only the upright of the B was prolonged downwards so as to form a tail. The left foot was attached by a single nail, but the other was left free; they rested on a *scabellum*, and round the loins was a waist-cloth. Inside the cross there is something that

rattles, and this is said to be a piece of the True Cross. One of the monks described to us the miracles it had wrought, especially at the time of the insurrection—stories like those which a predecessor of his had told to Pashley, of a monk having stood with it in his hand in the thick of a battle, when bullets were whizzing round him, while he remained unhurt. Notwithstanding this, they did not show it the profound veneration with which such relics are frequently treated in Greek monasteries, and I was allowed to make a drawing of it, which I hardly expected, as many Orientals have the greatest dislike to such a proceeding, because they consider that the possessor of the likeness retains some mysterious power over the original. The monk also said that three similar ones existed in other parts of Crete, and that this one was supposed to have been a present from the Venetians: this however I doubt, for the history of such relics is seldom accurately known in the East, and Pashley was only informed that it was very ancient; besides which, it is singularly unlikely that members of the Greek Church should have accepted and preserved the symbol of a hostile creed. I have shown my drawing of it to my friends Professor Westwood and Mr. St. John Tyrwhitt, who have a right, if any one has, to pronounce on its character; but they both say that it possesses so many unusual features as to make the question a very difficult one. In fact, they find it impossible to say anything confidently about its date; and yet, unless it is an early work, it cannot be genuinely Byzantine, for a Byzantine crucifix would not have been made except at an early period. The long-tailed B is probably for a minuscule Greek β, and stands for βασιλεύς, which takes the place of the *Rex* of the Latin superscription: of this Mr. Tyrwhitt says that it is undoubtedly Byzantine. Indeed, he feels confident that the whole work is Byzantine in some sense; but not necessarily of the greatest antiquity, because after the Fourth Crusade Byzantine models were spread over Northern and Western Europe. The shape is a natural one for an ancient metal cross, because it was easy to flatten and shape out the metal.

CORRESPONDENCE.

THE ORDRE POUR LE MÉRITE.

Berlin: February 16.

The letter in the ACADEMY of February 13, signed H. Schütz-Wilson, concerning Mr. Carlyle's election as a Knight of the *Ordre pour le Mérite*, requires correction. The foreign knights are not elected according to Section V. of the Statutes, as Mr. H. Schütz-Wilson imagines, but according to Section VI., which has been amended by a later Royal order of January 24, 1846. In accordance with these, whenever there is a vacancy, the Academy of Sciences or the Academy of Arts is invited to submit to the King those candidates who have received an absolute majority of votes from the members of either Academy. These names are handed to the Chancellor of the Order, who submits them to the King. This was the procedure followed in the election of Mr. Carlyle. On December 11, 1873, his name was submitted *primo loco* to the Chancellor, Professor von Ranke, and by him to the King. An interference on the part of Prince Bismarck was out of the question, and never thought of under the circumstances.

R. LEPSIUS.

Knight of the Ordre pour le Mérite.

CAPTAIN MARRYAT A PLAGIARIST.

Old Brompton, S.W.: Feb. 23, 1875.

If "fears of the brave and follies of the wise" have a metaphysical interest for some persons, the thefts and petty larcenies of the rich should have an equal interest for others.

This excuse is offered for what I am about to call the attention of the readers of the ACADEMY to.

No one, I venture to think, has ever suspected the late Captain Marryat of having plundered other men's literary stores. Yet he has done so, in one instance at least, as unblushingly as ever did any poor author prompted by a sterile brain or an empty stomach.

Most of us have read the *Pacha of Many Tales*, a collection of stories of unequal merit, but still deservedly popular. In this collection is a tale called "The Water Carrier," which to a degree pre-eminent above the others has the true Oriental *cachet*, and, as we shall see, it ought to have it.

This tale Captain Marryat puts forward as his own production just as much as any of the others, e.g. a foolish story, undoubtedly of his own authorship, in the same batch, of a Spanish monk.

The "Water Carrier," however, is certainly not his own, for it is identical in all things but the name and profession of the hero with a genuine Eastern story published in the last century by Beloe, the translator of Herodotus. I have Beloe's story before me in a duodecimo volume, one of several entitled *Miscellanies*, consisting of poems, classical extracts, and Oriental apoloques, published by Rivingtons in 1795.

Of the Oriental portion of his "Miscellanies," Beloe in the preface to vol. iii. says:—

"I became possessed of these tales in the following manner. My friend Dr. Russell brought with him a small volume from Aleppo, from which he at different times recited to me so much that I became impatient to hear more. My importunity finally prevailed, and at various intervals his kindness induced him to dictate in the best manner he could from the Arabic, whilst I performed the humble office of scribe. . . . These tales, which it is believed never appeared before in any European language, will, I have no doubt, preserve a high place among publications of the kind, and I am satisfied that in giving them to the world I perform no useless or dishonourable office."

As Beloe's veracity seems unimpeachable, it is clear therefore from these observations of his that the tales which he has edited are genuine Arabian compositions.

I have said that Beloe's hero differs from Marryat's in his name and profession. In the one tale he is Basem the blacksmith, in the other

Yussuf the water-carrier. But this is the only difference. In all other respects the tales are the same. The *dramatis personae*, their talk, and the incidents that form the plot and the *dénouement*, are identical, and it all takes place, as may be guessed, at Bagdad.

Marryat must, under these circumstances, either have made free with Beloe's story, altering only the hero's name and trade, or he must have appropriated the same story through the aid of some other version. Which was it?

Is anything known of Beloe's friend Dr. Russell, and his volume of Arabian stories brought from Aleppo? H. C. COOTE.

IRISH TEXTS.

Trinity College, Dublin: Feb. 17, 1875.

Will you allow me to supply a strange omission in the letter of the Rev. James Graves, which appeared in the ACADEMY of last Saturday. In speaking of Irish Societies which have published, or are publishing, Celtic texts, he omitted altogether the name of the Royal Irish Academy. As Secretary of Council to that body, I think it right to state that it is doing (with the aid of a public grant) more important work of the kind in question than was ever done before, or than any other association is doing now. It is bringing out a series of lithographs from facsimile transcripts of the most ancient and valuable Celtic MSS. which this country possesses. It has already published the *Leabhar na-hUidhri*, and the first half of the *Leabhar Breac*; the former containing 134, the latter 141, double-column folio printed pages. The second part of the *Leabhar Breac* (143 pages) will soon be issued. The Academy is now preparing, and has made considerable progress with, a similar edition of the *Book of Leinster*, in the publication of which it will be assisted by Trinity College, Dublin, to which latter body that MS. belongs. As to the value of the texts which will thus be given to scholars, any one may satisfy himself by consulting O'Curry's *Manuscript Materials of Irish History*. Of the services which the publication will render to the study of Celtic and Comparative Philology, some evidence has been already afforded by the use made of the *Leabhar na-hUidhri* in Windisch's additions to the last edition of Curtius' *Grundzüge*. When I add that Mr. Whitley Stokes has in the press for the *Transactions* of the Academy the text of the *Félire of Oengus*, with translation and notes, and that the Academy has also in hand a *Corpus* of the Ogham Inscriptions, I think it will be admitted that this body is doing a great work, and one worthy of its position as the foremost archaeological—as well as scientific—Society of Ireland. JOHN K. INGRAM.

METRICAL TESTS FOR SHAKSPEARE.

Skpton: Feb. 20, 1875.

I see it announced that Professor Ingram has a new metrical test in hand, viz., the use of the short line at the end of speeches. This test I worked out fully years since, and found that it gave no additional result to what we already know. It is, in fact, involved with, though far inferior to, the stopt-line test. I have my results by me, and they are at the service of any Society that cares to print them. I look on them as worthless. I may also notice that the weak-ending test, which I worked out before Professor Ingram, but did not publish, because it gave no additional information, has in his hands given exactly the same results as the rhyme-test in mine, except for the play of *Cymbeline*, where it contradicts the clear internal evidence that this play must have been produced before *Philaster*. The apparent exception of *Pericles* arises from the Professor's having used one of the wretchedly-arranged modern editions. With the lines properly divided, the weak-ending test gives the

same results as the rhyme-test in this play also. The position assigned to it by Professor Ingram is quite untenable. See the essay of Delius on the subject. F. G. FLEAY.

"THE LIFE AND LETTERS OF THE LATE DR. ROWLAND WILLIAMS."

Shenstone Vicarage: Feb. 20, 1875.

I had much pleasure in giving deserved praise to the above book, and I also testified to the learning, the industry, and the lifelong piety of that distinguished clergyman who is the subject of it. But I did not admit that Dr. Williams was the perfect hero which his devoted wife very naturally, if not properly, supposed him to be. In return for this discriminating, but very favourable criticism, Mrs. Williams has attacked me angrily, and, therefore, unwisely. That lady I must not hope to satisfy. But if your readers are disposed to think that I did injustice to the dead, I refer them to that clause in the will of the late Vice-Principal of Lampeter which leaves a legacy to the town crier of that place. The conditions of the bequest are such as will surprise all who were not aware of the peculiarities of Dr. Williams; but they did not surprise me. For I had known him well for nineteen years at Eton and King's, and I entertained him, on his own invitation, at my house only a few weeks before his lamented death. I mention this intimacy not because I attach much importance to it on my own account, but because Mrs. Williams is of opinion that I might, with propriety, have made the observations to which she objects if I had kept up my intercourse with her husband, but not otherwise. Her insinuation that I did not read her book to the end does injustice to its merits, which are such as to secure a thorough perusal when it has been once commenced. But one does not always accept the account which a man gives of his motives; nor is the assertion that Dr. Williams would not have been satisfied with the position which I assigned him in the Temple of Fame any proof whatever that he deserved a higher niche. R. W. ESSINGTON.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, Feb. 27,	3 p.m.	Royal Institution: Professor Clifford on "The General Principles of Science."
"	"	Physical: Professor G. C. Foster and Mr. O. J. Lodge on "The Lines of Flow and Equipotential Lines in an uniformly conducting sheet;" Mr. T. Wills on "A Mode of exhibiting to a large Audience the Spectrum of Sodium."
"	"	Crystal Palace Concert (A. Holmes' <i>Jeanne d'Arc</i>).
"	"	Saturday Popular Concert, St. James's Hall.
3.45 p.m.	"	Royal Botanic.
8 p.m.	"	Royal Albert Hall, Ballad Concert.
MONDAY, March 1,	2 p.m.	Royal Institution: General Monthly Meeting.
4.30 p.m.	"	Musical Association: Mr. J. Hullah on "Musical Nomenclature;" adjourned debate on Mr. C. E. Stephens's paper on "The Fallacies of Dr. Day's Theory of Harmony."
5 p.m.	"	London Institution: Travers Course, I.
7 p.m.	"	Entomological.
8 p.m.	"	British Architects. Medical.
"	"	Medical and Chirurgical: anniversary.
"	"	Monday Popular Concert, St. James's Hall (Hallé, Joachim).
TUESDAY, March 2,	3 p.m.	Royal Institution: Mr. A. H. Garrod on "Animal Locomotion on Land, in Air, and in Water."
8 p.m.	"	Civil Engineers. Pathological.
8.30 p.m.	"	Zoological.
"	"	Biblical Archaeology: Professor R. H. Mills—"Letter on the 'Chamber of the Cow' in the Tomb of Seti I., at the Biban el

Moluk, Thebes;" Dr. L. Loewe, "Observations on a Supposed Karate Tombstone in the British Museum;" Dr. Birch on "The Inscribed Tablet in the Sepulchre of Antefas II., in the Valley of Assaf at Thebes."

WEDNESDAY, Mar. 3,	1 p.m.	Horticultural.
"	3 p.m.	Middle. Krebs's First Recital, St. James's Hall.
"	8 p.m.	Society of Arts. Microscopical. Mr. W. Coenen's First Concert, St. James's Hall.
THURSDAY, March 4,	1 p.m.	Sale at Christie's of the Works and Collection of the late Mr. Charles Lucy.
"	3 p.m.	Royal Institution: Professor Tyndall on "Electricity."
6.30 p.m.	"	Royal Society Club.
8 p.m.	"	Society of Arts: Mr. H. Blackburn on "Some Strange Aspects of Art."
"	"	Linnean. Chemical.
FRIDAY, March 5,	4 p.m.	Archaeological Institute.
"	8 p.m.	Philological: Mr. A. J. Ellis on "The Classification of English Dialects."
"	"	Geologists' Association.
"	9 p.m.	Royal Institution: Lord Rayleigh on "The Dissipation of Energy."

SCIENCE.

BRITISH BOTANY.

British Wild Flowers. By John E. Sowerby and C. Pierpoint Johnson. Parts I.—VI. (London: Van Voorst.)

The Flowering Plants of Great Britain. By Anne Pratt. Div. I. (London: Frederick Warne & Co.)

Manual of British Botany. By C. C. Babington, F.R.S., Professor of Botany in the University of Cambridge. Seventh Edition, corrected throughout. (London: Van Voorst.)

Topographical Botany. By Hewett Cottrell Watson. (Thames Ditton: Printed for private distribution only.)

The London Catalogue of British Plants. Seventh Edition. (London: Robert Hardwicke.)

British Hepaticae. By B. Carrington, M.D. Parts I.—III. (London: R. Hardwicke.)

THERE is no branch of Natural History more popular apparently than Botany. At least there seems to be none which offers greater inducement to publishers to produce a steady supply of books of a rather expensive kind. Unfortunately the demand, if tolerably constant, is not very discriminating. And although it is no doubt a satisfactory thing that there should be a distinct and healthy appetite for knowledge of a more or less scientific sort about plants, and especially about indigenous plants, it is rather unsatisfactory to find how easily it is satisfied if only the tints of the illustrations are vivid, and the nomenclature has an aspect sufficiently remote from what the majority of people think they can understand. The public not merely tolerate, but apparently seem to like a kind of sacerdotalism about such science as they spontaneously patronise. A plant is nothing without a name as unpronounceable as may be by the vulgar, just as it is necessary to a large part of the community that medicine to be efficacious should be nauseating.

If it were not for this blind faith no publisher would think it worth while to issue, as we are candidly told, for the third time (though only on the cover of the first and second parts) a work which is substantially an abridgement of one begun at the close of the last century, and completed no less than sixty years ago. Yet this is the case with Sowerby and Johnson's *British Wild Flowers*,

which is merely an abridgement of Sowerby and Smith's *English Botany*.

Of course it may be said that this is a case of *caveat emptor*. If there is a demand for a book relating to a subject by no means even yet worked out completely, and the public choose to buy one the plates of which openly bear a date sixteen years old, and profess to be copied from others published about half a century earlier, it may be said no one has a right to complain. But on the other hand, when any one interested in the British flora purchases, for the purpose of informing himself, a work which is to consist of twenty-two parts, each costing three shillings, he may reasonably expect to be spared stumbling over long-exploded errors, and to get in their place at least some of the newest possible lights. It is in no way unreasonable to look for as much as this. There is no mystery about the subject-matter; there is rather a superabundance of good and accurate books about the wild botany of the British Isles, and there is, above all, Dr. Boswell Syme's admirable *English Botany*, based, like the present one, on Smith and Sowerby's work, but with the plates thoroughly and critically revised, with many additions, and a text entirely original—a work, in fact, as thoroughly scholarly as this is the reverse. An enumeration of a few of the inaccuracies of the earlier numbers will be a sufficient example of the whole. Take the genus *Ranunculus*: two species are figured which no one now believes to be British. Both were doubtless errors. *Ranunculus alpestris* was one of Don's discoveries, and has never been verified. *R. gramineus* was a blunder for a small state of *R. Flammula*. The aquatic species are illustrated by Dr. Boswell Syme with twelve plates. Here we have three figures, one of which (fig. 13), *R. pantothrinx*, cannot nowadays be said to have any definite meaning at all. Further on we have (fig. 49) *Papaver nudicaule*, with the remark "Rocks and hills on the north-west coast of Ireland." Boswell Syme is quite right in asserting "there can be no doubt that it never grew there." Again, fig. 66 presents us with *Vella annua*, once found on Salisbury Plain, and even then doubtless a mistake for something quite different. *Cardamine bellidifolia* (fig. 98) is excluded in all the best manuals. Of minor errors there is a plentiful crop. *Arabis striata* should be *Arabis stricta*. *Sisymbrium Iris* (instead of *Iris*) is said to grow on "walls near London." We can assert with some certainty that it does nothing of the kind. *Helianthemum surrejanum* (fig. 143) is an abnormal state of *H. vulgare*; and the old confusion about the wood-violet—cleared up a quarter of a century ago—starts up again with renewed vitality. Here we meet once more *Viola sylvatica* in the double disguise of *Viola canina* and *Viola flavicornis*, being properly neither the one nor the other. No one believes now that the Mediterranean *Frankenia pulverulenta* (fig. 162) grows on the coast of Sussex, though it is admitted to be "very rare." *Stellaria scapigera* (fig. 205) may be sought for on "moist places on mountains" in vain; it is a garden variety of *S. graminea*, and was another of Don's spectral discoveries.

This is probably enough to prove the obsolete character of the book. It may be thought that after all it is of very little consequence. But as a matter of general principle it is very much the reverse. The public want good scientific information, and it is a very miserable state of things that as soon as one gets beyond the pale of books for students everything is scamped and inaccurate. One word more may be added about the introduction. Not to expend too much space on a thankless task, it will be sufficient to quote a few sentences—the italics are ours:—

"During growth, however, the walls of the cells are thickened by the gradual deposition of earthy and other substances from the liquid, and are sometimes converted in this manner into a solid mass. Growth is the formation of new cells, either by a process of subdivision and extension of those previously existing, or from the development of a minute body called a nucleus, which, formed in the cell-fluid, is afterwards extended through the membrane and becomes a cell itself." (p. xvi.)

To the instructed this will seem perhaps the most wonderful of all the odd things this book contains.

Anne Pratt's *Flowering Plants* is another serial work illustrating the British Flora. In that just noticed the figures are all brought down to the same size, with little or no regard to the scale of the plant they represent. Here the ends of compression are attained by grouping several species upon one plate without diminishing the figures from natural dimensions. The get-up of the separate parts gives no indication that this is a new issue of a not very recent book, yet there is good reason to believe that it is nothing more. Moreover, a comparison of the figures shows (as, for example, in the case of *Hutchinsia petraea* and *Teesdalia nudicaulis*, plate 15), that here again we meet the old drawings of *English Botany*, with such variations as fancy suggested to the artist who effected the transfer. Miss Pratt (we believe that is the proper appellation of the authoress) has, however, used her materials with discrimination, and her set of figures—taken for what they are—are by no means worthless, and seem to have fairly accurate names attached to them. The text is, perhaps, less valuable, and is chiefly important as showing what will still pass as a substitute for scientific literature. There are many points of view from which a good deal that is really important and deserving the attention of intelligent people may be said about plants. But it is difficult to conceive any human being really deriving benefit from Miss Pratt's flow of tepid gossip. Plants are talked about much as if they were people living in a provincial town, wearing bonnets and otherwise affording matter for tattle. Thus, of the white water-lily we are told that the Cherwell is famous for it, which suggests twelve lines of poetry; this contains the word "waves," which Miss Pratt hastens to point out should have been, except for the exigencies of the metre, "tiny wavelets;" further on, we learn that "kine refuse to eat the plant, but it is said to be readily devoured by swine." In queer juxtaposition to this it is mentioned that "the roots are chewed by singers in India to clear the voice." In Japan it is an emblem of purity; on the other hand, "the people of Greece

and Turkey make a pleasant drink from the blossoms." As a concluding and more serious word, "a variety is occasionally found with small flowers." Under the yellow water-lily we again return to pleasant drinks, with much that is curious about Turks and Arabs. If, as we are led by Miss Pratt to believe, these people make "a pleasant liquor" from the flowers of the yellow water-lily, they are quite right in using the expression "May it benefit thee" before giving it to any of their friends to drink. Under the water-cress Miss Pratt is in great perplexity. M. Vogel found

"that seeds placed in the soil perfectly free from sulphur or sulphates yielded plants which contained a notable quantity of sulphur; . . . and this chemist states that 100 gr. of water-cress seeds contained 0.129 gr. of sulphur. He adds that this is a perfect enigma to him, as the growth of the young water-cresses took place in a soil devoid of sulphur and sulphates, and in a room which contained no sulphureous vapour."

Who will solve M. Vogel's enigma!

The seventh edition of Professor Babington's *Manual of British Botany* is an additional indication of the popularity of a book the genuine merits of which are well known. No attempt is made, as in Hooker's *Students' Flora*, or Bentham's *Handbook*, by indicating the geographical distribution of each species to regard the plants of the British Isles in relation to those of the northern temperate flora generally. But British plants are taken as forming a self-contained subject of study, and their critical discrimination is pursued with a success to which all the field botanists of the country would willingly bear witness. No doubt from a biological point of view it is advisable to study the flora of a country in relation to that of other parts of the earth's surface. Nevertheless, it cannot be denied that this is a valuable mental exercise to merely discriminate as accurately as possible the members of a group of organisms such as the indigenous flowering plants of one particular country. Botany of this kind was a pursuit with which Mr. Mill occupied his leisure throughout his life. For such a purpose Professor Babington's manual is a very useful aid. A careful examination of the pages will show that all new points of information have been taken count of, and that this new edition is a good deal more than a reprint of the last. The treatment of the *Characeae* is perhaps somewhat old-fashioned. It is not easy to see what is the nature of the doubt in Professor Babington's mind when, after mentioning the structures known as globules in these plants, he adds "(anthers?)" The statement also that the nucule contains "minute granules which appear at last to unite into a single seed," is probably not actually taught in Cambridge.

Topographical Botany is privately printed, but it has been so liberally distributed among those who are interested in indigenous plants, that it may be not inexcusable to say something about it. The purpose of the book, which forms an octavo volume of 740 pages, is to give a record of every county in which each plant enumerated in floras as British has been found growing; in each case a brief memorandum of the authority for the record is attached. Mr

Watson has, in fact, printed the material laboriously collected during a rather long life, upon which he has based the various publications relating to British botanical statistics which he has from time to time brought out. At first sight it would not seem that, except in so far as accurate work in any subject carries with it, in a way, its own pleasures, so laborious an undertaking would be justified by any interesting results. It might be supposed that wild plants would be found dispersed pretty uniformly over the surface of Britain, the only difference being that some would occur at longer intervals and be rare, and others at short intervals and be common. This is not at all the case. The local distribution of plants is by no means without method; it is, in fact, an effect of various causes which have acted by no means arbitrarily. What Mr. Watson has done—and with a patience and skill altogether admirable—is to establish exactly the materials for mapping out the territory occupied by each species.

Like nations, the aggregate individuals of any one kind of plant invade, and, in a sense, make war upon each other. Such collisions result ultimately in a sort of equilibrium being reached; each species holds its own on the one hand, and is held in check on the other. To realise exactly what the *status in quo* is at a particular period is the first step towards ascertaining how it was brought about, and the right comprehension of this touches many interesting points, some in process of settling, such as the time and mode of the severance of the British Isles from the European continent, and some not settled, such as the relative ages of different specific forms.

English field botanists are very familiar with Mr. Watson's *London Catalogue of British Plants*, of which a seventh edition has recently been published. The first appears to date as far back as 1844. The list, in its present form, enumerates 1,680 species (including the higher Cryptogams). Each species has a number attached, which indicates the number of the 112 comital divisions into which Mr. Watson has divided Britain in which the species has been found. Although Mr. Watson's *Topographical Botany* is unpublished, the new edition of his catalogue gives to this extent its summarised results.

The publication of Dr. Carrington's monograph on *British Hepaticae* has been looked for during the last ten years. This interesting group of cryptogamic plants has been very little studied in this country—a somewhat curious fact, considering the interest which has always been felt for their near allies the mosses. Indeed, if we except Mr. M. C. Cooke's meritorious *Easy Guide to the Study of British Hepaticae*, published about 1865 (it bears no date), the last systematic account of the species is that contained in the supplementary volumes of Smith's *British Flora*, which is about forty years old. Besides this there was nothing for students to consult, except Gottsche, Lindenberg, and Esenbeck's *Synopsis Hepaticarum*, which, however, is itself thirty years old, and Sir William Hooker's classical *British Jungermanniae*, the plates of which will always be valuable, but which, having

been published in 1816, is now hardly to be procured.

The execution of Dr. Carrington's plates is decidedly disappointing. They no doubt are sufficiently accurate and copious in details for their purpose, but they are altogether wanting in that delicacy and finish which is, in its way, a pledge of other kinds of excellence, and is always met with in the best works on cryptogamic plants, especially those published in France. The text has, however, every indication of great critical accuracy. It is never perhaps of much importance to criticise mere terminology; all that can be demanded of a scientific term is that its connotation should be precise. The great danger in all monographs, however, is that terms will be borrowed from other subjects and used in new and confusing ways. It is decidedly to be regretted when we find the familiar term *frond* used pretty much as a synonym for stem; the *Foliose Jungermanniae* are defined as having "fronds [*i.e.* stems] clothed with distinct leaves," while further on in a subordinate group we find the character "fronds ascending rhizomatous." In plate i., fig. 1. 1, we have two objects which are called in the description "fronds natural size"; fig. 1. 2, is one of these same objects on a much larger scale, and this we are told is "fertile shoot $\times 16$ diam.," *i.e.*, magnified sixteen times in length. Now to call one and the same thing a frond when represented of natural size, and a fertile shoot when magnified, is really—if Dr. Carrington will exonerate us from any intention of disrespect—mere superfluity of naughtiness. However, this is only a criticism demanded by general principle, and there is no reason to doubt that Dr. Carrington's book will be a very sound and valuable contribution to British natural history.

W. T. THISELTON DYER.

SIR CHARLES LYELL, BART.

To sketch the life and labours of Sir Charles Lyell would be much the same thing as sketching the development of the modern school of British Geology during well-nigh half a century. The task to which he devoted his noblest energies was that of establishing the principles of Geology on a sound and philosophical basis. His leading lesson was a belief in the uniformity of the laws of nature; a belief which led him to argue that by studying the changes which are being wrought upon the surface of the earth by the silent action of forces now in operation, we put ourselves in possession of a key to the interpretation of those ancient records which it is the special business of the geologist to decipher. Sir Charles indeed developed with singular success the great truths which were first enunciated by Dr. Hutton, of Edinburgh, and eloquently illustrated by his friend Professor Playfair. Hutton died in 1797, and it is curious to note that the same year which witnessed his death gave birth to one who was destined to expound his doctrines with such force of argument as to carry them successfully against all opposition, and establish them as fundamental principles of the science.

It was on November 14, 1797, that Sir Charles Lyell was born, on his father's estate at Kinnordy, in Forfarshire. The earliest scientific observations of the young geologist appear to have been made on the rocks of his native county, since we find that his first paper, contributed in 1825 to the *Edinburgh Journal of Science*, was one "On a

Dike of Serpentine in the County of Forfar." He received his early education at Midhurst, in Sussex; and in 1818 he entered Exeter College, Oxford, where he took his M.A. in 1821. Although the advanced views of the enthusiastic geologist rendered him for many years unpopular at his University, it is satisfactory to remember that he lived to outlive this unpopularity, and that in 1855 he received the honorary degree of D.C.L. from the University of Oxford. On leaving college he came to London, where he studied for the Bar; but Dr. Buckland's lectures on Geology at Oxford had so charmed the young barrister, that on the opening of King's College, London, he accepted the Chair of Geology, and never returned to his legal studies. His labours in geological literature were commenced about this time, or even earlier, the first volume of his celebrated *Principles of Geology* having been published in 1830. So great has been the popularity of this work, that it has passed through no fewer than eleven editions; and during his last illness the venerable author was engaged upon a twelfth. The original scheme of the *Principles* was so far broken through, that a portion of the work was separated, in 1838, as an independent treatise, under the title of *The Elements of Geology*; subsequently it appeared in a modified form as a *Manual of Elementary Geology*; and at a yet later date it was condensed into a *Student's Manual of Elementary Geology*. These famous works have been translated into several Continental languages, and also enjoy an extensive circulation in America. In fact, it is a striking peculiarity of Sir Charles's writings that by their clear logic and attractive style they have gained extraordinary popularity, without in any way sacrificing their strictly scientific character.

One of Sir Charles Lyell's earliest geological researches was a revision of the classification of the Tertiary strata. He classed all the Tertiary formations in three groups, each marked by a definite relation between the percentage of recent and fossil shells. Assisted by his friend M. Dehayes, he drew up comparative tables of the mollusca in the several beds of the London and Paris basins, separating those species which were extinct from those which were identical with living forms. He was thus led to suggest the well-known grouping of all Tertiary strata into Eocene, Miocene, and Pleiocene; and although subsequent researches have shown that the "percentage test" cannot in all cases be strictly relied on, yet the soundness of the general classification is hardly open to doubt, and the names originally suggested have been imported into every geological system.

In the year 1841 Sir Charles Lyell visited America, extending his excursions from the basin of the St. Lawrence to the mouth of the Mississippi. On his return, he published his *Travels in North America*; and when, a few years later, he again visited the States, he produced an equally interesting work, entitled *A Second Visit to the United States*.

As far back as 1833, Sir Charles Lyell, in passing through Liège, examined Dr. Schmerling's collection of organic remains from the Belgian caves, and from that time the great English geologist took much interest in all researches bearing upon the earliest remains of our species. By the year 1863 the geological evidences upon this subject had become so complete, that he published his famous work on *The Antiquity of Man*.

In recognition of his valued labours in the cause of geological science, he was knighted in 1848, and created a baronet in 1864. But far above these honours we may rate those recognitions of merit which he so frequently received from his fellow-workers in the field of science. Thus he received in 1858 the Copley medal of the Royal Society, and in 1866 the Wollaston medal of the Geological Society. He was twice President of the Geological Society of London; first in 1836, and again in 1850. He presided over the

British Association at the Bath meeting in 1864.

In casting a glance over the life of Sir Charles Lyell, it will be seen that he was characterised by singular steadiness of purpose. The great doctrine of uniformitarianism which he advocated in 1830, he nobly supported to the day of his death, although modified, of course, by the progress of scientific enquiry. He made everything subordinate to his one ruling idea, that of establishing the principles of geology upon a thoroughly logical basis. Nor were his honesty and boldness less marked than his steadiness and concentration. A staunch advocate of perfect freedom of scientific opinion, he fearlessly pushed his principles to their legitimate conclusions. Having first satisfied himself of the soundness of his fundamental postulates, and employing a rigorous logic at each successive step of his reasoning, he cared but little whether his conclusions carried him; whether they chanced to fall in unison with general belief, or cut directly across the grain of popular prejudice. Toleration had been taught him by bitter experience in early life. Like most advanced thinkers, he had suffered keenly from the harsh criticisms of the narrow-minded; he had shared the fate which usually falls to

"Teachers whose minds move faster than the age,
And faster than Society's slow flight."

Perhaps the most striking characteristic of Sir Charles Lyell was his remarkable mental plasticity, a power which made him ever ready to receive new impressions and never too proud to correct his old views, or confess to a change in his previous opinions. Not that he craved for novelty merely for novelty's sake. But if he considered that fresh evidence on a given subject justified the alteration of a previously-formed opinion, he frankly turned round and renounced his old views. This was nowhere more strikingly seen than in his change of attitude towards the great question of the Origin of Species after the publication of Mr. Darwin's epoch-marking work. Whenever Sir Charles considered that a case had been fairly made out, he was too noble to shut his eyes against the evidence, but freely accepted the new conclusion, even to the overthrow of his previous work. It was the advancement of the philosophy of Geology, not the advancement of self, that he was constantly seeking. To the very last he retained this plasticity of mind; a characteristic which led him so freely, yet so cautiously, to bend before new arguments, and to stretch his old views to meet the requirements of modern research; thus strikingly unlike so many men of genius, who having developed in early life to a certain point, are content to spend the rest of their life in a state of intellectual crystallisation.

F. W. RUDLER.

SCIENCE NOTES.

PHYSICS.

The Thermal Conductivity of Liquids.—Dr. Winkelmann in the last number of *Poggendorff's Annalen* (cliii. p. 481) gives an account of investigations which he has recently made on the thermal conductivity of certain liquids, viz., water, solutions of sodium chloride, alcohol, carbon bisulphide, and glycerine. The mode of experimentation was as follows:—Two cylinders of brass were employed, of which the smaller, which served as an air thermometer, was so fixed within the larger that the perpendicular distance between the surfaces of the two was the same at all points. The space between the cylinders was filled with the liquid whose conductivity was to be investigated. Into a hole in the top of the inner cylinder was cemented a glass tube, which, passing through the upper surface of the outer cylinder, was bent twice at right angles, and dipped into a cup of mercury. The apparatus, after having been allowed to assume a uniform temperature—that of

the room—was placed in a mixture of ice and water. The mercury rose in the glass tube consequent upon the contraction of the air in the air thermometer, and the position of the top of the column was observed at fixed intervals of time by means of a kathetometer. Thus the experimental data were obtained, and from them the velocity of cooling was calculated, and thence the coefficients of thermal conductivity. Using three sets of apparatus of unequal dimensions, the author found that the velocities of cooling were very inconstant, and conceived that the irregularities might be due to inequalities of temperature on the surface of the outer cylinder. This supposition was justified by his subsequent experiments, for on agitating the mixture of ice and water by a peculiar form of annular stirrer, the inner edge of which was armed with fine brushes, and by further making a correction on account of the upper and lower surfaces which were not brushed by the stirrer, numbers were obtained agreeing very closely one with another. It is assumed that in consequence of the equal cooling of the outer vessel at all points of its surface, no convection currents arise to interfere with the conduction—passage of heat. The following numbers represent the coefficients of thermal conductivity for the corresponding liquids, a centimetre and a second being the units of length and time:—

Water	0.001540
Sodium chloride (20 per cent. of salt)	0.001912
Sodium chloride (33.3 per cent. of salt)	0.002875
Alcohol	0.001506
Carbon bisulphide	0.002003
Glycerine	0.000748

It appears from the above that solutions of sodium chloride conduct heat better than pure water, and better as the percentage of salt is greater, a result which agrees with those obtained by Dr. Guthrie. According to Lundquist and Paalzow, however, the heat-conductivity of water is not improved by the presence of salts in solution.

Does the Thermal Conductivity of Mercury vary with the Temperature?—The paper on this subject in the *Philosophical Magazine* for the present month was originally communicated by its author M. Hermann Herwig to *Poggendorff's Ann.*, vol. cli., p. 177. According to Wiedemann and Franz, the metals have equal conducting power for heat and electricity, and since we know from numerous experiments that for electric conductivity a very marked variability with the temperature takes place, it follows, if the statement of Wiedemann and Franz be true, that there will be found for the thermal conductivity of most metals a variability with temperature in about the same degree. On the other hand, Lorenz has asserted the independence of temperature of the heat-conductivity of pure metals which remain homogeneous, and accounted for the observed variations by assuming the development of thermo-electric currents in consequence of unequal heating of the metals. To decide this question it was necessary to employ a pure metal which remains homogeneous, and mercury was accordingly selected as being the only known metal satisfying the condition. Herwig's experiments show that between 40° and 160° C. the heat-conducting power of pure mercury is perfectly constant, and so far confirm the results of Lorenz. The author is occupied with the arrangement of experiments the object of which is to ascertain how far solid metals differ in their behaviour from mercury.

Mr. Baillie Hamilton's String Organ.—A short paper on the mathematical theory of this instrument is given by Mr. R. H. M. Bosanquet in the February number of the *Philosophical Magazine*. Following the method of investigation employed by the late Professor Donkin (*Donkin's Acoustics*, p. 139) Mr. Bosanquet is led to a general equation the solution of which determines what segment-

length of the string employed would, when vibrating alone, yield the same note as is actually sounded under the conditions of the instrument, i.e., when the string is attached at some point of its length to the tongue of a reed which is set in vibration by a stream of air. The solution of this equation in the general case presents great difficulty, but is effected in certain particular cases: e.g. (1) When the point of attachment of the reed is a node; (2) when the note sounded is that of the reed alone; (3) when the point of attachment is the middle of the string. Some experimental observations made by Mr. Bosanquet appeared to correspond roughly with theory, certain assumptions being made respecting the relations of the elements in the problem.

Lord Rayleigh (*Nature*, February 18, 1875) considers that Mr. Bosanquet has not touched upon the chief points of interest in connexion with this instrument. He considers that the origin of the instrument has led to misconception as to its real acoustical character. It should be regarded rather as a modified reed instrument than as a modified string instrument, although the pitch of the system is mainly dependent upon the string. Lord Rayleigh is of opinion that the vibration of the system is rigorously or approximately simple harmonic, and that accordingly the sound emitted directly from the reed or string, or from the resonance board in connexion with the string, is simple harmonic. On the other hand, it is certain that the note actually heard is compound, and capable of being resolved into several components with the aid of resonators. The explanation of this apparent contradiction is to be found in the consideration that the intermittent stream of air gives rise to a highly compound musical note, whose gravest element is the same as that of the pure note given by the string and resonance board. One effect of the string is, therefore, to intensify the gravest note of the compound sound given by the intermittent stream of air. The principal acoustical characteristic of the string—that its notes form a harmonic scale—does not come into play, the office of the string being mainly to convey the vibration of the reed itself (as distinguished from the wind) to the resonance board, and thence through the air to the ear of the observer.

These views [require confirmation by experiment.

Studies on the Magnetisation of Steel.—In the same number of the *Philosophical Magazine* is a portion of a paper by Professor E. Bouty, on the magnetisation of steel needles. An extract from the original paper, relating to a new method of determining the magnetic moment of a magnet, and especially applicable to magnets of very small dimensions, is to be found in the *Journal de Physique* (December, 1874).

The principle of this method, which is very simple, may be briefly described. Upon a rigid support of sealing wax, moveable about a vertical axis, is fixed (1) a horizontal needle, the magnetic moment (M) of which is known, and (2) at right-angles to the needle (M) and a little above it, a small glass tube into which is introduced the needle whose magnetic moment (x) it is desired to determine. The system thus formed takes, under the influence of the earth's magnetism, a determinate position of equilibrium, such that the magnetic axis of the needle (M) makes with the plane of the magnetic meridian an angle α determined by the equation $x = M \tan. \alpha$. A mirror being attached to the support which carries the needles, the angle α is read off by means of a telescope with a scale placed horizontally immediately below its object glass. With this apparatus the author was able to effect measurements relative to needles 2 millims in length and 0.2 millims in diameter.

Four distinct processes may be employed to magnetise a steel needle within a spiral of wire traversed, or capable of being traversed, by a current of electricity:—

1. The needle is introduced into the interior of the spiral while the current is passing through its coils, and extracted on the opposite side.

2. The needle is introduced, the current established, and the needle withdrawn slowly.

3. The needle is introduced, the current established and then interrupted, and then the needle withdrawn.

4. The needle is introduced slowly, the current passing; the current is interrupted and the needle withdrawn.

In each of these cases the repetition of the process furnishes an increment of magnetism to the needle, and the results of the experiments are represented with a considerable degree of accuracy

by a hyperbolic formula of the form $y = A - \frac{B}{x}$, where y represents the magnetic moment of the needle after x repetitions. $A - B$ is thus the magnetic moment acquired by the first operation, when any one of the above-mentioned processes is employed, and A the limit towards which the magnetic moment tends when the number of operations is increased indefinitely.

When the current of electricity traversing a coil is interrupted, a direct extra current is developed in the wire; when the current is established, an inverse extra current is developed. M. Bouty has found that the magnetic effects of these extra currents within the coils from which they are derived are insignificant, and in all cases may be neglected. When, however, there are two coils in the same circuit, the extra current proceeding from each is sensible in the other, but the magnetic effect of each is *nil* in the coil from which it emanates.

The Electric Conductivity of Metallic Sulphides.—Apropos of a paper which appeared recently in *Pogg. Ann.* (cliii., p. 115), and was noticed in the *ACADEMY* (Jan. 30), on the behaviour of iron and steel bars in a galvanic circuit, M. F. Braun, in *Pogg. Ann.* (cliii., p. 557), gives an account of certain curious phenomena connected with the passage of electric currents through natural and artificial metallic sulphides. The paper is intended to be preliminary, the general conditions and difficulties of the experiments, and some of the results obtained, being only recorded. The galvanic resistance of the metallic sulphides examined, whether in the crystalline form or otherwise, was found to vary with the direction, strength, and duration of the current which passed through them.

BOTANY.

THE tenth part, completing the second volume, of Dr. Reichenbach's *Xenia Orchidacea* has appeared. It contains ten partially coloured plates, illustrating about twenty new species from various regions. Among the most interesting, though not published here for the first time, is an *Apostasia* from North-east Australia. The figure of this plant was taken from a specimen in the Kew Herbarium, and the author takes the opportunity of exclaiming against the practice in this country of sticking botanical specimens down to stiff paper with glue, and the superior judgment of continental botanists in this respect. Dr. Reichenbach must know, better, perhaps, than any other continental botanist, that the following sentences are scarcely fair towards his British colleagues:—

"This [the specimen] is beautifully glued down to stiff paper. The continental botanist, who is greatly interested in so small a matter as the morphological structure of a plant, stands or sits before these magnificent specimens like the embarrassed stork of the fable, invited to dinner by the fox, before the shallow dish."

The feelings of the discriminating continental botanist are probably shared by botanists in this country; but we are not sure that the practice condemned is not the best for a large public collection. Of course, we do not mean that the few flowers of unique specimens should be saturated

with hot glue, and thus rendered useless for examination.

Dr. Reichenbach devotes his preface to a tributary notice of the lamented Dr. Lindley, whose pupil and rival he was in the study of the *Orchideae*.

THE last part of the *Nederlandsch Kruidkundig Archief* contains "The Report of the Twenty-seventh Annual Meeting of the Netherlands Botanical Society," by the Secretary; "Plants observed at Hilversum, Huissen, and Blaricum," by various botanists; "Additions to the Moss Flora of the Netherlands," by Dr. C. M. van der Sande Lacoste; "Additions to the Fungus Flora of the Netherlands," by Dr. C. A. J. A. Oudemans; "On a Case of Spiral Torsion of the Stem of *Valeriana officinalis*," by Dr. W. F. R. Suringar; "On a case of Synanthry in *Orobanche Gallii*," by the same; "Researches into the Nature of Lichens," by Dr. M. Treub; "Catalogue of Plants found in the Dunes of the Netherlands," by F. W. van Eeden.

Botanische Zeitung, January 1, 8, and 15.—Contributions to the physiology of the plant-cell, by J. Tschistiakoff. The first part, which is continued through the three numbers before us, is devoted to "short notes and preliminary communications on the development of spores and of pollen," with a plate. In the number for January 15 there is a brief report of the meeting of the Brandenburg Botanical Society, October 30, 1874. Professor Hartig spoke of the symptoms of decay exhibited by living forest trees. The "red-rot" (*Rothfäule*) of pines is caused by the penetration and diffusion of the mycelium of a fungus, *Trametes Pini*, Fr., in the heart-wood, whose reproductive parts appear on the outer surface of the branches, especially in branch holes. The spores produced fall on the exposed surface of newly broken off branches, and thus it may soon become widely spread. The various species attacking other common forest trees, which colour the wood red, green, brown, &c., were also considered. Mr. Pringsheim read a paper on the yellow colouring matter of bleached plants, of flowers and of autumnal leaves, in which he endeavoured to show that these tints are simply modifications or states of chlorophyll. He affirms that all the colouring matters named show exactly the same lines in the spectrum, if sufficiently thick sections are used. A more detailed paper on the same subject, by Mr. Pringsheim, has since appeared in the *Monatsbericht der Berliner Akademie*, October, 1874. Mr. Bolle and other members made some communications respecting the occurrence of mistletoe on the common oak, from which it appears that it is exceedingly rare in Germany, if indeed it occurs at all on this tree. It is reported as growing upon *Quercus coccinea* and *Q. palustris*, two North American species of oak.

AT the November meeting of the same Society, Mr. Wittmack exhibited a new small-leaved form of the common Beech, *Fagus sylvatica microphylla rotundifolia*, and also an exceedingly small-leaved form of *Quercus sessiliflora*. The same gentleman showed an example of stick-lac and wood of *Ficus religiosa*, which one of the first violin-makers of Berlin had found in the house of Amati of Cremona, and sent to him for determination. According to this gentleman's view the superiority of the Cremona violins is in a great measure due to the employment of this lac.

Oesterreichische Botanische Zeitschrift, January.—"Gallery of Austrian Botanists," portrait and biographical notice of Alexander Skofitz; "On the Occurrence of Hairs in the Intercellular Spaces of the Mesophyll of *Philodendron pertusum* (*Torrelia fragrans*)," by Professor Wiesner; "On the Definite Direction of the Oxalic Acid Crystals in the Mesophyll of the Petiole of *Pontederia crassipes*," by the same; "Plantas in Itinere Africano ab J. M. Hildebrandt collectas, determinat W. Vatke"—this paper contains the Scrophularineae collected in various districts from Alexandria to

Abyssinia. One new genus, *Urbamia*, is described. The remainder of this number is occupied with contributions to the floras of various parts of the continent.

Flora, January.—"Address to the Readers." "On two Questions affecting Botanical Nomenclature," by Dr. Celakovsky—this is another addition to the discussion of the difficult question of priority, and refers more particularly to the priority of specific names when the generic name is changed, and the period from which the priority of generic names shall date. As it is still unfinished we shall leave the further consideration of it at present. "Addenda nova ad Lichenographiam Europeanam, exposita W. Nylander"—this is a continuation, and contains descriptions of about thirty new species.

Discovery of Phyllica arborea in Amsterdam Island.—In a recent number of the *ACADEMY* this interesting discovery is announced; but, through a remarkable inadvertency, undue importance is attached to the fact. Previously, it is true, *Phyllica arborea* was only known from the Tristan d'Acunha group, but as the two places are not separated by the African continent, this is only one of several instances of remote habitats of the same plant. If the African continent actually intervened between the two stations, and the plants in question were absent from the main land, we should have a far more inexplicable fact to deal with, especially as there are upwards of fifty species of the same genus in South Africa. Mr. Moseley's discovery of the Kerguelen's Land cabbage, *Pringlea antiscorbutica*, in Marion Island, is another interesting addition to our knowledge, especially as since it was first found in Kerguelen's Land, it has been collected in the intermediate group called Crozet Islands. The peculiar distribution of such plants as *Myosurus aristatus*, *Oxalis Magellanica*, *Nertera depressa*, *Acaena Sanguisorbæ*, *Tillaea moschata*, *Crantzia lineata*, *Pelargonium australe*, &c., &c., renders it difficult to account for the present vegetation of New Zealand, and the isolated islands of the South Seas.

THE fine series of specimens of fossil copal, containing various insects, sent to the Kew Museum by Dr. Kirk, created much interest when exhibited at the Linnean Society by Dr. Hooker, as did also the specimen of wood of the Zanzibar copal tree, *Trachylobium Hornemannianum*, infested with the larvae of a white ant. Several plants of this important tree have recently been raised from seed at Kew. These are, we believe, the first living plants in Europe. We do not know whether the question of providing a supply of copal for future generations is to be considered.

THOSE interested in the natural products of India will find a useful aid in Dr. M. C. Cooke's *Report on the Gums, Resins, Oleo-Resins, and Resinous Products in the India Museum*. It is a compilation, and by no means a critical one, a circumstance to be regretted. No system of nomenclature is followed, obsolete names are employed, and extracts seem to have been made at random. The substances are classified, and as there is no index, it would be necessary to start with some knowledge of your product, in which case the value of the book is doubtful. But for references to other works, and native names, it will prove very useful, as the references are brought up to so recent a date as Flückiger and Hanbury's *Pharmacographia*. Brandis's *Forest Flora*, a book containing much original information, appears to have been overlooked. Dr. Birdwood's elaborate memoir on the genus *Bonwellia*, which originally appeared in the *Transactions of the Linnean Society*, is given as an appendix.

PROFESSOR F. W. AUGUST ARGELANDER, the eminent astronomer, died at Bonn on February 17, at the age of seventy-five. Argelander who was born at Memel, after studying at Königsberg became assistant to Bessel in 1820, and received

three years later the chair of astronomy at Abo, in Finland, which he exchanged in 1832 for a similar post at Helsingfors. It was during his residence at the latter place that he devoted himself with special zeal and success to the observation of those fixed stars which can be shown to have a definite motion of their own. In 1837 appeared his great work on the movement of the solar system, and the importance of the observations which it recorded, together with the interest attaching to his determination of 390 fixed stars, which had moved more than fifteen seconds in the direction of the constellation of Hercules between 1755 and 1830, led to his receiving a special call from the University of Bonn to take the direction of an observatory which had been built expressly for him. This building—which, however, was not completed till 1845—became the scene of his important observations of the nature of variable stars, and of his famous zone observations of 50,000 stars, completing the survey of the Northern Heavens as far as stars of the ninth magnitude, which Bessel commenced. Argelander's *Uranometrie*, with its exact definitions of stellar magnitudes, will, like his recently completed *Atlas of the Heavens*, serve as an imperishable monument of his theoretical and practical mastery of astronomical science.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY (Monday, February 1).
SIR SIDNEY SMITH SAUNDERS, C.M.G., President, in the Chair.

Mr. Clermont Livingstone was elected an ordinary member, and M. Aug. Sallé a foreign member. Mr. Stevens exhibited a variety of *Noctua glaucosa*, and Mr. Champion some specimens of *Amara continua*, a species recently detected in this country. Mr. Herbert Druce exhibited a fine collection of *Rhopalocera* recently received from Santarem. The President exhibited a nest of *Polistes gallica* taken on the Esplanade at Corfu, of which the cells were partly constructed with coloured paper taken from some play-bills posted in the vicinity, as alluded to in his anniversary address delivered at last meeting.

Mr. Smith remarked on *Colletes cucicularia* having been found a few years ago in the Isle of Wight and in Liverpool. In 1873 he had transported some specimens from the latter locality to Shirley Common, and he had reason to believe that he had succeeded in establishing a colony there, as the insect had been taken near the spot in 1874 by Mr. D'Arcy Power.

A paper was communicated by Mr. A. G. Butler on the *Rhopalocera* of Australia.

A paper was read by Mr. W. Arnold Lewis on "Entomological Nomenclature and the Rule of Priority."

ROYAL ASIATIC SOCIETY (Monday, February 15).

JAMES FERGUSSON, Esq., F.R.S., D.C.L., V.P., in the Chair. A paper was read by the Rev. J. Long on "Eastern Proverbs and their Utilisation for Oriental Research." After pointing out the political value at the present time of the Government of India being acquainted with the feelings and opinions of the masses in India, the paper referred to Eastern proverbs as the key to much of the social life of the people, and especially of the women shut up in zenanas. They were often like ancient coins, opening out a vista into the inner life and guiding us where history failed. The lecturer then pointed out the importance in the present transition state of the Eastern mind of collecting, interpreting, and publishing all concerning the proverbs of the East in relation especially to ethnological and sociological questions; and the facilities presented in India for carrying out this plan through the Asiatic Societies, the Directors of Public Instruction, and other agencies. References were made to the progress in Russia regarding proverbs, and an outline of the needs of

proverbial research was given from the Russian work of Snegrief. The archaisms of proverbs might, in Mr. Long's opinion, throw light on the connexion between the Dravidian and Turanian languages, on the affinities of the aborigines of India, or the connexion between the Prakrit and Sanskrit languages. Proverbs were also of great use in giving foreigners a higher opinion of the intelligence and observation of the common people, and in forming a link between the book-taught and the book-ignorant classes. The rising vernacular literatures of India were marked by the freer use made of the illustrations by proverbs, and in teaching and preaching to natives they supplied a store of most valuable illustrations to make Scripture truths more accessible to the masses. Instances were given by quotations from Bengali, Telugu, and Russian proverbs.

Mr. J. F. Dickson, Ceylon C.S., then delivered a lecture on some picture stories from the Buddhist Jātakas, or histories of former births of Gautama Buddha. The lecturer observed that a great deal had been done during the last forty years to make known in Europe the doctrines of Buddhism, but little or nothing was known of its practical working as a religion of daily life of one-third of the human race. It had been his endeavour, during a lengthened residence in Ceylon, to ascertain the character of the religious spirit of the Sinhalese people, and to make himself acquainted with the means of Buddhist religious instruction throughout that country. To show how interesting a field an enquiry of this kind might open up, he had brought with him copies of two series of picture stories illustrating the history of two births of the great prince who finally became Gautama Buddha, before his final birth and attainment to supreme Buddhahood—i.e., during the probationary lives when he had to fulfil all righteousness. The history of each of his recorded births, 550 in number, taught some great moral lesson. It was very common to find representations of these stories on both the outer and the inner walls of village temples, and there might be seen mothers explaining the pictures to their children, and thus the great practical lessons of Buddhism were impressed upon the young by the aid of both eye and ear. The pictures exhibited by Mr. Dickson illustrated two important stories or births. One was known as the Telapana-jātaka, and was designed to teach the duty of controlling the passions and resisting the temptations of the five senses. The other, the Wesantara-jātaka, the last birth of Buddha before the final birth in which he attained to Buddhahood, was the history of the prince Wesantara, and enjoined the religious duties of charity and self-denial. In conclusion, the lecturer pointed out the great value of these picture stories as a means of religious instruction in a country where there were no printed books, and where manuscripts were scarce and expensive; and also the great interest which these representations possessed in Europe on account of the evidence which they afforded of the continuity of Buddhist tradition, at least from the commencement of the Christian era. After some remarks of Sir M. Coomara Swamy, cautioning the meeting against taking these modern pictures to be faithful representations of the details of native life, such as dress, in the times when the Jātakas originated, the chairman pointed out the very great importance of the carved representations of these legends on the Buddhist temples in India, such as the Amravati, the Sānci and the Bārahāt tope, recently discovered by General Cunningham, as showing conclusively that these stories were not comparatively modern inventions, as scholars in general had until lately been inclined to believe, but that they must have existed at least two or three centuries before the Christian era in exactly the same form in which they had come to us in the Buddhist books, and in which they were represented on the modern drawings brought home by Mr. Dickson.

ENTOMOLOGICAL SOCIETY (Monday, February 15).
SIR SIDNEY SMITH SAUNDERS, C.M.G., President, in the Chair.

Mr. Frederick H. Ward was elected an ordinary member.

Mr. Phipson exhibited a singular variety of *Strenia clathrata* from Basingstoke, the wings being nearly unicolorous.

Mr. F. Smith exhibited a second collection of *Hymenoptera* from Mr. Rothney, of Calcutta, containing 1,573 specimens, all in the finest condition. There were probably not more than twenty-five undescribed species, but from twenty to thirty species (which were hitherto represented in the British Museum by a single sex) were represented in this collection by both sexes.

Mr. Verrall exhibited some living fleas taken two days previously from inside the ears of a rabbit near Lewes. They were gregarious in this situation, and in such a position that the animal was unable to dislodge them by scratching. He alluded to a communication made to him by Mr. McLachlan regarding a species from Ceylon which was gregariously collected in a very limited space on the neck of a fowl, and which had been exhibited at a recent meeting of the Microscopical Society. They were affixed to the skin of the fowl by the proboscis, so that only the tails were visible outwards. Mr. Cole said he had found fleas in a hedgehog, and Mr. W. Arnold Lewis had observed a species in a marmot in Switzerland.

Mr. Dunning called attention to a recent extract from a French paper, in which it was stated that a paint could be manufactured from cockchafer.

The Rev. R. P. Murray stated that Mr. Edwards, of Virginia, was very desirous of obtaining pupae of *Pieris napi*.

ZOOLOGICAL SOCIETY OF LONDON (Tuesday, February 16).

GEORGE BUSH, Esq., F.R.S., V.P., in the Chair. The Secretary read a report on the additions that had been made to the Society's Menagerie during the month of January, 1875. Mr. Slater exhibited a drawing of a supposed new rhinoceros from the Terai of Bhootan; and exhibited and made remarks on a living specimen of the Péguan tree shrew (*Tupaia péguan*). Mr. A. H. Garrod read a paper on a point in the mechanism of the bird's wing, which renders it so specially adapted for flight. Mr. Slater read remarks on the Cassowaries now living in the Society's gardens; Professor Owen, C.B., communicated a note on the discovery of the remains of various species of Dinornis in the province of Otago, New Zealand; Mr. Edward R. Alston read a paper on *Anomalurus*, its structure and position; Mr. H. E. Dresser read some notes on the nest and eggs of *Hypolepis cabigata* and on the egg of *Charadrius asiaticus*; and Mr. R. Bowdler-Sharpe communicated a paper on the birds of Labuan, in which was given an account of a collection made in that island by Mr. John Low.

ROYAL SOCIETY (Thursday, February 18).

THE following papers were read:—"On the Nature and Physiological Action of the *Crotalus* Poison as compared with that of *Naja tripudians* and other Indian Venomous Snakes," by Dr. Brunton and Dr. Fayer. "On the Number of Figures in the Reciprocal of each Prime Number between 30,000 and 40,000," by W. Shanks.

NUMISMATIC SOCIETY (Thursday, February 18).

PAPERS were read—

(1) By Mr. Gardner on "Coins bearing the Name Plautiana." The writer adduced the evidence of several unpublished coins to prove that there was not, as usually supposed by numismatists, an Empress of this name, wife of Pescennius Niger;

but that all coins bearing the name of Plautiana were struck in honour of Plautilla, first wife of Caracalla, and daughter of the well-known Plautianus.

(2) By Mr. Henfrey on "The Naval Medals of Cromwell." Mr. Henfrey traced from state documents the history of the dies from which these were struck, as well as the Dunbar medal and others.

(3) Extracts were also read from a long paper by Mr. Madden, comprising a continuation of his survey of the field of Jewish numismatics, and his criticisms of the more recent investigations of De Saulcy, Reichardt, and others, which have appeared since the publication of his work on Jewish Numismatics. The history of the Herod family was the subject of the present paper.

CHEMICAL SOCIETY (Thursday, February 18).

PROFESSOR ODLING, M.A., F.R.S., President, in the Chair. Professor J. Clerk Maxwell, M.A., F.R.S., made his long promised communication "On the Dynamical Evidence of the Molecular Constitution of Bodies." The paper, which was of a somewhat abstruse character, was listened to with close attention by a large audience. The following is a brief account of it. In attempting to apply dynamical methods to the study of chemical phenomena, we are obliged to form some idea of the configuration and motion of the exceedingly small parts of which bodies are made up. The mathematicians have given us methods of sufficient generality for the study of the motion of any material system however complex, but the main point is to determine what relations among the motion of the parts correspond to observed phenomena of the medium in mass. It is well known that the motion of the parts of a system has a tendency to make the system spread out, and that repulsion between its parts would have a similar effect, while attraction between the parts would tend to make the system occupy less room.

A very elegant method of separating between these two causes, motion and stress, which affect the volume of the system, has been invented by Professor Clausius, of Bonn, who has shown that the effect of stresses, whether attractive or repulsive, between the parts may be expressed as the sum of the *Virials* of the stresses. The virial of a stress, according to the definition of Clausius, is half the product of the stress into the distance across which the stress is exerted. Clausius reckons it positive when the stress is attractive or tensile, and negative when it is repulsive, or of the nature of pressure. It is represented by $\frac{1}{2} Rr$,

where R is the attraction and r the distance between the attracting bodies. The virial of the mass is the sum of all the virials of the stresses between every pair of particles belonging to the mass. The equation which indicates the two causes of external pressure is of the form

$$pV = \frac{2}{3} T - \frac{2}{3} \Sigma \left(\frac{1}{2} Rr \right),$$

where p is the pressure of the fluid, V the volume of the containing vessel, T the kinetic energy arising from the motion of all the particles of the medium, and $\Sigma \left(\frac{1}{2} Rr \right)$ the virial.

It was shown that in a rare medium the part of the pressure depending on the mutual action of the particles must vary as the square of the density, while that depending on their motion varies as the density simply. Now, in ordinary gases the pressure varies very nearly as the density simply, so that no considerable part of the pressure can be due to the mutual action of the parts. As the density increases, the pressure begins to deviate from that given by Boyle's law; and it appears from the experiments of Regnault that the deviation from Boyle's law is at first nearly as the square of the density, and that in most gases the pressure is less than that given by

Boyle's law, showing that the mutual action of the particles is, in the main, attractive. When the density is still further increased, the pressure may in some cases reach a maximum and then diminish, but in all cases the pressure becomes ultimately greater than that given by Boyle's law, showing that, when the density is very great, the action between the particles is in the main repulsive.

The condensation of gases into liquids, the phenomena of liquids heated above their boiling point or cooled below their freezing point, and of the critical point at which the distinction between gas and liquid ceases, were illustrated by a model of a surface constructed on a plan described by Professor J. Willard Gibbs, of Yale College, U.S.

The pressure of a gas depends on the agitation of the centres of mass of its molecules. The motion of the constituents of the molecules relative to the centre of mass has been studied by Dr. Ludwig Boltzmann, who finds that the average kinetic energy of each constituent of every molecule at the same temperature is the same. The application of this result to the dynamical proof of the law of equivalent volumes of gases was pointed out, and the difficulty of accounting for the observed measurements of the specific heat of gases on the hypothesis that their molecules are complex dynamical systems was stated to be the greatest obstacle which molecular science has yet encountered.

With respect to the optical properties of gases, it was stated that by means of a theorem due to Lord Rayleigh, the absorptive power of a medium containing molecules could be calculated; and it was found to be quite as small as we have any reason to believe that of air to be. The electrical properties of gases have not as yet been accounted for. Dense gases are excellent insulators; the insulation of rare gases is good, but easily overcome, whereas an absolute vacuum is one of the best of all insulators.

Finally it was shown that the luminiferous aether, if it consisted of molecules, would be neither more nor less than a gas, the specific heat of which would be the same as that of any other gas for equal volumes. We cannot, therefore, admit that the aether is molecular, for in that case its presence would produce results which could not fail to be detected in experiments such as those of Regnault on the specific heat of gases.

LINNEAN SOCIETY (Thursday, February 18).

DR. COBBOLD read a paper on the supposed rarity, nomenclature, structure, affinities and probable source of the large human fluke (*Distoma crassum*, Busk). The author commenced by recording all the facts he could gather respecting the original discovery of the parasite by Professor Busk, dwelling especially on the circumstance that an interval of thirty years had elapsed since the first examples were made known to science. He next referred to other singular instances of the supposed rarity of certain human helminths, adducing the cases of *Taenia nana* and *Distoma heterophyes*, and he also remarked upon the long lapse of time occurring between the periods of discovery and verification of particular species of Entozoa, instancing the cases of *Stephanurus dentatus* and *Distoma conjunctum*. He was indebted to Dr. George Johnson, F.R.S., for having brought the new hosts or bearers of *Distoma crassum* under his observation. The patients, a missionary and his wife, had been four years resident in China, most of their time being spent at Ningpo, where they had partaken freely of fish, oysters, and salads. The author of the paper had secured seven parasites, two from the lady and five from her husband. Only two of the seven specimens supplied him with such new facts as he had been able to make out in respect to the parasite's organisation. The one example which gave the best results Dr. Cobbold had since deposited in the

University Museum at Oxford (Professor Rolleston's department). He found the vitelline glands to be largely developed; and he believed that in place of there being two testes, as had hitherto been conjectured, there was only one large compound gland, whose seminal ducts were remarkably large and conspicuous. The ducts were well seen in the dried specimens exhibited to the Society. The hitherto supposed upper testis turned out to be the ovary, and there was a special and smaller organ in front of the ovary which he regarded as an unusually developed shell-gland. The intestinal tubes are simple and unbranched, but, on the other hand, the uterine organ appeared not to consist of a single continuous tube, but to be partly branched, as obtains in *D. lanceolatum* and in some other less-known flukes. The remainder of the communication was taken up with remarks on the affinities of the parasite, and with a brief *résumé* of the hitherto known facts of trematode development, in so far as they tended to throw light upon the source of *Distoma crassum*. In particular he referred to the labours of Mr. Moseley in connexion with the land planarians of Ceylon, to the contributions of Giard, Claperède, Pagenstecher, and others in respect of *Bucephalus*, and to the still more recent discoveries of Dr. Ernst Zeller as regards the destiny of *Leucochloridium*. From a general review of all the data thus obtained, Dr. Cobbold believed that the *Distoma crassum* had been obtained by the consumption, on the part of the missionary and his wife, either of Ningpo oysters or of fish insufficiently cooked.

GEOLOGICAL SOCIETY (Anniversary Meeting, Friday, February 19).

PROFESSOR DE KONINCK, of Liège, received the Wollaston medal in recognition of his palaeontological researches, especially with reference to the Carboniferous Limestone of Belgium. The Murchison medal was awarded to Mr. W. Jory Henwood, of Penzance, for his contributions to mining geology. The purse containing the balance of the Wollaston fund passed into the hands of Mr. L. C. Miall, of Leeds, who has worked steadily and successfully on the structure of the Labyrinthodonts; while the balance of the Murchison fund was handed to Professor H. G. Seeley as a stimulus to his labours on the osteology of fossil saurians. In delivering the Anniversary Address, the President (Mr. John Evans, F.R.S.) referred to the removal of the Society from Somerset House, and dwelt on the advantage of having their present rooms in proximity to the Museum of Practical Geology and the headquarters of the Geological Survey. Going back to the origin of the Society, he traced its history and development, and dilated upon its present flourishing position. After referring to the Sub-Wealden Exploration, and some other topics of general interest, the President addressed himself to the special subject of his discourse. This was the history of our knowledge of the antiquity of man, especially as revealed by his remains in cave-deposits and in river-gravels. The President expressed his doubts as to the accuracy of those observations on which it had been asserted that the remains of man had been found in Miocene beds in France, and suggested that there might also be some error in determining the pre-glacial age of the human fibula from the Victoria Cave. He pointed to explorations in tropical countries as being most likely to yield the earliest traces of man, and hinted that some researches were in progress in Borneo.

The result of the ballot for officers and council was as follows:—President, Mr. J. Evans; Vice-Presidents, Professor Duncan, Mr. Etheridge, Sir C. Lyell, Professor Ramsay; Secretaries, Mr. D. Forbes, Rev. T. Wiltshire; Foreign Secretary, Mr. W. W. Smyth; Treasurer, Dr. J. Gwyn Jeffreys; other members of Council, Mr. Bauerman, Mr. F. Drew, Sir P. Egerton, Mr. Godwin-

Austen, Dr. H. Hicks, Professor T. M'K. Hughes, Dr. Hulke, Mr. Meyer, Mr. Carrick Moore, Mr. S. Sharp, Mr. H. C. Sorby, Professor Tennant, Mr. Whitaker, and Mr. H. Woodward.

PHILOLOGICAL SOCIETY (Friday, February 19).

REV. DR. R. MORRIS, President, in the Chair. The papers read were:—1. A Memoir of Observations made between the years 1863 and 1873 on the attack made by the Individual on Spoken Language, and a Proposal to apply the Method of direct Experiment in Philological Science, by Mr. James M. Menzies—giving the alterations made by five young children in our standard words. 2. On the Dialectal Characteristics of the Rushworth Gloss, by Dr. James A. H. Murray. (a) The Rushworth used *p* for the Lindisfarne *ð*; and *k* often for *c*. (β) *h* was used for *c*; *i* for *ge* (as *iara* for *geara*); *h* is used arbitrarily, *his* for *is*; and is often dropped, *is* for *his*, *laferd* for *hlaforð*, *wa* for *hwa*; the umlaut of *o* is kept, and not turned into the West Saxon *e*, as *soece* for *sece*; also the umlaut of *a*, as *waet* for *wel*; *mae*, *maere* for *ma*, *mare*, &c. A. Sax. *ea* becomes Rushworth *a*, *eal*, *al*; *a* becomes *o*, as *hond*, *hand*; *y* is never used for short *i*; *y* is written with *o*, *hym*, *heom*, them; *eo* becomes *iu*, *seo*, *siu*, she; *i* is turned into *io*, as *nime*, *niome*. Verbal *on* is *un*, as *we magun*. Case-signs are often left out, as *heafod loccas*; the dative is in *ae* and *a* instead of *e*. Prepositions govern improper cases, nouns have irregular plurals. The weak declension of nouns is much broken down; for the plural *an* appear *u*, *a*; and *man* is declined according to this declension. Adjectives are often undeclined; sometimes the termination *u* runs through all the cases. In comparison, full forms like *leaset* occur. Pronouns: *was* for *we*; *dat*. *eow*, acc. *eowic*; *hie* for *hi*, they; poss. *user* is in use for "our." Def. Art.: acc. *pame* is used for *pone*. The relative is *sepe*. Verb: *ge* of past participle is often omitted, though used in the West-Saxon in the time of Stephen. Contracted terminations are not used, as *sended* for *sent*. 1st pers. sing. ends usually in a vowel; the *ig* is retained in the plural; the *p* in the third singular, none in *s* occur. The past tense ends in *ade* sing., *adun* pl. Imperative, West-Saxon *cume* *ye*, Rushworth keeps the *p* *etep* *we*, *sellaþ* *ye*, &c., &c. There is a tendency to use auxiliaries. *ic beam* occurs (though *eam* is more common); and *beopan* "are," *for* is sometimes used for *beforan*. The dialect is probably North-Midland; it has on the one hand older characteristics than the West-Saxon, and on the other much later ones. It was the dialect of (perhaps) about Derbyshire. Dr. Morris said he had come independently to the conclusion that the dialect of the Rushworth Gloss was North-west Midland.

FINE ART.

THE ROYAL SCOTTISH ACADEMY'S EXHIBITION.

Edinburgh: Feb. 16.

Most of the important names appearing in the catalogue of the Scottish Academy's Exhibition—an exhibition opened to the public for the first time on Saturday last—are names with which the May and June visitors to Burlington House are necessarily familiar. Of these, most are Scotch names—Mr. MacWhirter, Mr. Peter Graham, among landscape painters; Mr. Pettie, Mr. Orchardson, among figure painters; and Mr. Archer among painters of portraits. One or two others are of European repute—Mr. Alma Tadema's, for instance, whose works are hung alike in Paris, London, Edinburgh. These are the best known names. But there are also names of the greatest local and some general fame—Sir George Harvey's and Sir Noel Paton's chief of these. Again, among conspicuous exhibitors are certain Scotch Academicians, who, like certain of their antiquated brethren in London, claim their place upon the line not exactly by virtue of merit. And again, there are the rising men—some of them Associates: some of them without that dignity—

and of the rising men nearly all are painters of pure landscape or landscape with figures.

And, indeed, it is in pure landscape and landscape with figures, that the Scottish School—the School still here in Edinburgh—is strongest. One was told that one would find the Scotch art-work of the day roughly divided into two sorts: some of it taking Mr. Faed for its leader, and the rest Mr. MacWhirter or Mr. Peter Graham. But one does not find this to be exactly the case. Little work, either of any present quality, or promise for the future, takes after Mr. Faed.

Mr. John Smart's pictures are conspicuous among the landscapes. He paints almost always wild or barren scenery, but with much variety of effect. A mountain-line; the head of a loch; some wild wet pasturage with rough brown herds of cattle; the reeds and marsh by the lake side; the rain-cloud charged with rain for to-morrow—he knows these things and paints them, in compositions generally well-considered, and true and good in colour and tone. Of his larger works, exhibited this year, one does not know whether to prefer No. 327, *Head of Glen Ogle*—which is the more immediately impressive—or No. 275, *The Hill Fank—Clipping Day*. The loneliness of the landscape is relieved by herds of cattle in the first; by figures in the second. But the figures do not count for much. The cottage on the hill-side, and the cart on its beam ends, its shafts uplifted in the air—tell more in the composition. The cattle in the other picture are introduced with the greatest skill and effect. The near group and the far group both tell decisively. And though Mr. Smart's drawing of animal form is not always of the strongest—nay, in one small picture otherwise admirable, is positively weak—his sense of a herd's movement is very true; each beast goes his own way, yet all go together. And in the indication of this movement there is spirit and force.

Over all the mountain landscapes by indifferent hands, there is no need to pause; nor need anything be said here of work important as Mr. Peter Graham's *Northern Walls*, which has already been seen and criticised in London. Sir George Harvey, the President of the Scottish Academy, sends a picture which one feels to be purely a composition, and its name implies as much. *Scenery in the Highlands* it is called. And as composition no doubt it is good; true and observant too in many a detail; but in no sense the record of vivid personal impression, and with no dominant sentiment.

Mr. Waller Paton sends a very large landscape, full of subject well enough managed, without apparent crowding; but wanting in concentration, and as a whole unpleasant and untrue in colour. I am speaking of No. 276, *On the Cree, at Newton Stewart*. Of simpler landscape-subjects—well found, rather than composed—one must name especially *Carting Sea-weed*, by Mr. A. D. Reid: a large picture, saved only by skilful treatment from being too large for its theme. For its theme is of the simplest. One or two figures, not in themselves striking; a cart, a horse—and all these grouped together in the centre of a great canvas, and all dark, against a flat grey sky. The beach is wide and unbroken, and the sea wide—neither rough enough to be very interesting to quite common eyes, nor calm enough to be to these very beautiful—and there is nothing in the picture but this group doing their simple work, under the light of every day. The thing is well done—simplicity of subject: simplicity of means.

Another of the landscapes of common life and every day is Mr. Lawton Wingate's—No. 1. It is called *Potato Harvest—Gleaning—in Ayrshire*; and is just the subject which Millet would have treated with consummate power. Mr. Wingate's intention is better than his attainment. The landscape itself is somewhat wanting in character; some of the grouping not very telling. Much however in attitude of girl and child—I mean the child putting her gleaned potato safely into her sister's rough field-apron—is to be praised; and one is willing to think that the

simple sentiment of the subject was felt better than it has been expressed. In any case, the work is to be commended in so far that it does not seek its interest either from the easy sublimity of mountains or from any pettiness or childishness of incident—domestic sentimentality, so sure of successful appeal.

Kelp Burners, in Gigha, by Mr. J. Oswald Stewart (No. 121), is an unequal but very noteworthy work: wanting indeed in atmosphere and distance; but with figures excellently grouped and excellently lighted; with individual character in one at least of the girls, and with admirable drawing and colour in the deep sea, its surface blown pleasantly by the fresh light breeze. A mainly piece of work is No. 546, *Singling Turnips*, by Mr. James May. It is a group of figures, large in the field, and recalls ever so little the work of Jules Breton, and his best pupil, Billet. But its figure-drawing, naturally enough, has not the strength of the master, nor have its lines the rhythm of the pupil's best work—*Grass Cutters*, shown a year or so ago at the French Gallery.

A work of Jules Breton's, in last year's Salon—a strapping Breton girl lying face downwards, on a rock, by the sea—is recalled a little by another man's work which is here: the work of Mr. John Reid, who paints large children's figures in open air light, and paints them frankly for the figures' sake and the light's sake. *Resting: a Scene in Surrey* is a good example of Mr. John Reid's style. A healthy girl, some twelve years old, has been grubbing in the garden for potatoes, and now stands, with long potato fork in hand, against the wooden palings, and her face is shadowed partly by a broad hat, and a straw-grey working apron is tied over her blue-grey gown. In a second picture, the same girl stands with a big jug, in a bit of paddock, bright green with the morning.

Mr. Hay's large picture, *With the Spae Wife*, is perhaps the most noticeable work of domestic or familiar incident or anecdote. It tells its story very thoroughly. A much smaller work of Mr. Hay's—with "Somebody Coming," for its commonplace title, shows more point and is conspicuous for a bit of figure-drawing, sharp, expressive, and decisive. Of Mr. Pettie's *State Secrets*, seen at the Academy, I need speak no more than of Mr. Orchardson's *Monsieur and Madame*.

Now, indeed, we are among more formidable work, and in this higher class of work of which examples are conspicuously few, Mr. Alma Tadema's *Cleopatra* stands in a good place. Here too, as very rarely in Mr. Tadema's pictures, antiquarianism is in the background, and human interest is to the front. *Cleopatra* is a good realisation of character—such as Mr. Tadema has conceived it—and a perfect realisation of mood. Thoroughly has Mr. Tadema known here what he wanted to do: thoroughly also has he done it. But an Art Note in the ACADEMY has already, as I recollect, described this picture, to which otherwise a much larger place would have been due in any notice. Mr. Tadema's *Cleopatra* is not the intellectually-dowered *Cleopatra* of Shakspeare, nor is she quite the common woman of Alexandria some of her northern critics have pronounced her to be.

There are many bad portraits, though none worse than one may see in London. There are also several good ones, though none of the first excellence. Still, there is very little of the best of contemporary work, which can surpass in truthfulness No. 380: a portrait (by Mr. Wm. Mac Taggart, R.S.A.) of an old woman with a certain humour in her pinched face and observant eyes. No. 457, Mr. George Reid's portrait of Mr. James Crombie, is also undoubtedly strong: perhaps more decisive, and showing a readier mastery, than that of Mr. MacTaggart. Mr. Archer has one or two single portraits, with his customary artistic feeling, and good, one may suppose, as likenesses, but not otherwise strong. For he is only at his best when painting a face very pretty to begin

with, and pretty with the prettiness of extreme youth—a face of promises, not records—and upon which undeveloped character has hardly begun to tell. Such a face—entirely healthy, refined, and serene—he has got in one of the three sisters who form his most considerable group, and to this face, seen in pure profile, he has given his best art, with high success.

FREDERICK WEDMORE.

DISCOVERIES AND ANTIQUITIES IN ROME.

Hôtel Costanzi, Rome.

The transformations now passing before our eyes in many picturesque localities of Rome are such that it is well to record them before old things have entirely vanished, with their comfortable and quaint peculiarities, disappearing (as they must ere long) in the pathway of modern improvement. The change is now strikingly apparent in the extensive region within this city's ancient walls, between S. Maria Maggiore at the northern limit and the S. Croce and Lateran basilicas at the south-east and south-west—a wide district, comprising the plateau-summits of the Esquiline, Viminal, and Quirinal hills, hitherto for the most part occupied by quiet convents, grey old villas amidst neglected yet pleasant-looking gardens, in part also by irregular streets, inhabited by a scanty population of the poorer classes. Along much of that high level ground, where the metamorphosis is in progress, we see certain landmarks of decided improvement, the growth, in fact, of a new and well-built civic quarter; but elsewhere the work is rather of demolition than construction, and we find yet but little indicative of projected novelties except the breaking up, or recent levelling, of the soil, the overthrow of ancient barriers and private enclosures, with long intersecting lines of ditches for drains, and foundation-walls, yet scarcely raised above the surface, for new streets. A long embankment, which extends through this region, and appears at a distance like a natural formation, is recognisable, when we approach, as the Agger of Servius Tullius; and we feel ourselves in presence of venerable antiquity when able also to distinguish the massive stonework, in square-hewn blocks, of the walls of that fortification commonly named after the same king, piled up, and in some places rising to considerable height, against the steep shelving bank of ancient earthworks. One may notice (without admitting as more than conjectural) the conclusion that one of the most conspicuous amid these remnants of the Servian structure may be the foundation-walls used in the villa of Maecenas for a lofty tower, whence the view of Rome must indeed have been grandly panoramic, and from which it has been imagined that Nero looked down on the sublimely terrible spectacle of the conflagration. More distinct and intelligible are other remains found near the same spot, and suddenly beheld as we approach the brink of a wide excavated area, descending into which by a steep path, we perceive the surrounding ruins, in part well preserved, of a stately and spacious hall, now quite roofless, marked by features and enriched by adornments which are both singular and interesting. At the extremity, opposite the entrance, rises a semicircle of seats in six gradines, like those of an antique theatre, the lowest being between two and three feet above the level of the floor. At the centre of that lowest range is a platform, where a declaimer, or reader might have stood in view of spectators assembled in front and at each side of him. The lateral walls, right and left of this theatric construction, are opened on each side into six high quadrangular niches, which may have served for statuary in the days of patrician pomp; and at the rear of the gradines of seats there are five similar recesses—once, no doubt, similarly adorned. The inner walls of those high niches, and likewise the intervals between, still retain painting on a stucco surface, in some parts fresh and brilliant, representing garden-scenes, flowering shrubs, plants, and a few figures,

like those (better preserved and superior in style) on the walls of a large chamber, the least ruinous portion of the suburban villa of the Empress Livia, at Prima Porta, about eight miles distant from Rome. On one wall-surface we see a picture that strongly reminds us of the "Canidia," the witch of the Esquiline, in Horace (Epode xvii.)—and it is on the same hill that the ruins recently brought to light are situated:—an old crone, squatting on the ground, while either admonishing or threatening, as the action of an upraised arm implies, a personage whose less complete figure enters into this painted group. It is supposed by Roman antiquarians that we see, in this quasi-subterranean hall on the high ground of the Esquiline, a state apartment in the luxurious villa of Maecenas, appropriated as an *auditorium*, or theatre for recitations; and who can say what immortal verse might have been for the first time made known, through declaiming by its author, within these walls? Here might Horace have enchanted by the music of his Odes, or Virgil won rapturous applause by the grandeur of his epic numbers.

A few minutes' walk from these ruins brings us to another excavated area, descending into which we find the most superb specimen of antique pavement yet brought to light among Roman buildings, and covering a considerable space at the level of some 20 feet (or more) below the surrounding region. In geometrical pattern are here laid the smooth slabs of coloured marbles, green serpentine and purple-veined Phrygian, together with diamond-shaped pieces of oriental and rose-tinted alabaster, most beautiful and rare of its kind. Here we perceive also several marble bases for columns, perhaps (in some instances) for statuary—the remnants of the shafts being concrete material—and the character of the remains leads to the inference that this edifice, recently unearthed, was either an unusually large aedicula or a small temple. It was in an adjacent excavated space on the Esquiline, that those sculptures were found, the discovery of which, speedily made known to all Europe through the telegraph, excited so much interest. I have seen them, and received the impression that most of them—all, indeed, with one exception—justify such interest, and fully come up to all the praises circulated with regard to them.

That supposed to be a Venus, a statue in Parian marble, of exquisite finish (height 1 mètre 50 centimètres), seems to me (and others agree with this conclusion) rather like a nymph, or an imaginary female figure, rising from the bath, and binding her hair with a fillet—such being the action of the arms, both wanting and just restored in clay, as may be inferred from the position of the sole hand, the right, partly preserved in the original, and placed on the head; the hair being simply braided and gathered into a knot behind. I have just seen this newly-celebrated, but, I think, over-rated, statue in the workshop, where, on the Capitoline Hill, an artist is engaged on its restoration—namely, in the clay model. I should describe this antique as interesting, marked by delicate grace and expressive sweetness, but *not* divine in character. The lovely countenance is that of an innocent girl of seventeen or eighteen years—not that of a majestic or self-conscious goddess; the forms of the figure being, however, full, rounded and mature. Beside the right leg is placed a vase, on which a small fish, of serpent-like shape, is seen in low relief; and on the lid of this vase lies a mass of drapery.

The other sculptures (now placed provisionally in a hall of the ancient Tabularium on the Capitoline Hill) are as follows:—Bacchus, heroic size, the limbs wanting, but the right hand preserved, and resting on the ivy-wreathed brow; the head remarkably fine, with a character of poetic melancholy—the nobler and most refined aspect of the Greek ideal, the true Dionysos of antique mythology.

It is evident that this statue has not been frac-

tured at the part where the lower limbs seem cut off, but not violently, from what is finished and extant; hence the conjecture that the legs were covered with drapery, probably of bronze, moveable, and of course separate from the marble-wrought figure.

Two Tritons, half statues rather than busts, having the heads preserved, in both instances beautiful, with massive curling hair, on which are slight vestiges of gilding; the broad chest of one of these figures being clothed with fishy scales; the other without that attribute, though both are alike distinguished by muscular vigour and a certain wild grandeur of aspect.

Commodus as Hercules, a half-length statue, heroic size, of most elaborate execution, and in all details minutely wrought up, the hair and curled beard especially marked by such carefulness. Both the arms are introduced; the right hand holding the club, the left the apples of the Hesperides; the head being covered, or hooded over, with the lion's hide, which hangs in massive folds over the fully developed chest and shoulders. The countenance is recognisable by its resemblance to many extant busts, but is more frank and pleasing than many portraits of the same Emperor. This valuable work of art stood on a highly ornate marble base found in numerous fragments, amid which is distinguishable a draped and graceful statuette, probably meant for a Victoria. Two draped female statues, life-size, wanting the arms, but otherwise entire, are perhaps Muses (those of song and dance, or Erato and Terpsichore, as one might conjecture), which characters would accord with the sweet and serious expression of both the heads. No attributes are preserved for our guidance as to these figures. A female head with hair gathered in a diadem-like knot, the distinction of the Venus of later art, is perhaps meant for Aphrodite herself, and, as it struck me, more worthy of such a subject than is the artistic conception in the statue above noticed. Another female head (discovered January 16, in the same *scavi* on the Esquiline), is of a still more interesting and beautiful type, the expression serious even to sadness, yet perfectly serene, the hair in wavy braids, the apparent age being beyond girlhood. This might be an Ariadne, after her desertion by Theseus; or an Andromeda chained to the rock, yet relieved from the terror of her impending fate by the approach of Perseus, the Deliverer.

Beside these, we see the limbs, more or less entire, of other finely-executed statues. Of life-size, or little more, are four legs, two being those of a seated figure with sandaled feet; the sandals having vestiges of the red paint which used to be applied before, and as preparatory to, the gilding of details in sculpture. All these limbs exemplify a style and an elaboration indeed admirable, though not distinguished by that breadth and grandeur proper to the highest, the *ne plus ultra*, of antique art.

It is inferred from the relative positions in which these precious sculptures were found, that the Bacchus, the Tritons, and the Commodus as Hercules belonged to some magnificent group superbly adorning a long-buried palace, or fane, on the Esquiline.

C. I. HEMANS.

February 14, 1875.

P.S.—The last remarkable ruins brought to light on the Esquiline Hill, about ten days ago, consist of the roofless chambers of a mansion with paintings on its stuccoed walls, and the lower part of a staircase between two rooms, one of which is semicircular; also, at a lower level than these, a considerable extent of pavement in black and white marble, a species of mosaic, the most pleasing detail in which represents a cluster of vine-leaves within a square black border. The newest treasure-trove from this same region includes a statuette of silver, which has been already removed to some private room in the Capitoline buildings. It proves, however, to be but a half-figure (mutilated), representing a household god. With it were

found two bronze statuettes: one, very small, of a similar subject and about equal in artistic character; another, much larger and decidedly superior, of a hermaphrodite—a standing figure, with the arms extended. These sculptures have been dug up among the ruins of a patrician mansion, not far from the *Thermae* of Diocletian and the railway station; the apartment in which they were found being evidently the domestic *lararium*. It is probable that the mansion was one of many either destroyed or covered with earth, in order to gain space for the extension of the buildings or premises of those vast *Thermae*, the largest in Rome, and with place for twice the number of bathers who could enjoy themselves in the baths of Antoninus at the same time.

Two of the admirable sculptures exhumed on the Esquiline about the end of December have been placed in the Museum of the Capitol within the last fortnight—the semi-colossal *Bacchus* wanting both the lower limbs and also the left arm, but with the right arm and hand, which rests on the beautiful head, perfectly preserved, as likewise is the body down to the upper part of the thighs; and the statue in Parian marble at first described as a *Venus*, but now regarded by critics (and by competent judges generally) as a nymph quitting the bath and about to attire herself. After seeing this sculpture in its permanent place, in the long gallery of the museum, I may report that it impresses me much more, and seems to demand a much higher tribute of praise than when I saw it first in the studio of an artist engaged in the restoration of the arms, both of which are missing. It then stood on the floor, so that one had to look down on the head and countenance. Raised, as now seen, on a lofty cippus, the head and countenance strike me as more lovely and more mature than when I first saw them. One might suppose it a woman of twenty-one years; and in the lovely features an observer sees an expression of tender thoughtfulness, almost sadness. To my surprise, I find that the restoration which I had seen finished in the clay—namely, of both the arms and hands—has been rejected, and the statue now stands precisely as found; those limbs wanting, and the fingers alone of the left hand, resting on the knot into which the hair is gathered behind the head, still in their place. No attitude is there that indicates the *Aphrodite* in art. The head is bound with a broad fillet, below which the hair clusters in close and formal curls over the brow. The vase beside the right leg, on which is laid a mass of drapery, has the ornamental detail of a serpent in low relief, and rests on a basis adorned with flowers—not easily recognisable and carelessly wrought out. One of the two draped female statues, supposed to be *Muses* (also found on the Esquiline), is now being restored (both were armless) by the same artist, whose work, added on to the so-called *Venus*, has not been preserved. C. I. H.

COROT.

By the death of Jean-Baptiste-Camille Corot, which happened on Monday, France has lost her greatest landscape painter. A brief notice, like the present one, written within a few hours of his death, is not the place in which to attempt any serious analysis of a unique genius, and of its fruit in work extending over half a century. The *Times* has called him an "historical painter," and has cited pictures of his "fully equal to any of Delacroix's." It is hardly, indeed, with Delacroix that it would have occurred to anyone acquainted with his works to compare him. What had the two men got in common? Nothing but "Romanticism," which is a name, or a flag. Delacroix fought the battle of Romanticism against Classicism—by this time the very terms are dead—he fought it eagerly, vehemently, and knowing the weapons he was using. This spirit of struggle was hardly in Corot, who began the pursuit of art

late (when he was twenty-six); studied with Bertin, who taught him little; and then went off to Italy by himself, and in the process of gradually perfecting his genius, produced works which were the record of his personal impression—his artistic dream. To this extent he was "a painter of history," that *Christ on the Mount of Olives*, *The Burning of Sodom*, *Dante and Virgil*, and *Macbeth* were among his themes; but even here for the most part the historical element was subordinated to the landscape and the impression, and in time these last became all.

And as a landscape painter he stood alone, or, if anything, founded a school, rather than followed one. Much of what is most powerful and most generally accepted in French landscape art derives from Constable—dates from the exhibition in Paris of certain of Constable's works. But nothing could well be further from the decisive and emphatic genius of Constable than this genius of Corot, which lost and found itself in the subtlest intricacies of aerial effect and in refinements of sentiment in landscape to which the great Englishman was a stranger. Corot was first of all a poet, and the brush was his means of expression. His work, like all work with a tender and delicate sentiment, gains gradually upon you; only gradually can you read his writing and receive his particular message. For years, men grumbled at his pictures for want of finish, and it may well be that he sometimes thought he had recorded an impression before he had done more than indicate it vaguely. But in the main he was right in stopping when he did: much of his landscape, peopled with shepherd and nymph, can never have been meant for the landscape of fact, true to geology and botany, but for the landscape of fancy and dreams and of chosen hours. Moonlight, a placid sunset, and the freshness of morning—mists quivering over the river, and the budding of trees in spring—these things he painted with a sentiment no living artist has been near to rivalling. And he kept, in undiminished force, for fifty years his gift. No pictures in the Paris Salon of last summer brought stronger or more merited praise than his two large landscapes, then just painted—when he was nearly seventy-nine—and it was in virtue of these landscapes, and of the life devoted to his own ideal in art, of which these were the crowning achievements, that he received his recent souvenir from the best lovers of art in France.

Of that souvenir, and of Corot's own feeling at the reception of it, M. Burty—as I remember—has spoken touchingly. "He is returning"—wrote M. Burty in this very journal, so lately as last December—"he is returning from the country to settle at Paris. He has brought back studies as fresh and as firm as those of his prime. But he is visibly depressed. The death of a deeply-loved sister has been a great blow. Once so active, smiling and chatty, he remains in his chair, with his arms hanging down, speaking of the sad things that await the aged."

That was two months ago; and to-day he is gone—no more "sad things" awaiting him now.

FREDERICK WEDMORE.

THE STUDIOS. II.

MR. BOEHM's studio is, as usual, overflowing with work. A life-size seated statue of Carlyle; a large relief, a memorial to Lord Forrester; a statue of Sir John Burgoyne, destined to be put up on the Military Parade, between the Green Park and the Horse Guards; a rearing thoroughbred, the companion group to *The Horse and his Master*, exhibited last year; and among minor efforts a charming group in low relief, portraits of two sons of Mr. E. Baring. Here too is in progress the somewhat unsatisfactory task of carrying out certain work for the Wolsey Chapel, Windsor, left unfinished at the death of M. de Triqueti. Enlarged repetitions, for instance, have to be executed of two angels, completed by their author, through some miscalculation, on a

scale too small to fill the niches for which they were destined. The rearing thoroughbred commissioned by the Duke of Westminster, which is now just in course of building up, will ultimately be cast in bronze. The statue of Carlyle in terra cotta will probably appear at the approaching exhibition of the Royal Academy. This work is no commission, but a labour in which Mr. Boehm has engaged for his own pleasure. The modelling a small statuette of Mr. Carlyle brought to him so great an interest in his sitter, that he imposed on himself the work of carrying out the larger statue. As a general rule, it is in his smaller work that Mr. Boehm has achieved his best success; but in the present instance the rule seems to have been reversed. Whenever faithful portraiture is the object, the testimony of friends and intimates must always be allowed to have great weight. They know something more of the man than others see, they possess the less broadly obvious, but more complete image of what he is and looks. Those to whom Mr. Carlyle is not fully and accurately known may at once acknowledge the directness with which the artist has seized his conception, and the ease and life with which he has rendered it visible; the judgment of those to whom he stands in close relations fills up the measure of commendation. They are on this occasion unanimous in preferring the large statue to the small statuette. It embodies, they say, for them a moment of expression dear to those who count themselves his friends, a moment which, if not the rarest, is known to be certainly rare, and which shows itself only when he is at ease and happy in his companion. The figure is draped in the long soft folds of a cloth dressing-gown. The head is inclined forward, and turned slightly along with the upper part of the body towards the left; the lower limbs take a contrary direction, the left leg with the left arm resting on the knee being crossed to the right. The attitude, perfectly easy and unconstrained, is not wanting in a certain careless dignity; it suggests the familiar friendliness of even chat, just tempered by the long-standing habit of enforcing opinion. The little relief group of Mr. Baring's sons is also to be carried out in terra cotta. It is one of Mr. Boehm's happiest compositions. The light outline of a tree is indicated on the right. Beneath its branches one of the brothers, who is on horseback, has halted for a moment. He sits at ease half turned round, and talks with the other who stands below leaning against the horse, his left arm thrown caressingly across its neck, his face turned upwards, his right hand thrust partly into his pocket. The design is very graceful, the lines hang well together, and the attitudes and expressions are admirably free and natural.

M. Dalou promises that three works may be ready in next May. A group of two children playing hide and seek behind the trunk of a tree; a peasant woman nursing her baby; and *La Berceuse*, which is being put into marble for the Duke of Westminster. Many will be already familiar with this charming figure rocking lightly backwards in her chair, and enfolding in her arms a sleeping child. The unconscious tranquil grace of pose, the delicate suggestion of passing movement given by the naïve tap of the little foot which shows beneath the gown's edge in front, the skill with which the daily dress of modern life has been induced to yield forms susceptible of artistic treatment, these are points which present themselves obviously even to a careless observer. The mode in which M. Dalou approaches the difficulties of modern costume is alone sufficient to show us the fine quality of his talent. He does not attempt to costume his model—a practice which affords, it is true, an easy escape from imposed conditions, but which generally results in the production of shapes which are without any significance of the necessities born of habits of life and action. M. Dalou accepts the imposed conditions of con-

temporary dress, and then eliminates from it all accidental additions, additions which are not implied by the essential forms. The complexity of dress, which speaks of wealth and idle ease, demands, of course, most imperatively to be stripped in this way, but to some extent the action of this wise power of discrimination is implied in all noble work of portraiture, so that the impression of the most weighty facts, apprehended only by intimate knowledge, may not be trifled away by the crowding variety of subordinate particulars. The first work which gained for M. Dalou a great reputation in this country can have been forgotten by none who saw it: it was a group of a mother nursing her child, exhibited in the Royal Academy Exhibition of 1872. He has again taken as his theme the same motive, and already the incomplete model betrays the presence of the same wonderful charm of expression, the same tender beauty of caressing movement which distinguished the earlier work. But the group which he is now carrying out differs completely from that which excited so much sympathetic admiration in 1872. The bare arms, the uncovered head of the mother in the first group, the pleasant freedom of her clasping touch hinted to us of the safe and careless exposure of summer days; the mother whom we now see is closely shrouded in thick and heavy garments. Her high cap sits firmly about her face; she draws the long folds of her winter cloak about her. She shelters the child at her breast; her head is bowed over the little form she holds in a movement specially full of the infinite care of love. *Hide and Seek* is yet another example of the happy instinct with which M. Dalou seizes on the action which most intimately corresponds to the mood of sentiment which he wishes to express. The two children almost tremble with the delightful excitement of their play; the girl presses hard against the tree-trunk which separates her from her brother, and grasps her gown tight with nervous eagerness; the little brother peeps, and almost sees her from the other side. A single impulse binds together the little group, the image rises before us complete in itself, quick with gay decorative motive just as M. Dalou received it from the children themselves; playing brave, and glad with childish joy, even within the oppressive circle of thronged streets, overshadowed by thick air. Among numberless sketches recently thrown off by M. Dalou, there is one especially which it is to be hoped he may find opportunity to work out. *The Bathers* is a group of two figures, one undraped. The half-startled movement of this figure towards her companion is very happily found. And besides the promise of charm and beauty given by the group, it seems as if even for one so gifted as M. Dalou there might be danger in too constantly dwelling on clothes; it must always be desirable that some work from the undraped model should be now and again interposed, lest sense of the forms which lie beneath them should become less vivid.

E. F. S. PATTISON.

NOTES AND NEWS.

MR. McLEAN has at present on view, among other pictures of a certain interest, a good specimen of Israel's work. It does not present the same elements of pathetic story which appeal to the popular sympathies in most of M. Israel's familiar productions; but he is on that account rather more than less agreeable than usual. The artistic power which he really possesses makes itself the more prominently evident. The background of the scene is filled by long waving lines of blown sand heaps, thinly covered by the growth of reedy grass. The poverty of nature is responded to in a chill veil of grey cloud which settles down from the sky, creeping slowly near, and already hiding the more distant forms from sight. A woman moves steadily with an air of weary resolution across the midst. She is followed by a dog who drags heavily after him the little cart in

which she has placed, nestled among her small purchases and household provisions, her sleeping child. Colour and interest are skilfully centred in the homely figure of the mother, and she passes on, the wheels of the poor cart rolling after her, with something of the serious dignity of a solemn procession.

THE ornamental property of the late Earl of Dalhousie was sold on the 17th at Messrs. Christie's. A Neapolitan cabinet, with Pompeian subjects, sold for 22*l.*; an ewer, *Triumph of Bacchus*, 12*l.* 10*s.*; a pair of fine cisterns of Oriental porcelain, richly painted with birds and flowers, 383*l.* 5*s.*; an Indian scent-bottle, of rock crystal, 25*l.* 10*s.*; a rock crystal cup, in form of an eagle, 25*l.*; a bottle, formed as a tortoise, 19*g.*; an ivory tankard, with Bacchanalian subjects, 90*g.*; another, *Feast of the Gods*, 58*l.*; circular salver, engraved with scrolls, &c., *temp.* Queen Anne, 265*l.*; a pair of Vernis Martin vases, painted with Cupids and mounted in silver, 100*g.*; rock crystal tazza, 50*g.*; an oval mirror, silver frame, 90*l.* 6*s.*; a black wood casket, enriched with silver ornaments, 80*g.*; silver rosewater dish, *Judgment of Paris*, 120*l.*

MR. GILBERT BURLING, an American artist who had acquired considerable reputation in his own country, although but little known in this, died recently, at the early age of thirty-three. Mr. Barling was one of the founders of the American Water-Colour Society, and acted for some time as its secretary. At the breaking out of the American war he entered the United States navy, and served as a lieutenant for several years. Ill health, however, compelled him to resign this position, and he returned to his pursuit of art, and soon became prominent as a water-colour painter. He did much to popularise that branch of art in America, and several of his paintings are at present being exhibited at the Academy Gallery in New York.

THE *Levant Herald* of the 10th inst. announces that a search is now being made for antiquities by order of the Government in the plain of Cyzicus, on the Asiatic coast of the Sea of Marmora. The excavations commenced on the previous Friday, and it is hoped that many archaeological treasures may be brought to light from the site of the old Milesian colony.

A GREAT National Museum is about to be created at St. Petersburg. The *Fédération Artistique* states that foreign as well as native architects have been invited to send in plans for competition in the building.

THE exhibition of the "Cercle de l'Union Artistique" is now open, and is reported to be of even higher merit than usual. It is chiefly remarkable by its portraits, among which those by Carolus Duran and Jalabert of course attract the greatest attention. Both these popular artists have contributed full-length portraits of ladies.

M. RENÉ MÉNARD has retired from the editorship of the *Gazette des Beaux Arts*, or rather it would seem as if the *Gazette* had retired from his editorship. M. Louis Gonse, a well-known contributor, takes his place.

THE opening of the Salon of this year will take place on June 1. Contributors are requested to send in their works from March 8 to 18.

THE "Cercle Artistique et Littéraire" of Brussels has formed a collection of the works of Frédéric van Kerckhove, the wonderful child-artist, of whose life and early death we gave a short account in the ACADEMY some months ago. More than 200 landscapes painted upon wood, many of them of large size, have been executed by this unfortunate child, who paid the penalty of his precocious development by dying before he was eleven years old. The Brussels papers speak in the highest terms of praise of his artistic powers. It is said that in most of his landscapes he has represented

a running stream of water, and himself loitering or fishing on its banks.

THE French School of Mosaic, which we mentioned in a previous number as proposed to be established at Sèvres, is not, it seems, such a novel idea as at first supposed. In a letter to the *Chronique* of February 20, M. Héron de Villefosse points out that Napoleon I. formed the same project, and actually carried it into execution. His aim, however, was not only to naturalise a useful and splendid art in France, but was also connected with a charitable object, namely, to find employment for deaf and dumb artisans. The budget of 1807 shows that a sum of 10,000 fr. was voted for such an establishment, of which 1,200 fr. was devoted to engraving on precious stones, and the rest to the instruction of deaf and dumb pupils in an Imperial School of Mosaic. A Roman sculptor named François Belloni was the first director of this school, but owing to want of funds and other difficulties the scheme languished, and never produced any useful results. The mosaic from Gérard's picture of Napoleon I. as a victorious Minerva leading Peace and Abundance, that now hangs in the Salle Melpomène, in the Louvre, was executed, it is supposed, under the auspices of Belloni. Subsequently, it was proposed to establish the School of Mosaic at Sèvres, and to make it more a manufactory than a school; but this does not seem to have been carried out.

IN the form of a verbatim report of a lecture given a few weeks ago in Paris at the Cercle de la Librairie by M. Gaston Tissandier, there may be found, in the pages of the *Chronique du Journal Général de l'Imprimerie et de la Librairie*, a readable history of the art of wood-engraving from its earlier days in Germany, the Low Countries, and Italy, to its revival in England just a century ago, by Thomas Bewick, known to everyone by one of his later works, *The History of British Birds*.

THE project of a National Academy of French Artists, proposed by M. le Marquis de Chennevières, Directeur des Beaux-Arts, in January of last year (see ACADEMY, January 24, 1874), has not as yet been carried out, in spite of the enthusiasm with which it was at first received. French artists, it seems, have been so long accustomed to have their affairs managed for them by the State, that, unlike Frenchmen in general, they scarcely care to involve themselves in the difficulties of self-government. The proffered liberty involves a vast amount of work and responsibility, and so long as they can have their Salons and their awards easily regulated for them by Government, they will not take the necessary steps towards reform—such of them, at least, as have already arrived at eminence under the present system; and as to others who might hope to benefit by a change of rule, they are scarcely powerful enough to organise it. It was decreed last month that the regulation (*règlement*) of the Salon of this year should be left to the National Academy; but as no Academy has been formed, M. de Chennevières has found it necessary to publish the Government *règlement* for the Salon just as usual. This *règlement* was at first only provisional, in order to give the artists a chance of associating before January 15. This time having passed, and nothing having been done, the Government *règlement* has, of course, become compulsory.

The project, however, of a National Association of French Artists is by no means given up. At a recent meeting held by the delegates of the French artists, under the presidency of M. Labrousse, it was resolved that, although for the present it was impossible to enter upon projects that necessitated the entire unanimity of all those who were interested, still the commission held itself bound to seek to establish the legal existence of an indeterminate number of artists who might desire to associate for the development of resources and advantages that they could not

find in isolation. Such a society, however, would be very little more than a private co-operative society, a scheme that has been already tried in a small way among artists in Paris. It lacks altogether the dignity of a national undertaking, but while there are so many different views and interests among French artists, probably the Government tyranny, as it has been considered, is more conducive to the interests of art than any self-governed academy. Eugène Véron, writing on the subject in the *Chronique*, proposes that the Government should threaten to suppress the Salon of 1876 altogether, unless organised by the Academy. With this warning, he has no doubt but that "l'association se serait faite comme par enchantement."

It is announced that Pius IX. desires to adorn the exterior of the dome of St. Peter's with twelve colossal statues of the Apostles, conformably to the supposed intention of Buonarroti for the completed structure which he did not live to see. His Holiness purposes to give the commission for these statues to twelve Roman sculptors settled in the city before the fatal 20th of September, 1870, and who have not in any way submitted to, or made common cause with, the new authorities. A visit made to St. Peter's, the other day, by the Pope, which has been much commented on, as he thereby broke the spell of his self-imposed imprisonment, seems to have been with the sole object of contemplating for the first time his own portrait in mosaic, a large medallion head with an epigraph in gilt letters below, placed above the ancient bronze of the seated St. Peter, in commemoration of the completion of Pius IX.'s twenty-fifth year in the Pontificate.

It is believed that the well-known and learned Signor Fiorelli, long the superintendent of all works at Pompeii and Herculaneum, may be induced to quit Naples and undertake the direction of the *scavi* now in progress on different sites in Rome. This request was, we understand, some weeks ago made to him by the authorities, but at first refused on the plea of his unwillingness to quit a sphere of duties in which he has indeed made himself indispensable. But this removal from Naples to Rome is still urged upon him.

THE British Academy in Rome has applied to our diplomatic minister, Sir Augustus Paget, requesting him to obtain the sanction of our Government for negotiating with that of the Italian Monarchy to secure the desirable object of the purchase of a now vacant convent, with gardens and spacious premises, in a street on the ascent of the Pincian Hill; and some liberal benefactors, including Mr. Allan Fraser, offer to lend the Academy, at once, the entire sum requisite, to be reimbursed as may be convenient in the future. The Academicians greatly desire to effect this purchase; the *locale* actually in use for their schools, library, and reading-rooms being insufficient.

A MAGNIFICENT centre-piece in silver gilt, the work of the celebrated Nürnberg goldsmith Wenzel Jamitzer, has recently been acquired by the energetic director of the Germanic Museum. This centre-piece had been long treasured in the old Nürnberg family of Merkel, but when the banking firm of Herrn Loedel and Merkel stopped payment a short time since, it was supposed that this with other artistic treasures would be sold. The supposition attracted numerous antiquarians, dealers, &c., to Nürnberg, but happily it was found that all the art wealth of this ancient family was protected by a trust. The trust, however, permitted of the whole of the property being placed in the Germanic Museum for "the use and instruction of the public," and this has accordingly been done. Beside this rare and beautiful centre-piece by Jamitzer, the Merkel collection contains about 300 Dürer engravings, Payer's portrait collection, 1,700 important manuscripts among them,

a sheet by Dürer, and many other valuable and interesting curiosities.

THE model of the magnificent Corona or light-bearer of Hildesheim Cathedral, mentioned some time ago in the ACADEMY as having been most admirably executed by Herr Küsthardt, has recently been set up in the new court of the South Kensington Museum. This remarkable example of early metal work was executed, it is affirmed, during the period when Azelinus and Ethylo, successors of St. Bernhard, were bishops of Hildesheim—that is to say, between 1044 and 1079. Several such works date back to the same time, and it is thought that they were meant, by their towers and battlements, to bear reference to the Heavenly Jerusalem. The Hildesheim corona measures twenty feet in diameter, and is altogether one of the finest specimens of its kind. It is composed of twelve broad bands of gilded metal, each forming the segment of a circle; at the points where these segments join are placed large and richly ornamented open towers, with a small lantern at the top to hold a candle. These towers formerly held statuettes in silver representing Old Testament characters and personifications of the virtues, but these have long since disappeared. In each of the twelve bands also is a niche, in which, no doubt, there was placed a statuette of an apostle, for the names are still found written underneath, though the niches are now empty. This huge chandelier held about seventy-two lights, and was suspended to the roof by strong iron chains uniting in a gilt apple at the top.

THE STAGE.

MISS LITTON was to take her benefit last night at the Court Theatre, appearing as Nan, in *Good for Nothing*—a marked character, her performance of which would at least be sure to be interesting. Miss Litton and her company go immediately to the Standard Theatre for a three weeks' "starring" engagement, and on their return to the West End will appear at the Saint James's—Mr. Hare having possession of the Court. The laughable piece known here as *Brighton* will probably serve them to begin with at the Saint James's; but Mr. W. S. Gilbert has written a fanciful comedy, which will be produced at an early date.

A PERFORMANCE of an unusual kind took place at the Gaiety on Wednesday morning, when Mrs. Fairfax—a lady who has before appeared at that theatre—gave a selection of scenes from *Romeo and Juliet*, *Macbeth*, and *The School for Scandal*. She was assisted by Mr. Horace Wigan, Mr. Charles Warner, and Mr. Creswick. Miss Edith Wynne was engaged to sing some of Shakspeare's songs, between the scenes.

THE date of the benefit performance for Mr. Hingston is changed, the *Observer* says, from March 4 to 18. Many excellent artists have offered their services on the occasion.

Money was played last Tuesday at the Crystal Palace, and the cast, as far as the men were concerned, was undoubtedly a strong one, for it included Messrs. Herman Vezin, David James, Charles Wyndham, Charles Sugden, and others. Miss Oliver gave great character and colour to the part of Lady Franklin, naturally rather pronounced, yet apt to be effaced by inadequate actresses. Miss Carlotta Addison was a pleasant, though not a strong Clara Douglas, and Miss Emily Duncan looked more than all that was required, as Georgina. It is an excellent thing for the people of Sydenham that these performances take place down there; but it would be still better for Londoners if the like of them could take place in Town, where facilities for complete, that is elaborate, rehearsals, would be at the command of the very excellent artists habitually engaged.

MR. EDWARD SWANBOROUGH takes his Benefit at the Strand Theatre on March 4.

THE company secured by Mr. John Hare for his opening of the Court Theatre, this day fortnight, is of unusual excellence, as anyone will see who reads the list of the artists engaged. Much may be hoped of a performance in modern comedy in which Mr. and Mrs. Kendal, Miss Amy Fawcett, and Mr. John Clayton are engaged.

Mlle. SARAH BERNHARDT and M. Laroche have been elected *sociétaires* of the Théâtre Français. The election of Mlle. Bernhardt had all along been sure, and M. Laroche had recently added to his distinctions and his claims.

M. GEORGES RICHARD, and a comrade at the Odéon, are engaged in writing a history of that theatre.

M. LEGOUVÉ's lectures on Samson and his pupils, which appeared in full in *Le Temps*, and from which we gave extracts two or three weeks ago, in these columns, have been republished in a small book.

M. BRESSANT was to reappear at the Théâtre Français on Thursday, in Scribe's *Verre d'Eau*—the well-known comedy treating of the Court of Queen Anne and of the character of Marlborough.

Nos bons Villageois, by Sardou, was to be reproduced at the Gymnase on Tuesday.

THE production of M. Delpit's *Jean-nu-pieds* at the Théâtre de l'Ambigu has been postponed till September, owing to the amazing success of *Rose Michel* with M^{me}. Fargueil.

Two little pieces brought out lately at the Odéon do not call for lengthened comment. *Nos Lettres* is the less important of the two. The other one, called *Le Troisième Larron*, is by a young poet, M. Jacques Normand. It has pretty little passages and ease of versification, but it does not prove that its author is capable of substantive work. What it does prove is that he is a young man of pleasant imagination, and that he is desirous of some day producing something which may claim to be criticised.

FIRST nights are not very frequent at the Théâtre Français, and the first night of *La Fille de Roland* was an important one. The new work of M. Henri de Bornier is spoken of as a "drama in verse;" but in this case the drama in verse is almost a tragedy. The taste for serious drama, it is generally remarked, is reviving in France, and to this, as well as to its own merits, the success of *La Fille de Roland* is due. We shall have another opportunity of speaking of the literary qualities of the work. Here, however, its story may be told with the utmost brevity. Its period is the period of Charlemagne, and the love of 'Gerald, the son of the traitor Ganelon, for Berthe, the niece of Charlemagne, is a pure one. Having saved her life from the hands of the Saxons, he falls in love with her. Charlemagne bids him to his court, whither, however, he is forbidden to go, by his father, who now goes by the name of Amaury, and fears that his hiding place will be discovered. A love-scene between the two young people is spoken of as of marked excellence. Amaury joins the couple, and at the end of the second act, Gerald, a knight-errant, sets forth on his adventures. At Aix la Chapelle—at the Imperial Court—a noted Saracen, who, armed with the famous sword of Roland, has killed thirty French barons in a month, beards Charlemagne himself. But Gerald fights the Saracen and conquers him, and Berthe's hand is given him as his reward. But Amaury (or Ganelon) has followed his son to Aix, and there is recognised by Charlemagne, and thence by Charlemagne banished to the Holy Land. Gerald and Berthe, about to be united, are dismayed by the arrival of a Saxon prisoner, who announces whose son the bridegroom is, and this announcement having been made, Gerald will not disgrace his love with the alliance. She will get her "to a nunnery," and he will go to the wars, and Charlemagne acquiescing in this decision, the play, in this wise, ends. But of course its

literary qualities are by no means to be suspected from this faint outline of its plot. The acting is pronounced to have been in the main such as the Théâtre Français has accustomed us to expect. No one was more remarked than M. Laroche, who appeared as the unwelcome Saxon—Laroche had that morning been elected a *sociétaire* of the Theatre. His wild get-up, his rapid and hissing utterance, and his decided and brusque gestures, were found to be well-chosen and arranged for the part. M. Mounet Sully gave to the character of the son all the impetuosity it needed, and by this performance has confirmed the reputation previously made, without exactly extending it, by giving any evidence of new powers. M. Dupont-Vernon, a most conscientious and painstaking artist, with unhappy defects of voice and appearance, represented the father Amaury de Ganelon, and M. Maubant was Charlemagne. He has been accused of making his Charlemagne too old, but a good critic has pointed out that after all he has but followed the indications of the author, who has represented the monarch "pleurant sur l'impuissance de ses fils à soutenir le fardeau qu'il va bientôt leur léguer. As the heroine, Mlle. Sarah Bernhardt had not very much to do, and opinions are divided as to how she did it. One of her critics says "she is a true woman indeed, but can never be a heroine of tragedy." Another—M. Sarcy, who, to do him justice, is not easily wearied in singing her praise—says, "elle a trouvé dans le second acte des accents d'une tendresse inexprimable et d'une fierté héroïque."

A CORRESPONDENT of a theatrical paper complains of the absence of farces from our play-bills, but on the whole he is without full ground for his complaint. There are farces played nightly at several of the London theatres; one at the Lyceum, for instance, in which an actor of great repute appears every evening. But comedietta and burlesque—not to speak of operabouffe—have, he appears to think, driven farce off the stage. They have no doubt limited its area, and this he regrets. He avers also that better farces would be forthcoming if the managers paid a good price to the writers of them, and made them what they used to be, more prominent features in the evening's entertainment. But à quoi bon? one may ask. You cannot, it is true, dispute about taste, but for our own part, when we have chanced to witness many old farces, we have wondered what there was to laugh at in them. A few farces written twenty years ago have still the right to hold the stage, and a few of that much older time which was really the palmy time of farce-writing. But in each case very few. And twenty years ago, when farces certainly were represented more universally than now, people must have been quite exceptionally happy, to laugh so easily. *High Life Below Stairs*, *Raising the Wind*, and *Box and Cox*, and a few others, have still some life in them, but we doubt whether the art of farce-writing will ever revive, or if it could revive with much advantage to us. Its material is necessarily limited, and is perhaps well-nigh used up.

MUSIC.

MONDAY POPULAR CONCERTS.

THE chamber-music of Brahms seems to be steadily, though slowly, making its way into our programmes. True, only a comparatively small portion has as yet been heard here, and his two trios, his violoncello sonata, and his solo sonatas are still entirely unknown to concert-goers in this country. But his two pianoforte quartets have been repeatedly brought forward, and have at every fresh hearing been more highly appreciated. Last Monday night's concert at St. James's Hall opened with his great Sextett in B flat, Op. 18, for stringed instruments. This work was no novelty at these concerts, the present being its fourth performance; but as a thoroughly repre-

sentative specimen of its composer's best style, and as I have not previously had occasion to speak of it in these columns, some notice of it may be interesting to our readers.

The sextett is written for a somewhat unusual combination—two violins, two violas, and two violoncellos. I believe I am correct in saying that this combination was first employed by Spohr in his sextett in C, Op. 140. I am not aware that any composer has since used it until Brahms did so in the present work, and subsequently in a second Sextett (in G, Op. 36), which was performed some little time since at one of Mr. Henry Holmes's "Musical Evenings." The prolific Joachim Raff has also written a sextett for the same instruments, which was noticed in this paper last year (ACADEMY, August 8, 1874). The employment of two violoncellos greatly increases the resources at the disposal of the composer, by giving him the opportunity (of which, by the way, Brahms has availed himself largely), of treating the first as a solo instrument, while the second forms the foundation for the accompanying harmonies.

A marked feature of the Sextett in B flat is the indefinable, yet clearly appreciable, unity of style which pervades it. The four movements of which it consists are, to use a homely phrase, "all of a piece." This characteristic is observable in the greatest (and only in the greatest) music. For instance, one cannot but feel that the slow movement of Beethoven's C minor symphony would be out of place in the "Eroica," and *vice versa*. There is an internal connexion between the various parts of the works which has been compared to that existing between the acts of a drama. The one is the logical consequence of the other. One cannot define how or why this is; one can only feel it; and the composer, if he conceive his work as a whole and not in fragments, will produce on his hearers the impression of unity referred to.

Another characteristic of the present composition is a kind of dreamy romanticism in the principal themes. This is most noticeable in the first and last movements, but it makes itself felt to a greater or less extent in all its composer's more important works. It is in this, more perhaps than in anything else, that the individuality of Brahms's genius consists. Such themes as the second subject of the first *allegro*, and both the chief subjects of the *finale* are the distinct outcome of the composer's personality. They remind one of Beethoven in their breadth of style, yet one feels at once that they are not Beethoven's, though his spirit seems to have passed over them; they occasionally also suggest Schumann, yet with a difference. It might perhaps be said that Brahms has absorbed into himself the essence of these two composers, and that his style has been tinged by that of his great predecessors without losing its originality. This originality is, however, occasionally carried to the verge of the *bizarre*, as in the close of the theme which forms the subject of the variations in the second movement. Here the abrupt modulations introduced have a harsh and strained effect, as if the composer were determined at all costs to say something which had not been said before.

Brahms is not free from the besetting sin of the modern German school—diffuseness. One cannot help feeling that the developments of the first and last movements, though full of interesting and charming matter, are too long, not so much as regards the absolute number of bars, but as regards the comparative length of the music to the importance of the ideas to be treated. This diffuseness is, however, less noticeable here than in some other of the composer's works, such, for instance, as the concerto played at the Crystal Palace on Saturday, or parts of the "Deutsches Requiem." The only concise portion of the present work is the *scherzo*; and this, while the most popular in style (it was tumultuously encoored on Monday night), is decidedly the least original of the four

movements, being merely a reproduction (though, be it said, without plagiarism) of the typical Beethoven *scherzo*.

In spite, nevertheless, of some defects, the Sextett as a whole is a masterpiece; and never probably has it received a finer rendering than on Monday night from Messrs. Joachim, Ries, Straus, Zerbini, Piatti, and Daubert. Herr Joachim and Signor Piatti especially in the arduous parts of first violin and first violoncello were above all praise, and they could not have been more admirably supported than they were by their colleagues. The *scherzo*, as above mentioned, was redemanded, and the performers recalled at the end of the work.

A few lines must suffice to record the rest of the concert. The pianist of the evening was Mr. Dannreuther, who gave an excellent rendering of Beethoven's Sonata in A, Op. 101, and joined Herr Joachim and Signor Piatti in Schumann's "Fantasie-stücke" for piano, violin, and violoncello—not one of the composer's greatest works, though containing many interesting details. The vocalist was M^{me}. Otto-Alvsleben, who gave in her true artistic style songs by Rubinstein and Volkmann; and the concert concluded with Haydn's quartett in D minor, Op. 76, No. 2.

EDENEZER PROUT.

IN consequence of the length to which our notice of the Monday Popular Concert has extended, we must dismiss last Saturday's Crystal Palace Concert far more briefly than it deserves. Its most important feature was undoubtedly M^{lle}. Krebs's magnificent performance of Brahms's Pianoforte Concerto in D minor. This very interesting work had only once before (we believe) been played in England—at the Crystal Palace on March 9, 1872, by Miss Baglehole. The first movement, though in parts obviously suggestive of Beethoven's ninth symphony, is full of charm, and the *adagio*, while somewhat diffuse, is marked by the romantic tone spoken of above as one of Brahms's characteristics. The *finale* is on the whole the most effective movement of a work which may rank among its composer's best efforts. The solo part, which is of enormous difficulty, was played from memory by M^{lle}. Krebs with a perfection which absolutely left nothing to desire. Never, probably, has finer playing been heard. In addition to the concerto, the programme (which, for once, was judiciously short) included Schubert's unfinished symphony in B minor, played by the orchestra under Mr. Mann's direction with a finish that has rarely been equalled and never surpassed, even by the Crystal Palace orchestra, Mozart's overture to the *Seraglio*, and a Festival Overture entitled "From Rhine to Elbe," by Herr Krebs, the father of the distinguished young pianist. The overture, which is largely founded on the choral "Nun danket alle Gott," is very cleverly written, and effectively, though somewhat noisily scored. The vocalists were M^{me}. Patey and Mr. Edward Lloyd, neither of whom needs praise in these columns. This afternoon an important work by an English composer—Mr. Alfred Holmes's dramatic symphony "Jeanne d'Arc"—is to be performed, for the first time in this country.

THE prospectus of the coming season of the Philharmonic Society has been issued, and contains a goodly promise of novelties. Chief among these is Raff's "Im Walde" symphony, announced as for the "first time in England." We may be mistaken, but we are under the impression that Mr. Hallé produced the work some time since at Manchester. Other works promised for the first time are Lachner's Suite in D, one of Rubinstein's symphonies, Brahms's Variations on a Theme by Haydn, Schumann's overture to *Die Braut von Messina*, Spohr's overture to *Der Zweikampf*, Wagner's introduction to *Tristan und Isolde*, and the same composer's "Huldigungsmarsch." In addition to other works not often performed, it is also announced that Mr. G. A. Macfarren has accepted a commission to write an orchestral work

for the society—of what kind is not stated. At the first concert, on March 18, Bennett's *Woman of Samaria*, and some of his *Ajar* music is to be given.

MR. WILLEM COEKEN announces three concerts of modern music to be given at St. George's Hall during the coming month. The new works to be brought forward are—at the first concert, Raff's Trio in C minor, Brahms's String Quartett in A minor, and A. C. Mackenzie's Piano Quartett in E flat; at the second, Gernsheim's Piano Quartett in E flat, Brahms's Sonata in E minor for piano and violoncello, and Svendsen's Octett for strings in A, which was produced with such success last year; and for the third, Svendsen's String Quartett in A minor, Raff's Sonata in E minor for piano and violin, and Brannbach's Piano Quartett in E flat. An interesting selection of vocal music will also be given.

MR. WALTER BACHE's concert took place on Thursday night at St. James's Hall, too late for notice in this number. We shall speak of it in our next issue.

THE series of concerts given by the Glasgow Choral Union was brought to a close on the 15th inst. by an excellent performance of the *Creation*. We regret to learn on good authority that they have financially resulted in a loss, as they have been from a musical point of view most admirable. From an abstract of the performances we find that five important vocal works have been given—the *Messiah*, *Creation*, *St. John the Baptist*, *Smart's Jacob*, and Brahms's "Song of Destiny;" while at the orchestral concerts twelve symphonies, twenty-three overtures, and a very large number of miscellaneous pieces have been produced. We trust that the committee of management will not be disheartened by their first failure; if they continue as they have begun, success, though it may be deferred, is ultimately certain.

MDLLE. MARIE KREBS announces two pianoforte recitals at St. James's Hall, to be given on the 3rd and 10th of the coming month.

MR. JOHN CROWDY has resigned the editorship of the *Musical Standard*.

THE death is announced from Paris of Berthold Damcke, an excellent musician well known on the continent, though his name will probably be unfamiliar to most of our readers. He was a pupil of Ferdinand Ries and Aloys Schmitt. He resided for many years in St. Petersburg, but removed in 1859 to Paris, where he thenceforth resided. At the time of his death he was joint-editor of the new and superb edition of Gluck's operas now in course of publication.

ST. DAVID'S DAY will be celebrated by a Welsh Festival Concert at the Royal Albert Hall, on which occasion the members of the Principality residing in London and the suburbs will have a thoroughly national programme presented to them. Miss Edith Wynne, Miss Lizzie Evans, Miss Marian Williams, Miss Mary Davies, Mdme. Patey, Mr. Edward Lloyd, Mr. Ap Herbert and Mr. Lewis Thomas are announced as vocalists; Miss Bessie M. Waugh, Mr. W. H. Thomas and Mr. Brinley Richards presiding at the pianoforte. A band of harps, under the direction of Mr. John Thomas, will also assist, and the Part-song Choir of the Royal Albert Hall Choral Society, under Mr. Barnby's direction, will contribute Welsh choruses and part-songs. The next Popular Ballad Concert at the Royal Albert Hall is to take place this evening, with Mdme. Lemmens-Sherrington, Miss Edith Wynne, Miss Antoinette Sterling, Mr. Edward Lloyd and Mr. Thurley Beale as vocalists.

THE constitution of the grand orchestra for Wagner's Bayreuth performances next year will be as follows:—16 first and 16 second violins, 12 violas, 12 violoncellos, 8 double-basses, 3 flutes, 1 piccolo-flute, 3 oboes, 1 corno inglese, 3 clarinets, 1 bass-clarinet, 3 bassoons, 4 horns, 2 tenor and 2

bass tubas (the players on which instruments will also on occasion take four more horns, making in all eight), 3 trumpets, 1 bass-trumpet, 3 trombones, 1 contrabass-trombone, 1 contrabass-tuba, 2 pairs of drums, 7 harps, and percussion instruments, such as cymbals, triangle, tamtam, side-drum, &c.

POSTSCRIPT.

"AN Oxford M.A." writes us the following letter on a matter which we are very glad, for the credit of the University, admits of a satisfactory explanation:—

"In reference to your notice of the Leyden tercentenary, and the fact that Oxford had neither sent representatives nor replied to the courteous invitation of the Dutch University, let me inform your readers of the following facts.

"The invitation was received in the second week of December by the Vice-Chancellor of the University of Oxford (Dr. Sewell), who was at the time seriously ill.

"In the ordinary course of events it would have been brought by him before the Council of the University. In consequence of his illness it was handed to the secretary of the Council, in order that it might at once be brought under consideration.

"The secretary did not bring it under the notice of the Council, and it was not until your account of the Leyden proceedings was published that the fact of an invitation having been sent was known even to the members of the Council, still less to other members of the University.

"In consequence of the facts which have now been brought to light, the Vice-Chancellor has written an official letter of apology to the University of Leyden; and the clerk through whose negligence the University has been placed in this awkward position is to be discharged from his office."

GOLDSMITH'S *She Stoops to Conquer* is being acted at Copenhagen in a Danish translation of 1785, and with immense success, under the title of *Fejlgælselserne*, or "The Mistakes."

PROFESSORS BAIN AND CROOM ROBERTSON have written to us to say that our paragraph on the new psychological periodical has led to a false impression in some readers, that the former of these gentlemen had a larger hand in its organisation than he really had.

MUSIC NOTES, POSTSCRIPT, and TABLE OF CONTENTS	231-2

NEW WORKS.

FRASER'S MAGAZINE, New Series, No. LXIII. MARCH, 1875. Price Half-a-Crown.

CONTENTS:—

Early Kings of Norway.—Chapters XI. to XVI. German Home Life. By a LADY.—III. Food. The Place of Stenardale Bennett in Music. Sidgwick's Methods of Ethics. By LESLIE STEPHEN. Recollections of the Stage. By Major NOEL. Some Political Aspects of Sir Samuel Baker's Expedition. The Historical Manuscripts Commission. By JOHN PROCTOR, F.S.A. The Dangers of the Sea. By the CAPTAIN of an OCEAN STEAMER. The Literary Character of the Fourth Gospel. A Rejoinder on the Debts of New Zealand. By CHARLES FELLOWES. Charles Kingsley. By RICHARD JOHN KING.

GENERAL VIEW OF POSITIVISM and INTRODUCTORY PRINCIPLES. By AUGUSTE COMTE. Translated by J. H. BRIDGES, M.B., formerly Fellow of Oriel College, Oxford. 8vo, 21s. *Being the First Volume of COMTE'S "System of Positive Polity, or Treatise on Sociology," to be completed in Four Volumes, published separately, and each forming in some degree an independent Treatise:—

VOL. II. THE SOCIAL STATICS, or the Abstract Laws of Human Order. Translated by FREDERICK HARRISON, M.A. of Lincoln's Inn. [In May.]

VOL. III. THE SOCIAL DYNAMICS, or the General Laws of Human Progress (the Philosophy of History). Translated by E. S. BEESLY, M.A., Professor of History in University College, London. [In September.]

VOL. IV. THE SYNTHESIS of the FUTURE of MANKIND. Translated by RICHARD CONGREVE, M.A., M.R.C.P., formerly Fellow and Tutor of Wadham College, Oxford; and an APPENDIX, containing the Author's Minor Treatises, translated by HENRY DIX HUTTON, M.A., Barrister-at-Law. [Before Christmas.]

STUDIES from GENOENSE HISTORY. By Colonel G. B. MALLISON, C.S.I., Guardian to His Highness the Maharaja of Mysore. Crown 8vo, price 10s. 6d.

DOWN the ROAD; or, Reminiscences of a Gentleman Coachman. By C. T. S. BIRCH REYNARDSON. With Twelve Chromolithographs from Original Paintings by H. Alken. Medium 8vo, 21s.

HERE and THERE AMONG the ALPS. By the Hon. FREDERICA PLUNKET. Fcap 8vo, with Vignette, price 6s. 6d.

THREE ESSAYS on RELIGION: Nature; the Utility of Religion; Theism. By JOHN STUART MILL. Second Edition. 8vo, price 10s. 6d.

Dr. TYNDALL'S BELFAST ADDRESS. Eighth Thousand, with a New Preface and the Manchester Address. 8vo, price 4s. 6d.

THE PRINCIPLES of ECONOMIC PHILOSOPHY. By HENRY DUNNING MACLEOD, M.A. Trin. Coll. Cam. Second Edition. VOL. II. PART I. (Completing *Pure Economics*). 8vo, price 12s.

DAVID HUME'S PHILOSOPHICAL WORKS. Newly edited, with Preliminary Dissertations and Notes, by T. H. GREEN, M.A., Fellow and Tutor, Balliol Coll. Oxford, and the Rev. T. H. GROSE, M.A., Fellow and Tutor, Queen's Coll. Oxford. 6 vols. 8vo, price 56s.

THE PHILOSOPHY of MODERN HUBBUB. 8vo, price 7s. 6d.

FASTING COMMUNION, how Binding in England by the Canons. By the Rev. H. T. KINGDON, M.A. Second Edition. 8vo. [Nearly ready.]

AN EXAMINATION into the DOCTRINE of CONFESSION. By the Rev. W. E. JELF, B.D., sometime Student of Ch.Ch., Author of "Queneau." 8vo, 7s. 6d.

DISEASES of the KIDNEY and URINARY DERANGEMENTS. By W. H. DICKINSON, M.D., Physician and Lecturer on Pathology, St. George's Hospital. Second Edition. PART I. *Diabetes*. 8vo, with illustrations, price 10s. 6d.

CONSUMPTION and TUBERCULOSIS: its Proximate Cause and Specific Treatment by the Hypophosphites, upon the Principles of Stenochological Medicine. By J. F. CHURCHILL, M.D. Paris. 8vo, 21s.

STONEHENGE on the GREYHOUND: a Treatise on the Art of Breeding, Rearing, and Training Greyhounds for Public Running. New and Improved Edition, with Portraits of Greyhounds, &c. Square crown 8vo, 12s.

London, LONGMANS & CO.

SATURDAY, MARCH 13, 1875.

No. 149, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Encyclopaedia Britannica. Ninth Edition. Vol. I. (Edinburgh: Adam & Charles Black, 1875.)

To write an adequate review of an Encyclopaedia would manifestly be beyond the powers of any modern critic, however plausible might be his pretensions to universal knowledge: but nevertheless it ought to be possible, without incurring the imputation of impertinence towards those distinguished persons who have offered to contribute to this publication from the stores of their own special knowledge, to write a modest notice of the present volume, contrasting it with its predecessors in respect of its general plan and execution.

The prefatory notice by Professor Baynes expresses in well-chosen language the special character which has during the last sixty years distinguished the *Encyclopaedia Britannica* from other similar works; and inasmuch as this first volume of the new edition, which concludes with the article "Anatomy," may reasonably be taken to be a fair sample of the whole, it is less difficult than might at first be supposed to enquire how nearly the actual work approaches the high standard which he has laid down. The last edition, which had been eight years in course of publication, was completed just fifteen years ago; but the edition which preceded that—i.e., the seventh, which throughout bears the date of 1842—is the one which has been chiefly chosen by us for comparison with the present, because in itself it formed a more definite advance upon its predecessors, and also because it marks a period of more convenient length for our purpose. The period which has been thus selected for comparison represents just the lifetime of one generation; but in the domain of the physical sciences it marks, as Professor Baynes has concisely indicated, a progress in conception, classification, and terminology which is almost equivalent to a revolution; while in all those other departments of accurate and useful knowledge which are traditionally comprehended within the limits of an encyclopaedia, progress also has been made of scarcely inferior importance, which it is not so easy to characterise, and which therefore runs the risk of being overlooked. It so happens that this first volume does not comprise its proportionate share of those alphabetical headings which are associated with the most striking achievements of modern science, and consequently our criticism on this occasion will be mainly devoted to that other class of articles which deal with literature, history, and philosophy,

or, as Professor Baynes has phrased it, with "Man in his individual powers, complex relationships, associated activities, and collective progress." This circumstance is, in one respect at least, fortunate, for it is the less popular departments of scientific knowledge, which have been gained from the cloudland of idle curiosity by the application of those potent instruments of modern research, Philological and Historical Criticism, that require the assistance of a new edition of the *Encyclopaedia Britannica* to obtain for them adequate recognition, and to assign them their due place by the side of the physical sciences. Now it was exactly in these subjects that the old Encyclopaedias showed themselves, according to modern ideas, to be most defective. In natural science they were undoubtedly on a level with the best knowledge of their time, and in their technical and literary articles there still seems but little to complain of; whereas the notices they gave of persons and things connected with ancient history are scarcely above the level of Lempriere, and the field which has now been mapped out and surveyed by comparative philology they occupied either with baseless conjectures or old wives' tales. It is therefore pleasing to observe that, on the whole, this opportunity for improvement has not been neglected. As two signal examples of the degree of change that was required, reference may be made to the articles headed "Alphabet" and "Alexander VI." in the edition of 1842, as compared with those in the present volume. Thirty years ago Mr. Thomas Jefferson Hogg thought it appropriate to the dignity of an Encyclopaedia to ridicule with learned ignorance and laboured Scotch wit the theory which at that time had been sufficiently demonstrated, that the source of the alphabet was to be looked for in Egyptian hieroglyphics, and to throw doubts upon the debt which in this respect Greece owed to Phoenicia; but Mr. John Peile, who has now undertaken this subject, shows how completely his mind is open to the results of the latest research by his acceptance of the discovery which finds the origin of the cuneiform character in the non-Semitic predecessors of the Assyrians. Similarly in 1842, it was held sufficient to dismiss Pope Alexander VI. with the following brief paragraph:—

"Had four bastards when he was cardinal, for one of whom he had so great an affection that he stuck at nothing in order to raise him: designing to poison some cardinals, he was poisoned himself (see Borgia)."

On looking out the reference to Borgia, we find merely some vapid speculation on the motives which could have induced Providence to permit to exist such monsters as Caesar and his father. The present edition contains an article nearly seven columns long, by Mr. Richard Garnett, who treats his subject under the light which German historians have lately thrown upon it, and at least shows that it is not unworthy of so lengthy a treatment. Though, however, there is under these subjects much to praise, there is also a good deal that must not be passed over without censure; for there are a considerable number of minor articles on subjects connected with ancient

history which display a very slipshod method of treatment. In this instance, as in almost all the others where serious fault may be found with the value of this publication, the explanation is at once to be found in the circumstance that unworthy articles have been too readily transferred from old editions, and in the almost pardonable belief that if only the longer dissertations can be kept up to the high-water mark of progressive science, the shorter notices may be left to shift for themselves. It is only in this way that we can explain, but not excuse, the old-fashioned blunders which disfigure, among others, the articles headed "Aborigines," and "Ahenobarbus;" where we read, under the former,

"that the Latin nation was formed by the union of an Oscan and a Pelasgian tribe, as is proved by the circumstance that the structure of their language discloses numerous words closely connected with the Greek, and also numerous words that are of an entirely different origin."

And under the latter, that

"the name was derived from the red beard and hair by which many of the Gens Domitia were distinguished."

It is to this same cause of insufficient editorial supervision that we may most probably attribute the disproportionate space which is appropriated to some of the headings. The Acropolis, for example, concerning the topography of which modern investigation has been particularly active, takes up no more than fourteen lines, and the Alhambra three columns; Dean Alford has more than four columns of graceful eulogy signed by Charles Kingsley, while Dean Aldrich is disposed of in less than one; the life and character of the great Akbar, and the philosophic position of Albertus Magnus do not occupy much more than half a page each; whereas to Addison, whose fame is independent of any Encyclopaedia praise, nearly nine pages are devoted.

It is, however, an invidious task to pick holes in a work which in its general execution fully satisfies the expectation with which its appearance has been awaited, and therefore we would rather turn to those articles which entirely reach the highest standard of performance which any critic could frame, and upon which will depend its permanent value for instruction and reference. Among these longer articles more particular reference may be made to those which deal with geography. Colonel Yule writing on "Achin" and "Afghanistan," Mr. A. Keith Johnston on "Africa," and Mr. David Kay on "Algeria," and Mr. Ball on the "Alps," have each treated their subjects in that exhaustive and honest manner which might have been anticipated from their reputation, and at the same time have not disdained to express their accurate knowledge in a style that attracts and convinces the class of ordinary readers, for whose benefit, it must never be forgotten, Encyclopaedias are really published. The article on "America" which is unsigned, is spoilt by gossipy narrative and unsound speculation; for both which reasons we were not surprised to find that it is substantially reprinted from the edition of 1842. The articles on "Adulteration," by Mr. H. Letheby, and on "Aero-

nautics," by Mr. J. Glaisher, are also all that could be wished. Upon those on theological subjects, which we have carefully compared with the corresponding ones in *Smith's Dictionary of the Bible*, it is not easy to give a concise judgment. They are contributed by students who have manifestly taken great pains to acquaint themselves with the most advanced German criticism, and who are not afraid of its results. Dr. Donaldson's article on the "Acts of the Apostles," seems to us to express with much impartiality the many conflicting opinions which have been held touching the authenticity and character of that book, and to indicate his own conclusions with much discretion; but Dr. Davidson, who writes concerning "Adam," has not escaped unscathed out of the furnace of German and Dutch criticism, for it can only be from thence that he has drawn that infelicity of language and thought which repeatedly induces him to style Adam and Eve "the two protoplasts," and to remark of the Fall that it was at once one of the most fortunate facts in man's history, and also one of the saddest. In this same connexion, attention may be called to a series of articles which are signed "A. B. G.," upon Puritan and Presbyterian Divines, which are so original in their information and in their appreciativeness as to form quite a novel feature in this work. There is also an entirely new article by Professor Nicoll on "American Literature," which within the limits of some sixteen pages not only summarises the leading characteristics of all those American writers who are at all known on this side of the Atlantic, but also introduces us by name and with a convenient epithet to further crowds of American literary men; and this with a dazzling brilliancy of illustration and a wealth of epigram which, we should imagine, must now for the first time figure in the solemn quarto pages of an encyclopaedia. Another new article which ought not to be passed over in silence is that on "Alchemy," by M. Jules Andrieu, who writes on a captivating but obscure subject with the enthusiasm of a genuine student. The reader will pardon a little exuberance of language, and an inordinate use of antithetical tropes, in consideration of the decisive manner in which the writer vindicates for his half-forgotten heroes a high position in the historical evolution of scientific thought. The longest article in this volume is that on "Agriculture," and though its author no doubt expounds with suitable illustrations the principles and practice of high farming and its scientific methods as carried out in the best districts of Great Britain, yet it cannot be said that in other respects he has put before himself the comprehensive ideal to which an Encyclopaedia article on such a subject should conform. His historical sketch is miserably inadequate, except in so far as he quotes from the early English writers, and these quotations are borrowed from earlier editions of this publication; he hardly refers at all to the practices of other nations, and is totally silent upon that important branch of his subject which has lately been invested with a peculiar interest, viz. the mode of tenure

and cultivation which is summed up in the phrase "village agricultural community." The article on "Acclimatisation" by Mr. A. R. Wallace is also disappointing, though for different reasons. It seems to us to be characterised by a certain looseness of thought, and an unintelligent application of the theory of natural selection, which produce upon the mind of the ordinary reader a general indistinct impression, and leave him to reflect that much yet remains to be done to bring this attractive subject within the range of scientific method. On philosophical subjects the articles are uniformly good. That on "Aesthetics" by Mr. J. Sully gives an admirable historical disquisition on the subject, which perhaps is the only fashion in which he could have treated it; but the high character of what he has done suggests a regret that he has not ventured to found upon the learning he has gathered an original dissertation of his own. Professor Croom Robertson has contributed a number of minor articles, and whether in his biographical portrait of "Abelard," or in his explanation of the philosophical use of the word "Analysis," he is always full in his knowledge, clear in his own thoughts, and popular in his style. In natural science proper, the chief articles in this volume are four in number—two by Professor Huxley on "Actinozoa" and "Amphibia," one by Mr. D. Thomson on "Acoustics," and the concluding article on "Anatomy" by Mr. W. Turner.

We have thus briefly run through the leading contents of this volume, and if it may be thought that we have been too uniformly adverse and hypercritical in our short comments, it should also be recollected that the mere quotation of some of the names of the contributors which we have mentioned is in itself a higher guarantee of excellence than the fulsome commendations of any critic, and that it is this very high standard attained by the majority of the articles which shows out by contrast the slightest unevenness of work. The faults of the volume are almost solely those which it has inherited from its predecessors, its merits are all those of its present editor and contributors. We could have wished indeed that Professor Baynes had been energetic enough to take one important step, of which the advantage is repeatedly suggested on any chance opening of this book, and had boldly reverted one degree nearer to the type of the great *Encyclopédie*, by eliminating from these pages the mention of all those unimportant men, places, and things—e.g., "Achan," "Ai," and "Almoner"—which cannot be so treated as to deserve any place whatever in the sphere of universal knowledge, and may safely be relegated to the care of special dictionaries. It was one of the great merits of the French Encyclopaedists that they transformed Chambers's dictionary of useful information into an Encyclopaedia which attempted to rearrange human knowledge, as an organic whole, from the point of view of its comparative value and scientific worth. The earlier editions of the *Britannica* adhered to the same principle, and now that countless minor works, and notably the *English Cyclopaedia*, have satisfied amply the wants of the merely curious, it would have been worth

some trouble to purge this edition of a quantity of superfluous matter which can never be required by those who will consult this book for its primary purposes. This, however, is a fault rather of excess than defect, which does not substantially affect the pre-eminent merits of this publication; and, in conclusion, it remains to express our deliberate opinion that if the following twenty volumes maintain, or even approximate to, the excellence of this first instalment, the reading public of the Anglo-Saxon race will have deep cause for gratitude to the publishers for having undertaken what must be nothing less than a gigantic speculation, to the editor for years of imperfectly recognised toil, and to the various contributors who worthily occupy the places of those who formerly made the reputation of this Encyclopaedia. JAS. S. COTTON.

Lives of the Queens of England of the House of Hanover. By Dr. Doran. Fourth Edition. In Two Volumes. (London: R. Bentley & Son, 1875.)

WE are not surprised that these handsome volumes should have attained to the distinction of a fourth edition. Biography can be dealt with after various fashions. There is the severe style, which loves to clothe its central figure with abstruse reflections, manufactured erudition, and a rhetoric too considerate of that dignity which is said to be due to History. There is the style of the essayist, which discards the ordinary narrative of mere facts for a pure criticism on the work achieved—by which the individual is lost in his labours. There is the dramatic style, which seeks by startling contrasts to bring out in bold relief only the striking incidents of the memoir, to the exclusion of the tamer and more homely events—where the light over dazzles us for want of shading. There is the Carlylese style, where the living man with all his faults and virtues is portrayed by, and not at the expense of, his work, and where every petty detail preserved by biography inculcates a moral lesson. There is the religious style, the sentimental style, and the egotistic style, where the writer treats more of himself than of his subject. Lastly, there is the light, chatty style, where anecdote and gossip reign supreme, and dry facts never intrude. And it is to this last class that the work now before us belongs.

Dr Doran is essentially the chronicler for the earlier stages of the Georgian era. He writes in an easy jaunty fashion, at times verging on flippancy, is never dull, and contents himself with selecting only the lighter and more amusing episodes in the biography of his heroines. He delights in recording the gossip of the back stairs, naughty flirtations and domestic wrangles. His pages are full of those scenes that Lord Hervey loves to describe—jealousies, petty quarrels and discussions, small talk, and incidents that bring out the weaknesses of women and the vices of men. His information, though not pretending to much originality in the way of research, is yet well put together and told attractively. That he has not laboured in vain is evident by the success his work has obtained. Nor is this success to be wondered at. A book which is easy to

follow, which never needs skipping, and which deals largely in anecdote and scandal, while possessing claims to be considered as History, is always sure of readers.

Dr. Doran's volumes consist of biographies of Sophia Dorothea of Zell, the wife of George I.; of Caroline Wilhelmina Dorothea, wife of George II.; of Charlotte Sophia, wife of George III.; of Caroline of Brunswick, wife of George IV.; and of Adelaide of Saxe Meiningen, the wife of William IV.

The story of the unfortunate consort of the coarse, sensual, first George is well known. Every schoolboy, to use the favourite expression of a late historian, is acquainted with the circumstances of her birth, her ill-fated marriage with Prince George, the intrigues of the odious Madame von Platen, her intimacy with the fascinating Königsmark, and her wretched imprisonment in the Castle of Ahlden. As with Mary Queen of Scots so with Sophia Dorothea, the chief question that her biographer has to answer is, was she guilty? We know that she admired Königsmark, that he was her early companion, and that she always entertained very friendly feelings towards the handsome colonel of the Guards. But was the intimacy criminal? Dr. Doran, with as much gallantry as success, proves the charge to be utterly unfounded. Of late years a voluminous correspondence, purporting to be letters between Sophia and the Count, has been discovered in Sweden, and if it is genuine the question of the unhappy woman's innocence is at an end. These letters consist of mutual assurances of love and everlasting fidelity, of plans for privately meeting, and of complaints at separation. In them Sophia speaks in the most fervid manner of her *ardeur*, reproaches her lover for his coldness, and declares herself ready to sacrifice her reputation for him, and to accompany him to the remotest corner of the world. The famous "casket letters" could not be more damning. But Dr. Doran alleges various reasons for regarding this correspondence as a gross forgery. In the first place, Sophia Dorothea, it must be remembered, never had the guilt implied laid to her charge. At the trial the name of Königsmark was never once mentioned. Glad as both Prince George and his mistress Von Platen would have been to prove her *liaison* with the Count, they felt they had not a shred of evidence to go upon. Spies were set about her, strict search was made amongst her papers, but all the wiles of espionage failed to bring to the light the requisite proofs. The charge of adultery having fallen through, whatever suspicion might insinuate and scandal allege, Sophia was punished by her consort solely on the grounds of disobedience and desertion. Where were these letters at that time? By whom were they concealed? How did they find their way into Sweden? It is said they were captured at great peril, costing the life of a brother and the freedom of a king's mother. Yet no one ever heard of the robbery, or the means by which it was effected. Again; we know how closely the Princess and the Count were watched in order that a case might be made out against them. Is it therefore conceivable that they should have written to

each other in a strain fatal to life and honour if discovered, should have sent their letters in the ordinary way through the post, and when received should have continued to preserve them? "If two persons," writes Dr. Doran, "knowing they were watched and their letters detained, could write such fiercely ardent assurances of mutual love, express such utter contempt for the consequences of discovery, and explain to one another how they were tricked and betrayed, they must have been hopelessly insane." The thought that human nature can sink itself so low as to forge letters with the idea of slaying reputations by the forgery, is one of the most repulsive that can be entertained. And yet it has been done. Numerous were the letters forged in France to destroy the reputation of Sir Isaac Newton. Letters of Shelley to his wife containing vile aspersions against his father have been forged. Letters of Byron have been forged. As a mere matter of business, the manufacture of forged letters, at critical moments when the demand is likely to be eager, is always active. "Till something more," says our author,

"is known of the history of the alleged correspondence between Sophia Dorothea and Königsmark—of which correspondence nothing was known to the world till more than a century after her death—let us put against it her own assertions of her innocence. It is only a woman's word; but it was asserted on solemn occasions, and it may surely be accepted against the letters which were not put forth till long after she too was dead and defenceless, who when living was not charged with the guilt which this mysterious correspondence would cast heavily upon her."

In his life of Sophia Dorothea Dr. Doran shows his literary ability, and the method in which history should be treated, to the best advantage; but it is in his accounts of Caroline of Anspach and of Caroline of Brunswick that we come across the racy *raconteur*, the man who dearly loves to impart the last scandal, the last bit of gossip, the wrangles in high life, the talk of the clubs and coffee houses, and the domestic feuds of the Court. By the light of his pages, as with the chatty letters of Horace Walpole, we are led to form an excellent idea of the manners and customs of our ancestors, of their mode of life, their tastes, sports, and dissipations, and the standard as to faith and morals that they affected. Delving in the rich mines of Walpole and Hervey, Dr. Doran reproduces a good picture of the past. The clever, hard, faithful Caroline, the consort of George II., stands out in bold relief against the background of chat and scandal that the author environs her with. We see her deep devotion to her coarse, brutal little husband, whose one only good point appears to have been his courage. We read how her royal consort quarrelled with her, swore how deeply he was attached to her, neglected her, and made her receive his mistresses. We hear of the wrangles that ensued between the Court and Leicester Fields, where the Prince of Wales—hated, we know not why, by his parents—and "cette diablesse Madame la Princesse," his wife, kept their royal state, and gave back with interest the love that was meted out to them by the monarch and his consort. We see the King offering his addresses to the beautiful Mary

Bellenden and being most saucily snubbed. We hear much of one Mdme. Walmoden, and of others who were enrolled among the list of favourites. We are introduced to the men of the day, see them, and listen to their doings. There passes before our eyes the cynical, unbelieving Walpole, who averred that every man had his price, and showed by his doings that he was not mistaken. We listen to Hervey's sneers as he amuses his Queen by his pitiless gossip and fiendish innuendoes. We see the courteous Chesterfield, a smile on his face and treachery in his heart; the half-mad Dean of St. Patrick's, savage with mankind for his non-promotion to a bishopric; the author of the *Dunciad*, smiling, spiteful, and with a wit that loves invective; the servile Hoadley, serving God and Mammon with wonderful success; the charming Lady Suffolk, the beautiful Mrs. Howard, and all the Graces of the Court. We read of the customs of the time—how men and women intrigued, how appointments were bought and sold, the thousands that changed hands at cards and whist, the races that were run, the bottles that were drunk, the outings at Bath and Tunbridge, Harrogate and Scarborough, the quaint old tunes that were played, the stiff formal dances that were severely stepped, the game of tennis, and the like. Last scene of all, we see the Queen on her deathbed, the King by her side sobbing, and the courtiers gravely expecting the worst. "You will marry again," says Caroline to her husband, "I beseech of you to marry again." "Non, non," replies the King, his voice choking with emotion; "j'aurai des maitresses." Before such a scene satire and irony stand dumbfounded; still, the answer not inaptly shows us how society lived, and what it thought, in the days of the hero of Dettingen. And if the reader wishes to see how hollow it was, how pernicious its tone, how coarse its fine men and great ladies were, how despicable, artificial, and unwholesome was the atmosphere all around, let him read and study for himself the pages of our author.

Of the sad story of the life of Caroline of Brunswick, even Dr. Doran cannot give us much that is new, but he puts his facts and statements before us in so pleasant and agreeable a manner that they may strike many as new. Dr. Doran has the happy faculty of sketching character in a few light touches, and of illustrating events by an anecdote, which make his chapters always readable, and even when instructive prevent him from being dry. To the lover of gossip the life of Queen Caroline is a rich mine. Who is there that does not know her sad history? Brought up in a vicious Court, educated by her weak, coarse-minded mother, married to a heartless worldling, separated, shunned, seeking the society of her inferiors since she was denied that of her equals, her biography is but the story of passion uncontrolled, flippancy, indiscretion, exclusion, and a bitter mortification that finds its only solace when life is ended.

"Nevertheless, for this poor woman," writes Dr. Doran, both wisely and mercifully, "there is something to be said. She was ill-educated, religiously educated not at all, and never had religious principles as expounded by any particular

church. Her mother was a foolish, frivolous woman, and her father whom she ardently loved, a brave, handsome, vicious man, who made his wife and daughter sit down in company with his mistresses. With such an example before her, what could be expected from an ardent, spirited, idle, and careless girl? Much—if she had been blessed with a husband of principle, a man who would have tempered the ardour to useful ends, guided the spirit to profitable purpose, and taught the careless girl to learn and love the cares, or duties rather, which belonged to her position. But by whom and what was that Princess encountered in England, whither she had come to marry a Prince who had condescended to have her inflicted on him, and bringing with her the memories of pleasant communings with more courteous wooers in Brunswick? She met a husband who consigned her to companionship with women more infamous than even she herself became, and whose interest and business it was to render the wife disgusting to the husband. They speedily accomplished the end they had in view, and when they had driven the wife from the palace, they endeavoured to prove her to be guilty of vices which she had not then in common with themselves and her husband. If he ever justly complained of wrong, he at least took infinite pains to merit all that was inflicted on him. He outraged every sense of justice: when steeped to the very lips in uncleanness, he demanded that his consort should be rendered for ever infamous for the alleged commission of acts for which he claimed impunity on his own account."

The biographies of the consorts of George III. and of William IV. are interesting, but their chief value lies not so much in the account of the individuals themselves, as of the history of the period in which they lived and of the mention of their contemporaries. We can only direct the attention of the reader to their pages: they will repay perusal.

Dr. Doran's volumes supply a gap in our historical literature that has too long been left a blank. Of the period embraced by his work we have ample material—biographies, diaries, journals, *mémoires pour servir*, and the like—for the compilation of a worthy and interesting history of the Queens of the House of Hanover. It has been for Dr. Doran to collect this information, to winnow its chaff from the grain, and to present it to the public in a most lively and readable shape. He has shown that biography can be accurate without being dull, and full of gossip without erring against good taste. He has commanded success, and he has deserved it.

ALEX. CHARLES EWALD.

Statement exhibiting the Moral and Material Progress and Condition of India during the Years 1872-73. By Clements R. Markham. Ordered by the House of Commons to be printed June 2, 1874.

(Second Notice.)

THERE is no function of government which in India more affects the welfare of the masses than the administration of the Land Revenue. Indian writers, in discussing the subject, frighten away English readers by a needless use of technical terms; but the principle of all the systems is simple, and should interest every one acquainted with the great branch of political economy, the Theory of Rent.

From time immemorial the ownership of

the land in India was vested in the ruling power, and the resources of the Government have been therefore supplemented by a right to what in the nature of things must ever increase in value, the rent of the land. In a great part of the country the English Government have preserved this right intact, and receive the rent directly from the cultivator. This is the Ryotwar system in force in most parts of the Madras and Bombay presidencies. In the North West Provinces the Government receive the rent from the village communities as separate entities. This constitutes the village system. In Bengal and parts of Madras the Government divided the land into estates, which they made over to the persons who had previously collected the rent, and fixing this in perpetuity at the existing money rate, in fact alienated all future increment of the rent for the benefit of the collectors, called Zemindars, and this constitutes the Perpetual Settlement system of Lord Cornwallis.

Each system has its own advantages and defects, and it is natural for Englishmen, accustomed to the existence from time immemorial of a landed aristocracy, to grasp at once at the advantages of the Perpetual Settlement which created such a class in India, and to ignore the benefits of systems which do not admit the existence of such a class. Yet the Ryotwar system as now carried out in most of the districts of the Madras presidency, would appear, if fairly examined, to be one of the not least successful efforts of our philanthropic rule.

Mr. Markham's statement gives ample details of the pains that have been taken in Madras to survey scientifically all the cultivable land, to make maps of every existing field, recording every existing right, and to fix on each field a money demand, calculated on the grain value of its produce, ample care being taken that this should not exceed one half of its net produce, *i.e.*, one half of the real rent according to the Ricardo theory. It has been objected to the Madras system that it entails a yearly settlement with the cultivators, but objectors are hardly aware that this is absolutely necessary in their interest. The Madras peasant proprietor holds his land on a perpetual tenure, subject to the regular payment of the demand, and in the case of dry cultivation he is responsible for that payment whether he cultivate the land or not, unless he formally notifies in writing by a certain date in the year that he has abandoned any field entered in his name on the village register.

In the case of irrigated land, however, there is a contract on the part of the Government to supply water sufficient to bring the crop to maturity, and if the crop fails from want of water, no payment is required. Irrigation, when sufficient, gives a large profit to the cultivator, who then pays a proportionally large assessment; if the supply of water fail at a critical period, the whole crop is lost, and justice requires that a remission of the rent, which in this case is partly a water charge, should be granted. Irrigation works, therefore, necessitate a yearly settlement with the cultivators, who share with the Government the risk of total loss in case of failure of the water supply,

and the large profits of success. In Madras any landed proprietor may construct an irrigation work at his own risk and outlay, in which case he is responsible for the rent of the land only, and the Government shares neither in the risk nor profit of the venture. It would be difficult then to improve the position of the peasant proprietors of the Madras presidency. They have absolute fixity of tenure, subject to the payment of a moderate ground rent; they can obtain a map of their holdings, as scientifically accurate as that of any property in England; they can reduce their holdings at will, and introduce any permanent improvement without addition to their rent; and that this is in fact most moderate is proved by the regularity with which it is paid by the whole body, the majority of whom do not pay more than one pound a year in rent, and pay it on the day.

It would be a mistake to consider the smallness of the general mass of holdings as a sign of the wretched poverty of the agricultural class. There are large peasant proprietors, but the system in force allows every day labourer to possess his own plot of ground, and to be as independent in that possession as his wealthiest neighbour. It is a singular fact that the late Mr. J. S. Mill suggested the application of the Ryotwar system as the remedy for the agricultural difficulties in Ireland. It would possibly be a complete remedy, but unfortunately requires as a preliminary the impossible cost of purchasing out all existing rights of the present proprietary.

The village system of the North-West Provinces is probably in effect not very different from the Madras Ryotwar, though less care is taken of individual rights; and it would seem to encourage a species of communism rather than personal proprietorship; but of this system I have no personal experience.

The blot on the zemindarry system of Bengal is that, in effect, the rights of the cultivators were absolutely ignored. Such was not the original design, which—while it created a body of large proprietors, who were alone to be responsible to Government for the permanent demand on the estates—intended to preserve at the same time the existing rights of the cultivators. In early times of depression, however, the zemindars failed to pay their rents; the estates were sold in default; and, as shown by Mr. Markham, within ten years there was a complete revolution in their ownership. Increased powers over their ryots were granted to the zemindars to enable them to meet the Government demand; the rights of the actual cultivators were soon ignored; and they shortly became mere serfs on the property, subject to every exaction and wrong. There were no surveys, no registries of the land; the zemindars leased out their lands at will, and grew wealthy simply by the fact that the Permanent Settlement had fixed the Government demand on them for ever, while there was no legal limit to their own exactions. To the honour of Sir George Campbell, the last Lieutenant-Governor of Bengal, he was the first to attempt to remedy these crying evils. By means of a registry requisite to levy the road-cess, he made a

first attempt to record the rights of the cultivators; and, instead of selling estates in default of payment by the zemindar, the practice has been introduced of taking them under direct Government management. In effect, the Ryotwar system is being carried out where it is possible without breach of faith. Such examples must prove most beneficial: the worst class of zemindars will be constrained, the better class be led, to respect their tenants' rights; while a growing spirit of independence in the ryots themselves, proofs of which are shown in Mr. Markham's report, gives ground of confidence that, as a class, they are learning to protect themselves.

Mr. Markham's section on the Land Revenue is admirably clear and complete. I have endeavoured to represent, free from all technicalities, the existing state of things under the more important systems; and having had charge of districts in the Madras presidency, both under Ryotwar and Permanent Settlement, I have written with personal knowledge of both, and, I believe, without foregone prejudice in favour of either. I think that the peasant proprietors of Madras are as happily situated as any class of cultivators in the world: they are not rich or educated, but they enjoy a rude plenty, and have few wants; they have nothing to fear but the natural vicissitudes of the seasons, and to them at least the English Government has given that priceless boon, personal independence, and the means of obtaining moderate material prosperity.

It would be impossible to go through a tithe of the subjects regarding which Mr. Markham's Statement gives details. Among the luxuries of civilisation our rule has bestowed on India a paper currency, which, for some years a mere convenience to the English in the Presidency towns, and used only as a means of remittance by native traders, is beginning to gain the confidence of the most suspicious race in the world, and since the introduction of ten-shilling notes to be even used in the ordinary transactions of petty trade. Such a medium of circulation, introduced in the year 1861, must prove of the greatest convenience to the trade of a country in which a cumbersome silver currency was alone previously in force, and guarded as it is by the most careful regulations, can run no risk of depreciation. The Post-office performs its functions at an even cheaper rate than in England, and a letter is carried for three-farthings from Peshawar to Cape Comorin. All the important towns throughout the Empire are connected by the electric telegraph, which wealthy natives sometimes employ as an ordinary means of correspondence. The Indian system is connected with England by three different lines, and the news of every important event in Europe—the fall of a dynasty, the defeat of a ministry, the winner of the Derby, are flashed within a few hours to the remotest stations of our great dependency.

It is not to be supposed that a Government which makes somewhat a parade of its philanthropy should omit the subject of education from its programme, and there are in fact few that have obtained more attention, though unfortunately with less satisfactory results. The real difficulty is, of

course, one of finance. It is impossible alike to educate or to feed a whole people out of the ordinary revenues, and it is at least matter for doubt whether it is worth while to provoke general discontent by imposing special taxes for the purpose. There is, however, in India a self-created additional difficulty in the educational system adopted, which requires that knowledge should be imparted through the medium of the vernacular languages. What the youths of India want to learn is the English language, and for this they will even pay. They only submit to the vernacular instruction forced upon them, in order to learn English. And this universal desire, so useful to the interests of our rule, we set aside in obedience to an educational hobby. A poor man will pinch himself sorely to afford an English education to his son, with the laudable hope of advancing him in life. He grudges the smallest cess collected from him for the introduction of a school to impart to the younger generation European knowledge through the medium of the vernacular.

The statistics on education given in Mr. Markham's Statement are so imperfect, that no trustworthy information can be obtained from them. In truth the work effected on the body of the people is nothing, while there are tangible results in the higher education of the few. The graduates of the Indian universities, and their predecessors educated in the old high schools, have proved themselves in the public service not unworthy of the teaching they received. They have entered into that service with an honourable determination not to disgrace their class; they have leavened the official world, and raised the tone of native official morality; with few exceptions they have proved that natives influenced by a European education are actuated by European notions of honour, and can be trusted like Englishmen in positions that require integrity. The Educational Department may be more proud of such a result, and may claim to have benefited India more, than if they had succeeded in planting an elementary school in every village in the country.

The great difficulty in India is to make the demands of a highly civilised government correspond with the financial necessities of a poor country—to indulge in the luxuries of education, sanitation, and other expensive ideas of modern improvement with foreign subjects who care little or nothing for such things, and bitterly grudge their cost. It is in the attempt to solve this problem that the experiment of introducing municipal institutions has been lately tried. The endeavour to revive the principle of self-government, inherent in the Indian village communities, is in itself excellent, but the experiment of raising local cesses for sanitary and other improvements requires close watching, as there is nothing that creates more general discontent amongst a people that do not value these things. Municipal taxation is generally levied in direct cesses, which are as unpopular as the income tax, and fall even on the poorest classes, and it will be wise to curb official zeal in such matters, and not to force expensive improvements upon an unwilling people.

Reviewing the whole results of our Indian

administration, it is a subject for just pride to feel that it has ever been actuated by high aims, and an unselfish desire to advance the prosperity of the people. Many mistakes have, of course, been committed, and much that we desire to effect remains to do. But, better than many of the luxuries of modern civilisation—telegraphs, railways, &c.—our rule has bestowed on the millions of our Indian subjects the priceless blessing of universal peace, and general personal security before unknown. We may fairly say of the English Government of India:—

"Tu spem reducis mentibus anxiis
Viresque: et addis cornua pauperi,
Post te neque iratos trementi
Regum apices, neque militum arma."
JAMES INNES MINCHIN.

Scoti-Monasticon. The Ancient Church of Scotland. A History of the Cathedrals, Conventual Foundations, etc. By Mackenzie E. C. Walcott, B.D., Præcentor of Chichester. (London: Virtue & Co., 1874.)

It is so rarely in these degenerate days that we take up an antiquarian quarto, that the very sight of so goodly a tome in all the cunning garniture of gilding and leather has a tendency, at least in our mind, to disarm criticism and censure to no inconsiderable degree. We feel this especially in the case of the new volume which has just issued from Mr. Mackenzie Walcott's prolific laboratory. The size of this book, its outward appearance, nay, the paper and the presswork, merit our warm commendation. The copperplates we have seen before, still they suit their present domicile tolerably well. We are sorry to say that we cannot go much farther than this in Mr. Walcott's praise. Like Mr. J. H. Blunt, and Dr. Hook in old times, Mr. Walcott is a great person for manuals. It is not every one who can compile a manual successfully. We call to mind a letter of thanks in which Mr. Surtees, the historian, expressed his gratitude to a brother antiquary who had sent him a copy of a capital little guide to the cathedral of Durham, which is still a pattern of brevity and learning:—

"Why here's an abbey in octavo shut,
Just like great Homer's Iliad in a nut!"

But Mr. Walcott does more than this. All the early religious system of Scotland, all the monastic and cathedral churches and churchmen, are brought within the compass of 428 quarto pages, index included. To produce this, half of the publications of the Bannatyne, the Maitland and the Abbotsford Clubs, with numerous other works of renown, have been thrown into Mr. Walcott's crucible, together with shreds of fiction and poetry, and the lucubrations of other writers who sit so far below the salt, that it is savourless when it comes to them. Out of this medley some alchemists, perhaps, might have extracted Corinthian brass. We think, however, that Mr. Walcott has tried to put more in than his pot would hold, and that in endeavouring to squeeze everything into it he has maltreated his materials and burned his fingers. We are certainly dissatisfied with the result. As Mr. Walcott observes, "his object was to produce a compact book, suitable to the

wants of the general reader, and yet not unworthy of the attention of the learned, for whose use I have appended a copious list of authorities and references both manuscript and in print." Now this volume certainly is compact, and is drawn up in a systematic manner. Whether it is suitable or not to the general reader, is a matter of doubt, but general readers are never too exacting. As to the learned, we scarcely think that they will be satisfied with Mr. Walcott's list of authorities and references, and with the use he has made of them. These lists appear in the front of the volume as a sort of standard of orthodoxy. And they are placed on a smaller scale, at the head of each chapter and subject. Once for all, let us tell Mr. Walcott that we do not like to have references huddled together at the head of a chapter, according to what seems to be the Chichester use, and after the fashion of chickens in a hen-coop. References ought always to be appended to the special fact of which they are the guarantee. It is, of course, more difficult to do this when the work in which they appear is a conglomeration of minutiae. We have no idea whatever of objecting to such conglomerations. But when authors, or editors, think fit to summarise in this way, accuracy and precision are indispensable. What can be the use of giving names and dates and small details in profusion, unless they are exact and authentic? We do not wish to be too hard upon Mr. Walcott. He has undertaken a difficult task; in some respects he has handled it with becoming dignity; and he writes also in a tone and spirit which many might copy with advantage. It is with no little regret, therefore, that we feel obliged to point out some blemishes in his work which seem to us to be of a very serious description.

At the end of his preface Mr. Walcott gives an imposing list of the authorities which he professes to have used. There were many others within his reach which are most unaccountably left out. When we mention among these the invaluable works of Dr. Reeves, the prefaces of Dr. Stuart to his grand work on the *Sculptured Stones of Scotland*, the *Book of Deer*, and other works of minor interest indeed, although still important, it is plain that there is something defective in Mr. Walcott's book. Of Mr. Skene's invaluable edition of Fordun Mr. Walcott makes a very insufficient use. In giving the list of the Bishops of Man and the Isles, Mr. Walcott does not seem to be aware that there is in existence such a book as the *Chronicle of Man*, and he is entirely ignorant of the list of the prelates which was drawn up by Professor Stubbs and printed by him in the *Gentleman's Magazine* for 1862. Compare this list with that given by Mr. Walcott, and what a difference! But those who wish to discriminate between careful and careless history must test Mr. Walcott's work with the notices of the Scottish sees and their officers in that tomelet of the new edition of Wilkins' *Concilia*, a posthumous memorial alas! of the skill and learning of Mr. Haddan, whose premature decease all scholars must continually deplore. Put, for instance, Mr. Haddan's account of the Bishops of Whitborne alongside of that given by Mr. Walcott—or take any other see you like. Mr.

Walcott, we observe, inserts this new edition of Wilkins in his list of commendable authorities. If he had used this particular volume, we should have had less to say about his shortcomings. And he might have used it, or at all events corrected his mistakes by it, inasmuch as Mr. Haddan's volume was issued at least a twelvemonth before the *Scoti-Monasticon* appeared. It is scarcely fair to treat the history of the great Scottish Church in so perfunctory a manner. We would rather have a few pages of the unpretending and trustworthy work of Mr. George Grub, than whole libraries of the manuals or reprints which Mr. Walcott or Dr. Gordon seem always ready to produce.

We wish that Mr. Walcott had taken the pains to spell correctly the names of places and persons. Errors of this kind, many of which might have been avoided by using some ordinary directory, occur *passim*. We also observe some peculiarities in the use of the diphthong. *Præbenda* occurs with and without it, but Mr. Walcott is always true to *Præcentor*. One would have thought that this had been regarded as an English word ere this; at all events, it is not Mr. Walcott's fault if it is not so. *Præbenda* is a Latin word; *Precentor* has become an English one. If it is still to be written with a diphthong, we must expect to see *præcede*, *præfer*, *præcinct*, *præsume*.

It sounds strange to hear in 1198-9 of "the hon^{ble} Roger, son of Robert Earl of Leicester" (p. 85). It is also strange to see it stated as a positive fact that Richard II. died and was buried at Stirling (369). In another place (300) Mr. Walcott makes him die there in 1326, many a long year before he was born. Blemishes like these might be multiplied to any extent. And here is a specimen of the mess in which Mr. Walcott's careless generalisations sometimes place him. He is speaking of the Friary at Dumfries, and the following is the conclusion of his account. "In 1357 James Lindsay actually poisoned his host Kirkpatrick, son of the Regent's murderer, at dead of night. John Duns, 'the subtle doctor, here took the habit of St. Francis' (the inverted comma is carried too far). In 1569 it was given to the magistrates" (p. 344). What was given? Mr. Walcott means the Friary; grammar "the habit of St. Francis." The Dumfries magistrates of that day would not have touched it with a pair of tongs!

We trust that Mr. Walcott, if his book goes to a second edition, will reconstruct and correct it. He loves his theme, and on that account we feel pained at being compelled to criticise it unfavourably. But Mr. Walcott seems to have other things in store for us. He hints, not obscurely, of the possibility of an Anglo-Monasticon proceeding from his laboratory. Does he remember the fate of Icarus? Let us deprecate beforehand in the strongest manner any attempt to borrow the wings of our noble Dugdale. Mr. Walcott has made an experiment already, and it has not been a successful one. Before he attempts another, let him try to repair the injury that he has unwittingly done to the great mediæval Church of Scotland.

JAMES RAINE.

Sorrow and Song: Studies of Literary Struggle.
By Henry Curwen. In Two Volumes.
(London: H. S. King & Co., 1874.)

MR. CURWEN, if we do not misunderstand his exordium, has written these six "studies of literary struggle" to prove that Grub Street and its attendant misery are not things of the past. But of the half-dozen writers whose stories he adduces, not one, it should be pointed out, is an Englishman, or in other respects confirms the truth of his proposition. Henri Murger, who has the post of honour in this series, notwithstanding the lowliness of his origin, and the excesses of his youth, was only prevented by a premature death from reaping the rewards of past labour. We must most emphatically protest against "Novalis" (Von Hardenberg) being deemed, in any way, a representative of "literary struggle," as from birth to burial nothing but the loss of his first love ever impeded the even tenour of his way. Petöfi and Edgar Poe both died a quarter of a century ago, and in lands where literature was but newly born. Eighty years have passed by since young Chénier perished on the scaffold, and if Balzac did not grow wealthy and prosper, ere he died four and twenty years ago, neither public nor publishers were to blame. If the aim premised were really Mr. Curwen's, he certainly has not kept to it, and we are glad he has not.

The authors whose lives Mr. Curwen has selected to typify the suggestively alliterative compound of "sorrow and song" are men whose stories must be badly told indeed not to prove interesting, even though the teller have few or no new facts to tell. But Mr. Curwen is determined not to be placed in the same category as Canning's "Knife Grinder;" rather than have no story to tell, he will construct one out of his heroes' books. "I have endeavoured," he candidly confesses, "to read the lives of my authors more through the medium of their own works than from any recognised biographies of the men themselves." Had Mr. Curwen been writing critical essays on the mental labours of these six men, we should have acknowledged the necessity of this method; but, in the present circumstances, such a system seems radically wrong. And the unavoidable result is that, instead of producing a standard work of reference, Mr. Curwen has contented himself with writing two volumes of very fascinating reading. Doubtless the reward, if less lasting, comes quicker for such books than for biographies which are strictly *mémoires pour servir à l'histoire*.

And yet Mr. Curwen has only partially adhered to his plan: De Mirecourt, for instance, would appear to have served for the basis of his story of Henri Murger. And a very charming, although ultra-romantic narrative has he contrived to construct out of it by the aid of several of *les scènes* of their unfortunate author's own *Vie de Bohême*. That Murger was, to some extent, the hero of his own works, it would be idle to deny; but that one tithe of the paradoxical sayings and improbable, not to say impossible, miseries endured by his Bohemians are to be fathered upon their author, is ridiculous, all dispassionate people will allow. Even Mr. Curwen cannot expect his readers to

accept as anything but satire the passage he quotes from *La Vie* respecting one of the cliques, whose residence, during a severe winter, was in the "Avenue de St. Cloud, in the third tree to the left after leaving the Bois de Boulogne, and on the fifth branch." Beginning life at the very lowest rung of the social ladder, and getting only the barest rudiments of education, Murger had necessarily to fight his way upwards through more than ordinary difficulties, and, dying early, had had no time in which to realise the results that would otherwise have followed his labours. The verity of his miseries cannot be denied, but the fact that he had selected literature for a profession must not be held accountable for them all. His employment by Count Tolstoy was the most fortunate circumstance of his youth, not so much because it lifted him into a superior sphere of life as from its leaving him plenty of leisure for study. His chief occupation at the Russian's seems to have been to cut and peruse the pages of new papers and journals intended for transmission to the Czar. Some of these publications passed through the hands of eight readers before they reached their destination, and De Mircourt's remark that "when everyone else was served autocracy received them," is a fit satire on the way a despot is served. Mr. Curwen relates an anecdote of this period of Murger's career which, if true, illustrates the Frenchman's note:—

"At the time of the Revolution of February, Count Tolstoy was so overburdened with work that he requested his secretary to aid him in writing his despatches. . . . Murger finished the official letters, and then betook himself to the eighth chapter of *Orbassan*, for which the printers were waiting. This done, he directed his correspondence, and in error sent the secret despatch destined to the Czar to the editor of the *Corsaire*: 'Sire,—The Revolution is triumphant; Louis Philippe and his family have fled. MM. Lamartine, Ledru Rollin have—&c., &c.' If Niermaitre was astounded at this official intelligence, the Czar was not less perplexed at the news he had so anxiously expected taking the undecipherable form of an odd chapter of a sensational story, with the promise 'to be continued in the following number.'"

The grandson of Peter the Great, De Mircourt adds, had not the delicacy to return Murger's copy. In parting from Mr. Curwen's sketch of Murger, we note that his story of the "Bohemian's" last moments differs somewhat from other accounts. M. Pelloquet states that just before the poor fellow's death, a friend who had been to see him in the hospital withdrawing his hand said "Au revoir." "Non, adieu," responded Murger, and never spoke again. "He passed away," says the author of *Sorrow and Song*, "murmuring 'Pas de musique, pas de bruit, pas de Bohême.'"

Grimm's declaration that "Petöfi will rank among the very greatest poets of all times and tongues" will sound strange in the ears of most Englishmen, but to his myriad admirers in other European countries such praise will not appear exaggerated. The man whose poems translators have made almost as popular in German, Polish, French, Flemish, Danish and Italian, as in his native Hungarian, must necessarily be a poet of mark, although with the exception of the

short biographical sketch prefixed to a volume of translations from Petöfi by the late Sir John Bowring, and the usual scanty notices in the encyclopædias, what English publication refers to the great Magyar poet? And yet, despite its brevity, the life of Alexander Petöfi was replete with romantic and strange vicissitudes, and in including it in his series Mr. Curwen has done well. For our part we are inclined to believe that Petöfi will some day be universally placed in the very first rank of lyrical poets. In short, we know of no recent memoir which has had a better *raison d'être*, and only regret that Mr. Curwen had not greater space at his disposal for a more extended sketch. The few translations which he gives of Petöfi's poems are less literal, but more fluent than those by Bowring, and seem to be a pretty close rendering of Chassin's, as his sketch, indeed, is apparently based upon the same authority's, but it is utterly impossible to transfer into the French the passionate language of Petöfi: there is something more akin to the great Magyar's "ever-questioning philosophy" in the English or the German, and Kertbeny's translations from Petöfi into the latter tongue are probably as close as poetical restriction will admit of. *En passant*, we would point out that the song which Mr. Curwen gives a translation of under the title of "Forward!" is not the "Talpra Magyar" at all, but a much less spirited composition; he has probably been misled by his French, or rather Belgian, authority.

In his memoir of Edgar Poe Mr. Curwen seems to have been rather more desirous to "adorn a tale" than to give the somewhat commonplace story of the poet's life. In all fairness to Mr. Curwen, however, it must be acknowledged that the inaccuracies of this life are not so much due to him as to his American authorities. In reading Griswold's *Memoir of Poe*, he has, like all impartial persons, naturally been disgusted with the biographer's open display of hatred for the subject of his story, and, asserts Mr. Curwen, when resolved to write the poet's life, "I began with a thorough determination to vindicate Poe from the aspersions Dr. Griswold had so cruelly cast upon him." After this assertion it seems strange to find Mr. Curwen declaring that "after sifting every item of evidence I could lay hands on for Poe and against Poe, my present monograph has turned out very differently from what I had hoped," and that he should then, notwithstanding the fact that there is scarcely an accusation made against Poe by his biographer but has been frequently refuted in print, repeat, as matter of fact, almost the whole of Griswold's calumnies! Elsewhere we have shown, upon irrefutable testimony, the utter falsity of Griswold's pseudo-*Memoir of Poe*, and it is neither necessary nor possible to recapitulate here the facts of the poet's career. Besides the misstatements, however, which Mr. Curwen has been led to make through following Griswold and his alter ego in the *Southern Literary Messenger*—this latter, doubtless, from Baudelaire's quotations—we find a few others new to us. Poe was born in 1809, not 1811, and we much doubt whether Mr. Curwen can give any authority, other than Griswold's,

for saying that the author of "The Raven" ever gave any other date. Upon what basis Mr. Curwen has raised his romantic superstructure of Poe's passion for Virginia Clemm having originated in 1822 we know not; but this we can say, if it be true, it is the most wonderful circumstance of Poe's life, the precocious young lady then being in her second year! Poe was first married to Miss Clemm in 1834, but she continued to reside with her mother until 1835, when, being only fifteen, she was again married to Poe, some doubts having been expressed as to the legality of the former ceremony. Poe's expulsion from the University of Virginia the unimpeachable records of the faculty disprove; and the statement, transcending Griswold, "that there was not a vice in the whole catalogue of human sins" that this young Yankee Helioabalus "did not hasten to commit," is utterly disproved by facts. It is needless, however, to re-tread the weary maze of lies in which Griswold and others involved Poe's history, and which Mr. Curwen, through no fault of his own, has so innocently followed, quoting letters which we do not hesitate to call forgeries, and recounting disgraceful anecdotes which had no foundation in fact. How apt he has been to adopt the idea of Poe's badness is shown by his statement that the poet's first use of the *Broadway Journal* was "to attack his enemies at Boston"—an assertion which reference to the pages of that journal in the British Museum Reading Room would have disproved. That the "Helen" of the poem quoted at page 155, vol. ii., was "one of the wealthiest women" of New England will doubtless surprise the lady to whom Poe wrote the lines. She was not, is not, even rich. The poet's engagement with her was not secret, as stated by Mr. Curwen, nor was it broken off in the way he describes, as reference to the *New York Tribune* for June 7, 1852, will show. But enough has been said to prove that Mr. Curwen has been misled by his authorities with regard to Poe's character; he has dealt with him less leniently than either Hannay or Baudelaire did, and yet doubtless with quite as much desire for veracity as they had. Should *Sorrow and Song* reach a second edition—and we trust it may—it is to be hoped that Mr. Curwen will retell this story of a life which is certainly worth the telling.

Of Honoré de Balzac and of André Chénier, to whom the two other chapters of Mr. Curwen's interesting work are devoted, we have left no space to speak. In the monograph of the latter the author, who seems most at home in French literature, has depicted with sparkling vivacity some picturesque episodes of the first French Revolution. As a work of art, we consider his last sketch of the half-dozen the best. It is not often, indeed, that such fresh and piquant volumes pass through our hands as are these *Studies of Literary Struggle*.

JOHN H. INGRAM.

WE understand that the proprietors of the forthcoming issue of Wordsworth's Prose Works have to pay five hundred guineas to the poet's family for their copyright. The subscription price of the three volumes octavo is two guineas small paper, and three guineas large paper, with portraits.

NEW NOVELS.

Katerfelto. By G. J. Whyte-Melville. Illustrated by Lieutenant-Colonel Crealocke. (London: Chapman & Hall, 1875.)

For Sceptre and Crown. Translated from the German of Gregor Samarow. (London: H. S. King & Co., 1875.)

A Foregone Conclusion. By W. D. Howells. (Boston: Osgood & Co., 1875. London: Trübner & Co.)

Warnton Kings. By John Amphlett. (London: Sampson Low & Co., 1875.)

The Harbour Bar. (London: Macmillan & Co., 1874.)

MAJOR WHYTE-MELVILLE has written many novels in many styles, and has almost always managed to be readable, but we are sorry to say that in *Katerfelto* he has turned his powers of management the other way, and has very nearly, if not quite, succeeded in being unreadable. Nothing but the shortness of the book saves it from this unenviable success. To begin with, there is something about it depressingly suggestive of its having been written as letterpress to Colonel Crealocke's illustrations. Again, the subject is one which the author cannot imagine at all. He can draw certain types of men and women of the present day or a few years ago very pleasantly, and with sufficient variety, but *Cerise* should have warned him off the ground of the last century. *Katerfelto* is even duller than *Cerise*. There is hardly a character in it in which it is possible to take the least interest, or which is not a mere stock-type of the most cut-and-dried kind. One brutal eighteenth century parson, one male Hogarthian fribble, one female ditto, one good-natured and foolish young gentleman, one impassioned gipsy girl, are the principal ingredients. The incidents in which they are concerned are certainly connected after a fashion, and that is about all that can be said for them, nor is there any particular reason why the book should come to its actual end, except, perhaps, that Colonel Crealocke's portfolio was exhausted. A list of the illustrations will give a tolerably clear idea of the plot. A duel in an empty room, three pictures of a gentleman and his horse, five of a stag in various attitudes (these are good), the before-mentioned gipsy hearing and seeing something not to her advantage, the gipsy conversing with an ill-favoured person on horseback, a body lying in the snow, complete the catalogue. About the conjuror who (or rather a horse named after him) gives the title to the story there is not very much said, and, indeed, the whole book, if it has any other object than the one already suggested, appears to have been constructed for the purpose of introducing some not very forcible descriptions of West Somerset stag-hunting, and of the glorious country which is the scene thereof.

The English translation of *Um Szepter und Krone*, if it does nothing else, will give the merely English reader an opportunity of becoming acquainted with that famous and in some ways really remarkable book. The translator is undoubtedly right in offering it "not as an ordinary novel." The fortunes of its imaginary personages, Stielow and Wendenstein, Clara and Helena, are not of

a particularly interesting character, and the mysterious Count Rivero is a personage who has rather palled on English taste, though to the Continental mind he seems not to lack savour. Whether it has more interest or value "as a political sketch," is perhaps an open question. Unravellings of political motives and plans after the fact are wont to have little more than historical interest, the whole attraction of the queer form of gambling known as politics lying apparently in divining or attempting to divine the future. We all know how wearisome to the listener and unprofitable to the speaker are exclamations of "If I had only played my king of hearts," and the like. But there is very much in the book which must attract a large and respectable class of English readers. It is a great thing to be privately and personally, as it were, introduced to half the emperors, kings, prime ministers, and commanders-in-chief in Europe, to know the fashion and colour of their eyes and moustaches, their coats, their hosen and their hats. It is true (and this will a little dash the pleasure) that these personages are nine years old, and therefore just a little out of date. But there is one in whom interest still exists, and indeed has increased. It is indeed a joy to know that whenever Prince (here only Count) von Bismarck comes into his wife's drawing-room, a honey-cake, in the shape of a "foaming glass of golden beer" is dexterously set before the redoubtable hero, and to learn in what a very odd way he behaves when he has a little music in that apartment. Everybody plays his part in a good downright manner, just as we should expect. King William is pious, exceedingly pious, his amiable agonies at absorbing Hanover and dethroning his dear cousin suggest a cross between Oliver Cromwell and Mr. Pickwick's fiery captain when he pointed out to his friend that "he must skin him." The late Emperor Napoleon III. is mysterious and no mistake, and the unfortunate Empress of Mexico is very mad indeed, and talks about demons and green flames. If anybody likes the romance of newspapers let them read *For Sceptre and Crown*, by all means. We ought to mention that the translation is decidedly good. Nothing is harder than to keep the German idiom out of a translation from German into English, but in the book before us this feat has been, if not uniformly, at any rate in most cases, accomplished.

Mr. Howells' former books have been good enough to make us take up any work of his with expectations of pleasure. But the goodness of *A Foregone Conclusion* quite surpassed our most sanguine anticipations. Slight as it is in apparent composition, the four figures of which it consists are all conceived with unquestionable originality, and drawn with very great skill. The group consists of two male and two feminine characters. The latter are, perhaps, not quite so good as the former. Mrs. Vervain, the mamma, has something in common with the singularly detestable matrons whom American novelists, with curious cynicism, or still more curious unconsciousness, are so fond of depicting. But she is saved by a something which is quite Mr. Howells' own, and we can only think with admiration of

her own excellent apology for herself and for a somewhat impertinent trifle with her weaknesses, "You are so apt to be heavy if you're not made light of occasionally." Miss Florida Vervain, the daughter, is also a very good sketch, though we fancy that her extraordinary blindness and innocence are just a little exaggerated. But her two lovers, the Venetian priest Don Ippolito, and the American artist Henry Ferris, are of a very different order of excellence. They have the initial merit, if not of absolute novelty, at any rate of novelty most unusual in any matter of the kind. Mr. Ferris is neither the *dilettante* American of the type of Stangrave in *Two Years Ago*, nor the pious American beloved of Miss Wetherell, nor the comic American, who is now an object of loathing to us all. He is a rational gentleman of Anglo-Saxon strain (we must apologise for the antiquated adjective, but we really do not know what to substitute for it), with the due mixture of culture and pigheadedness which is necessary to ensure English sympathy, and he behaves himself altogether like a human being. Don Ippolito is at least equally good, and the odd attitudes which both scepticism and belief assume in southern minds have never to our knowledge been so well displayed. But the finest thing about the book is perhaps the manner in which the contrast between the two is kept up, not with any glaring or theatrical discords, but with a steady undercurrent of difference, never obtrusively displayed, but carried on throughout. We have read *A Foregone Conclusion* once for duty; it will not be our fault if we do not read it again (and more than once) for pleasure.

Warnton Kings transports us into an atmosphere which was more familiar to the novel-reader some years ago than it is now—an atmosphere of curates and rectors' daughters, of school-feasts and virtuous organists. It is an odd book in one way: we get to the last page without being able to obtain the least idea of the personality of the heroine, for we suppose a certain Emily Crookenden to be the heroine, and she certainly is the most shadowy personage we ever met. Mr. Amphlett, however, makes amends by giving us a rather too clear idea of another young lady, Miss Alicia Perry. A damsel who allows her rather pretty Christian name to be corrupted into the horrible word Lishey, and who deliberately seduces (we cannot use any milder word) her father's gardener into marrying her, because she thinks he is heir to some property, is not a nice subject for thought, but she certainly comes within the limits of the thinkable. Yet it would be wrong to conclude that *Warnton Kings* is either a disagreeable or an absolutely uninteresting book. It is by no means without its merit; the characters are alive, though rather stiff in their manifestations of life, and it is far from improbable that its author may do something much better when he gets his puppets to move more easily.

The north-east coast of Scotland appears to be favourite ground with novelists; we think *The Harbour Bar* is the third or fourth book dealing with it which has come under our notice in the last month or two. It has been sometimes said that there is a drawback attending these minute representations

of peculiar and unfamiliar scenery or manners, namely, that their completeness and freshness in one point only throws up and exposes the probable insufficiency and staleness of their plot or general conception. But this objection is certainly unsound, and proceeds from the old fallacy of erecting an ideal standard, to which any given work of art is bound to conform, instead of accepting every such work as good for the goodness that is in it, according to its own profession, or rejecting it as bad because of its failure to come up to that profession. No wise criticism will reject anything good because it is not better, or refuse pleasure for half an hour because it does not last three-quarters. It is very easy to call the deliberate and habitual acceptance of lovely Thais and any other goods which the gods may provide by the hard names of eclecticism, intellectual Sybaritism, and what not; fortunately it is also very easy for the eclectics and intellectual Sybarites to bear these names of reproach. *The Harbour Bar* has a savour distinct enough and peculiar enough to allow it to pass as good, though there is nothing remarkable about the story or incidents. Its distinguishing excellence is the remarkable feeling for scenery which the author possesses, and the singular vividness with which she presents it. Fond as the usual novelist is of local description, the power of adequate representation of the effect produced by ordinary scenery in few words is almost as rare as the poetical faculty, and this power the author of *The Harbour Bar* unquestionably possesses, and has used to good effect. She has some harrowing to do moreover, and she does it in thoroughly good taste, a refreshing rarity in the days when the draughtsmen of the illustrated papers delight us with upturned rows of dead men's boots, and the correspondents of the *Daily News* revel in the agonies of bereaved relatives. Discussions on the Athanasian Creed might perhaps be left out of a novel with advantage, and this is about all which we have to object to *The Harbour Bar*, except that we wish the writer had not introduced the famous and memorable "shorn lamb" proverb, as "the beautiful words of the poet." Do people never read the *Sentimental Journey* now?

GEORGE SAINTSBURY.

CURRENT THEOLOGY.

Die Neuestamentlichen Briefe, geschichtlich im Zusammenhang erklärt. Erster Band—Paulus' Römerbrief. Von Gustav Volkmar. (Zürich: Caesar Schmidt, 1875.)

The Ten Canticles of the Old Testament Canon. Newly translated, with Notes, by the Rev. W. H. B. Proby, M.A. (Rivingtons, 1874.)

The Book of Psalms of David the King and Prophet, disposed according to the Rhythmical Structure of the Original. With three Essays, Map and Illustrations. By E. F. (Longmans, 1875.)

Aids to the Study of German Theology. (Edinburgh: T. & T. Clark, 1874.)

Spiritual Independence, What is It? By Veritas. (Glasgow: James Maclehose; Edinburgh: Edmonston & Douglas; London: Hamilton, Adams & Co., 1874.)

Peace Through the Truth. Second Series. Part I. By Rev. T. Harper, S.J. (Burns, Oates & Co., 1874.)

The Privilege of Peter. By R. C. Jenkins, M.A. (Henry S. King & Co., 1875.)

The King's Highway; or, the Catholic Church the Way of Salvation as revealed in the Holy Scriptures. By the Rev. Augustine F. Hewit, of the Congregation of St. Paul. (New York: Catholic Publishing Society. London: Burns, Oates & Co., 1874.)

A CRITICAL edition of the Epistle to the Romans, with notes and analysis, and perhaps a translation, is one good thing; a plea for a revised version of the New Testament, for use in the German-speaking Evangelical Churches, is very likely another. The first, well executed, would be a valuable support to the second, but the treatment required for the two is different, and the qualifications for treating them perhaps not quite the same. Dr. Volkmar undertakes the first task as though he valued it chiefly as a means to the second; and one could wish he had known how much more the half is than the whole. The only Greek text he gives us is that of the Vatican MS.—neither a facsimile of it nor an edition founded on it, but a reproduction extending even to its itacisms, but made readable with a view to "edification." The translation is rather inconveniently interspersed with analysis; and there is too much of an attempt to read a commentary into it. *Christus-vertrauen* may be a perfectly correct gloss on the Pauline *πίστις*, but it is not a translation of it, if only because it is not the word in Habakkuk: the Epistle may have been written to people whose sole common principle with the author was the belief that Jesus was the "Anointed" of Jewish expectation, but St. Paul uses uniformly the Greek translation of the Hebrew title, not the Grecised form of it found twice in the Fourth Gospel, which for some reason has become popular in modern churches.

The real interest and value of the book lies in its treatment of the critical questions attaching to the Epistle, and especially the most important one, of the origin of the two last chapters. These are pronounced "ein Conglomerat von ächten und spätem Zusätzen," the former being xv. 33—xvi. 2 and xvi. 21—24, while all the rest is referred to the latter class. The main argument for this wholesale rejection is the silence of Irenaeus and Tertullian as to these two chapters, especially of the latter in his controversy with Marcion; and this is no doubt of weight, as is also the difficulty of accounting for the presence of Prisca and Aquila at Rome so shortly after their undoubted residence at Ephesus. But, however reasonable may be the rejection of the chapters, it is what Englishmen at least will think unscientific dogmatism to profess to trace the history of the Epistle from the date of the Apostles' death, and assign the place and (approximately) the time of each accretion. If the Swiss and German churches do decide to omit the passage from their lectionaries, it is to be hoped it will be on more generally palpable grounds than these last.

A more legitimate interposition of the editor's subjectivity is the plea of the irrelevance of much in these chapters to the *Hauptbegriff* of the Epistle; yet this is an argument that admits of being retorted. The relation in which they stand to the rest of the Epistle is (with the exception of the personal greetings) exactly the same as that of c. vi. to the rest of that to the Galatians; this argument, no doubt, has less weight with those who, like Dr. Volkmar, suppose a considerable interval of time between the composition of the two; but, when the similarity of the two works as wholes is considered, the similarity between the two parts cannot be thought unimportant. Again, we have in the Second Epistle of St. Peter an undoubted example of the way that a pseud-apostolic work of the second century was manufactured: it was built up of diluted fragments of really apostolic origin, or at least of ecclesiastical antiquity, and guaranteed by references to the received evangelical history. Now, this analogy does hold good for the most suspicious part of the Epistle, the doxology with which it now concludes (except that the Pauline fragments of which it

consists are not diluted), but it is singularly the reverse with the rest. If the doxology had never been introduced at either of the places assigned to it, would it ever have occurred to any one except Marcion to suspect the intervening passage?

Mr. Proby's volume is in part open to the same criticism as Dr. Volkmar's—that his critical exegesis is too consciously subordinated to a purpose of ecclesiastical reform—in the interest, however, not of liberalism in the German Church, but of conservative Anglicanism. But seeing that he admits that his crabbedly literal translations are not adapted for the devotional use to which he desires the Canticles to be restored, he can scarcely be charged with sacrificing scholarship to edification; and as a scholarly work his book may safely stand on its own merits.

In truth, philological or critical knowledge is not everything in biblical exegesis: long as the Bible has been studied for the sake of its matter, there is still room for light to be thrown on it by diligent and sympathetic study of the books, as even unscientific tradition has given it to us. It is this that gives value to E. F.'s *Psalms of David*: the author is no great Hebrew scholar, but he has read the Psalter in Hebrew diligently, intelligently, and affectionately, until he has gained the same sort of insight into its structure and meaning that Mr. Gladstone may be credited with in his studies on Homer. The first of his three essays, "The Psalms of David Restored to David," would to most people seem a piece of reactionary and ignorant paradox; the third, "The Zion of David Restored to David," will not set at rest the vexed questions of the topography of Jerusalem, though perhaps it may be an appreciable contribution towards them. But on "The External Form of Hebrew Poetry," E. F. has really something to say that he knows better than most men: his translation (founded on the English Prayer Book version) is, in a literary sense, very good; and though he makes no pretension to independent discussion of exegetical difficulties, his appreciation of style sometimes throws light upon them. For instance, he totally ignores the variation of reading or interpretation in Ps. xxii. 17 (16): yet he gives (apparently without knowing that it is wanted) some support to the traditional version by pointing out the inverted parallelism of "bulls," "lion," "dog," and "piercing" to "sword," "dog," "lion," and "unicorns" in vv. 13-17 and 21-22 respectively (12-16, 20-1).

Messrs. Clark's little book on German theology is an admirably planned attempt to translate not the words but the thoughts of the religious thinkers from Kant downwards into a form intelligible to Englishmen. It does much, at any rate, to make German Church history intelligible, and points out its connexion with the successive philosophic schools which are generally known in England, at least by name. Of course, it is natural that the author should represent his own school, Hegelianism of the Right, as the perfect type of which all former systems travailed in birth, and from which all divergence can only end in corruption; he seems scarcely to see, that though Hegel might be sincere and even consistent in his personal orthodoxy, it does not follow but that unorthodox developments might legitimately follow from his premisses. And if Rationalism be defined as the belief that human reason is adequate to the discovery of divine truth, it is hard to acquit a system of it which professes to deduce the doctrine of the Trinity from the conditions of human thought. What most Englishmen who use the term understand by it, is simply the denial of the infallibility of the Bible.

Spiritual Independence is a well-written and, to an outsider, convincing argument that Archbishop Manning's claims under that head are, as he says, equalled by those of the Free Kirk; and that the great Scotch divines of the seventeenth century expressly recognised such jurisdiction of the civil power as exists at present in the Establishment.

Many people thought that "Rev." Mr. Harper (he is aggrieved if the title be omitted) had argumentatively the advantage in his controversy with Dr. Pusey: the truth is that the latter was in a false position in trying to deduce from mediæval theologians a different system from that which history has deduced. Hence few people will sympathise with Mr. Harper's complaint that his opponent has seen the hopelessness of the object for which he commenced his *Eirenicon*; nor will they be glad that he has continued his reply to it. The present instalment is entirely occupied with the rather unsavoury question, how far dispensations from the ordinary laws of marriage are morally admissible—e.g., whether, if Adam were now alive, and Eve not, it would be lawful for him to marry again, having none but his own direct but very remote descendants to choose from. Dr. Pusey may or may not be a great theologian in the scholastic sense; but at any rate he treats theological questions like a scholar, a gentleman, and an Englishman, and is not, like the author of the above illustration, totally destitute of a sense of the ridiculous.

It is almost a relief to meet with any work on the Papal controversy that keeps clear of the unpractical political issues raised by Mr. Gladstone. Canon Jenkins's *Privilege of Peter*, though largely founded on the *Examination of the Briefs of Pope Pius VI.* by Pannilini, Bishop of Chiari in 1787, is a work of the old-fashioned Anglican school, and possesses a high share of that school's characteristic merits. He finds it easy to show that the doctrine of papal supremacy rests on a theory which, applied to the apostolic and sub-apostolic age, is palpably unhistorical; that the Councils of the undivided Church knew nothing of papal infallibility; that the Western Councils of the fifteenth century very practically denied papal irreformability, and that the latter point was conceded by several Popes of the Tridentine age. In the array of evidence on these subjects, one or two seem unfair, or at least overstated, but the coherency of the whole is scarcely affected by them; the facts alleged would be decisive if they stood alone, but, if our belief in questions of ecclesiastical rights or duties is to be rested on Catholic consent at all, there is really a good deal to be said on the other side. Ever since St. Gregory's time, at all events, there has been a Papacy: once concede that it is in any way of divine right that there should be, and churches that are not in communion with the Pope are self-condemned, so that the Catholic Church consists exclusively of those churches that are. The Catholic Church, as thus defined, pronounced its deliberate faith in the Council of the Vatican with at least as much unanimity and decorum as in the Council of Chalcedon: and it may be doubted whether the one decision was less in harmony than the other with the general stream of previous Catholic opinion.

The King's Highway is an argument by a convert from American Calvinism to Roman Catholicism, that candid and unprejudiced acceptance of the teaching of Scripture will lead others to the same change. It is admirable in tone and temper, and by no means wanting in logical power.

We have received Gode's *Biblical Studies (Old Testament)*, edited by Mr. W. H. Lyttleton (Parker); *Materialism*, a Lecture by Dr. Hooppell, of South Shields; the Bishop of Lincoln's *Reasons for Revising the New Lectionary* (2nd edition); and Mr. Ridley's *Bible Readings (the Acts)* (Rivingtons); *Christ and His Church*, Sermons on the Canticles, by Daniel Moore (H. S. King & Co.); *The Shadowed Home and the Light Beyond*, *Meditations for Mourners*, by Mr. Bickersteth (Sampson Low & Co.); *Christus Redemptor*, a very poor cento of miscellaneous devotional readings (Cassell, Petter & Galpin); Chastel's *Christianity in the Nineteenth Century*, which might be interesting if it were not execrably translated (Williams & Norgate); *Sancta Coena*, by Mr. A. W. Clissold, and *Number a Link between the Divine*

and *Human Intelligence*, by Mr. Girdlestone (Longmans); *Character, its Elements and Development* (Speirs); *The Divine Culture of a Human Life*, by Mr. W. Roberts (J. Clarke & Co.); *The Battle and Burden of Life*, by Mr. Baldwin Brown (Hodder & Stoughton); *A Commentary on St. Matthew*, by Mr. G. Scratton (Wyman & Sons); *Bible History (Old Testament)*, by Mr. C. Ivens (Collins's School Series); and the continuations of Canon Norris's *Manuals of Religious Instruction for Pupil Teachers*: the Old Testament ones are rather good. WILLIAM HENRY SIMCOX.

NOTES AND NEWS.

MR. W. T. THORNTON is shortly to publish with Messrs. Macmillan and Co. a volume of essays dealing with various Indian topics of the highest importance, such as the Public Works, the Finance, and the administration generally.

MESSRS. H. S. KING AND Co. will publish at Easter the third and concluding series of *Songs of Two Worlds*. The new volume will contain, among others, three important poems—"Evensong," "In Hades," and an "Ode to Free Rome."

THE Rev. W. G. Carroll, Incumbent of St. Bride's, Dublin, has just published (Hamilton, Adams & Co.) a memoir of Dr. O'Brien, the late Bishop of Ossory, Ferns and Leighlin, with a summary of his writings, a vigorous examination of his religious views, &c.

MR. G. W. REID, the Keeper of the Prints at the British Museum, is engaged, we hear, upon a descriptive catalogue of the works of Marc Antonio.

MR. HALLIWELL, in his lately-published *Illustrations of the Life of Shakspeare*, said that the last chance of finding Shakspeare's papers was to search behind the panellings of the old house of Lady Barnard, the grand-daughter and last lineal descendant of Shakspeare. This house is Abington Abbey, Northampton, which belongs to Lord Overstone, and is tenanted by Dr. Thomas Prichard. At Mr. Furnivall's instance, Lord Overstone and Dr. Prichard have most kindly given leave that the search may be made this season, at such time and in such manner as shall be convenient to the tenant. Mr. Halliwell has generously undertaken to bear the expense of the search, which will be conducted by an architect under his direction; and if success attends his enthusiastic endeavours to exhaust every possible chance of discovering traces of our great poet, the result will be only what the seeker deserves.

DR. RICHARD MORRIS's excellent little shilling English Grammar has been selling at the rate of 2,000 copies a month since it was published. He is now going to write a companion volume to it, a shilling *History of the English Language*—a book which is much needed.

THE text of Mr. Alexander J. Ellis's translation of Helmholtz's *Die Lehre von den Tonempfindungen* is finished. The appendices of original essays by Mr. Ellis are in a forward state, and the whole book will be published next month by Messrs. Longmans.

THE origin of a "good story" is often as obscure as that of a popular legend, and the best anecdotes reappear, *mutatis nominibus*, in successive generations. Mr. C. C. Greville (*Memoirs*, iii. 132) heard from Lord Holland the following story:—

"Tommy Townshend, a violent, foolish fellow, who was always talking strong language, said in some debate, 'Nothing will satisfy me but to have the noble lord's head; I will have his head.' Lord North said: 'The honourable gentleman says he will have my head. I bear him no malice in return, for though the honourable gentleman says he will have my head, I can assure him that I would on no account have his.'" The repartee is certainly older than Lord North's time, and we have seen it attributed to Harley,

who is said to have made this rejoinder to Lord Coningsby (see Townsend's *Leominster*). Very possibly it belongs to an earlier date, and certainly has rather an Elizabethan, or at least Cromwellian flavour about it.

WE hear that *The Italians*, by Mrs. Elliot, which we reviewed two or three weeks ago, is to appear in a French translation in the *Revue britannique*, and in Italian as a *feuilleton* in the *Gazzetta del Popolo*.

TENNYSON'S *Idylls of the King* have just been translated into Swedish under the title of *Konung Arthur och hans riddare* (King Arthur and his Knights).

MR. CHILDERS is half through U with his Pali Dictionary, and expects to finish the book in August. When complete it will contain ten thousand words, with quotations from and references to seventy thousand passages from printed texts and manuscripts.

WE learn that under the careful management of its librarian and bursar, the Rev. W. Milman, and his predecessor, Sion College has been entirely freed from the old heavy debt which crippled it. A Bill is now before Parliament to develop its resources and add to the value of its property. With the passing of this a prosperous future to the College will be secured.

WE understand that Mr. W. C. Hazlitt will send to press forthwith a supplement to his *Handbook to the Popular, Poetical, and Dramatic Literature of Great Britain from the Invention of Printing to the Restoration* (J. R. Smith, 1887), and that this supplement will contain the titles and collations of a very large number of rare early tracts and books which have been examined by Mr. Hazlitt and his helpers since the issue of his *Handbook*.

WE hear that Mr. Arber hopes to issue to his subscribers soon after Easter the second volume of his important bibliographical work, the *Transcript of the Stationers' Registers, 1554-1640*. This work is the foundation-stone of English bibliography.

THE abstract of Du Cange prepared for Mr. Murray's *Lexicon of Mediæval Latin*, founded on Du Cange, has reached the letter S.

PROFESSOR DELIUS is expected in London on Monday the 15th inst.

THE adoption of English books in the lecture rooms of Continental Universities is a circumstance sufficiently gratifying. Some years ago we heard of Gibbon's great work being used as a text-book at Bonn; Mr. Lecky's *History of European Morals* was, we believe, employed for the same purpose in the same class. Now, we learn from Paris that M. Michel Chevalier has announced his intention of using Mr. Macleod's *Principles of Economical Philosophy* for his lectures in the Collège de France.

SOME friends of Mr. G. J. Holyoake have instituted a public subscription for his benefit. By this means it is hoped that he will be raised above the necessity of engaging in other work than he desires, and freed from personal solicitude in doing it. Mr. Holyoake is in many ways a remarkable man. The pathetic story of his early days has been recorded in his *History of the Last Trial for Atheism in England*. Beside his claims as the founder of Secularism—admittedly the religion of many of the most intelligent of the working classes—he has aided by tongue and pen in many good movements. He was the last person indicted for publishing unstamped newspapers, and his *History of Co-operation in Rochdale* had a marked influence in the development of the modern forms of co-operation. Mr. Holyoake has never squared his convictions to popular standards, and has on various occasions suffered in consequence. An original thinker, with a habit of speaking out,

could hardly avoid this. His many years of ill-requited service to education and social science, merit recognition, in which even those may join who do not endorse his views.

CAMOENS and the literature called forth by the *Lusiad* and other writings of the great epic poet, form the basis of a most interesting collection of publications now on view at Messrs. Trübner and Co.'s, in Ludgate Hill, under the head of *Camoeniana*, and consisting of some 400 volumes. Among the most precious gems in the collection are the two works of the poet which were issued just previous to his death—the first edition of the *Rhythmas*, printed at Lisbon in 1595, and the *Lusiadas* of 1597. There is also a copy of the rare Lisbon edition of 1609, unknown to Souza-Botelho, Brunet and Graesse. A little volume in 64mo, the Lisbon edition of the *Lusiadas* of 1651, is perhaps all but unique. Its existence is doubted by Silva, the eminent bibliographer, and it was unknown to Brunet and Graesse, nor was it in the collection of Sir Thomas Norton or Mr. Adamson. But the collection has many other books of nearly equal rarity: the first Latin translation by Bp. Thomas de Faria of 1622, the first Italian version by Antonio Paggi of 1658, both printed at Lisbon, and the latter unknown to Brunet, among the number. There is also a beautiful copy of Souza-Botelho's splendid folio edition of the *Lusiadas*, printed at Paris in 1817, presented by the editor to the late Lord Cowley when ambassador at Madrid.

WE regret to see announced the death of Mr. Robert Hardwicke, the publisher, whose valuable publications on natural history and other scientific subjects are well known to our readers.

ACCORDING to a writer in the *Temps* of the 3rd inst., the authenticity of the *Mémoires de Sanson*, of which we announced the speedy appearance of an English translation, is not altogether beyond suspicion. If this story is correct, about the year 1860 a certain M. Dupray de la Mahérie established a printing-office on novel principles near the Bazaar Bonne-Nouvelle; and, like some other inventors of novel principles, found a sensation of some sort absolutely necessary to his well-being. After long cudgelling his brains in vain, one of his staff, named D'Olbreuse, at last hit on the happy idea of Sanson's Memoirs, and Dupray at once flew to Sanson, who was then alive, and offered him 30,000 francs in exchange for some notes, which he readily agreed to furnish, but of which not a syllable was ever seen. The first three or four chapters of the first volume were entirely written by D'Olbreuse, but at this point the unimaginative biographer broke down, and the services of a novelist were secured, who however, stipulated that he was to be excused from writing the sixth volume, containing minute details as to the acts and personal characteristics of Sanson, as he did not particularly care to be brought into direct relations with a member of Sanson's profession. At last the "MS." of Charles Henri Sanson was delivered; the first edition only sold fairly, but the illustrated edition proved a great success, and enabled Dupray de la Mahérie to pay for his enterprise—30,000 francs to Sanson, 12,500 to the novelist, and 5,000 to D'Olbreuse. Sanson was at the time of the concoction of his memoirs in poor circumstances; he had a bad memory, and the mild and paternal air of an old bourgeois. He made, however, great pretensions to noble birth, and according to his family tree, drawn up by himself, he was descended from ancient Norman bannerets established at Abbeville in the fifteenth century, and claimed as his kinsman Nicolas Sanson, the geographer. The truth appears to be that a Sanson first became public executioner at Paris in 1685, and that from that year to 1847 the office remained in the family. In 1847 Sanson found himself overwhelmed with debt, and was sent to Clichy, but obtained his liberty by pledging to his principal creditor the woodwork of the guillotine. A few

days after he received orders to proceed to the execution of a criminal, and the creditor refused to lend him the guillotine, but was persuaded to surrender it on payment of the 3-4,000 fr. due to him by the Garde des Sceaux, who immediately afterwards relieved the insolvent executioner of his functions. As to his Memoirs, no doubt, says the writer in the *Temps*, the novelists who assumed their paternity have here and there respected the truth of facts; but it was pure concession on their part.

LAST week died one of the most voluminous writers of the present century, who during a literary life of over fifty years is said to have produced about 150 volumes. John Timbs was born in London on August 17, 1801, and spent his school-days in Hertfordshire, where he first learned to love the country. In 1815 he was articled for a term of six years to a printer and druggist in Dorking. He here made the acquaintance of Sir Richard Phillips, the enterprising bookseller and author, whose amanuensis he afterwards became. Under Phillips's auspices he commenced his literary career, and wrote in 1820 for his employer's *Monthly Magazine* "A Picturesque Promenade round Dorking," which was published separately in 1823. This little book contained an account of actual wanderings in that charming neighbourhood, and was its author's first and last original work. Timbs has been called "an industrious and ingenious compiler" and also "a painstaking antiquary;" the first he certainly was, and the last he as certainly was not. His *Curiosities of London* contains a mass of information not easily to be obtained elsewhere, and had he bestowed greater care upon it he might have produced a work of lasting value. One of his most popular books was *Things not Generally Known*; and the *Anecdote Biography*, *London Clubs and Club Life*, and *Romance of London* found many readers. In 1871 he published his Autobiography in the *Leisure Hour*, which contained chatty notices of people who had lived in his time, and of places with which he had been connected. A list of Timbs's separate works would not give a complete idea of his labours, for beside these he edited the *Mirror* from 1827 to 1838, and in 1839 he commenced his *Year Book of Facts*. From 1842 to 1858 he was one of the editors of the *Illustrated London News*, and to its pages he contributed much chit-chat on "popular" antiquarianism. On the death of Mr. Ingram Mr. Timbs's services were dispensed with, and it is said that the new proprietors offered him a pension of 40*l.* a year, but feeling that this was an inadequate acknowledgment of his work in improving the paper, he refused it.

M. CHARLES BIGOT has been writing in several numbers of the *Siècle* an interesting and elaborate study on the works of Hector Malot, who is now recognised as among the most masculine and robust of living French novelists. M. Bigot, in his excellent articles, does ample justice to the range of his author's power and its genuineness, but he does not omit to indicate that a certain want of passion and high imagination must prevent M. Malot from taking rank among the novelists who may be called great. His style is vivid and realistic, but not elevated. He is a careful and accurate observer of many phases of life; wanting a little in sentiment and sensitiveness, but almost invariably vigorous and healthy.

THE *Journal des Débats* of the 9th instant has a short obituary of the late M. Emile de Bonnechese who died on February 15. He was best known in this country by his *History of France*; but he was also the author of a tragedy entitled *Rosemonde*, performed at the Théâtre Français, a poem on the *Death of Bailly*, crowned by the Academy, a *History of England*, *Christophe Sauval*, ou la *Société en France sous la Restauration*, and, most important of all, *Les Réformateurs avant la Réforme du XV^e Siècle*, *Gerson*, *Jean Huss*, et le *Concile de Constance*. M. de Bonnechese was born in Holland at the beginning of the present cen-

tury, when it was a French province under the title of "République batave."

DON GREGORIO CRUZADA VILLAAMIL has published a work on Rubens as a Spanish diplomat, his travels in Spain, and notices of his paintings, illustrated by documents from the archives of Simanca, &c.

THE *Revista de España* in the course of a eulogistic review of the second edition of the *Filosofía de Interés personal* of Don Mariano Carreras y Gonzalez, sketches the history of political economy in Spain. Dr. Sanchez de Moncada proposed in 1619 the establishment of chairs of Commerce in the universities, and a professorship of Politics at Madrid was decided upon in 1625, but never carried into execution. In the last century the commercial juntas and societies of political economy gave an impulse to the study, and were instrumental in banishing many abuses. The teachings of the professors on luxury, usury, population, etc., were not very pleasing to moralists of the Inquisition type. The study of political economy first appeared in the official list of studies in 1807. Various modifications have occurred since then. In 1857 the establishment of schools of commerce gave a fresh impetus to the science.

IBSEN's *Haermaerdene paa Helgeland* has at last been brought out on the stage of the Royal Theatre at Copenhagen, and with great success. The papers are quoting Heiberg's words when this play, and Björnson's *Halte Hulda* were first offered to the Danish Theatre in 1858. So far from perceiving that these two works heralded a new and vigorous epoch in poetry, he said that "the Norwegian theatre will scarcely progress amid the manufacture of such experiments as these; the Danish, happily, need not regard them." As Heiberg, masterly critic as he was, lacked appreciation of the old sagas so utterly that he thought that there was "nothing so monotonous, tiresome, and empty of all poetry in the whole of literature," it is not surprising that he sneered at the drama that took all its inspiration and more than half its form from them.

M. TOMIZEY DE LARROQUE has just reprinted in the sixth volume of his "Collection Méridionale" (Paris, Claudin, only 100 copies printed) the *Oeuvres de Jean Rus, Poète bordelais de la première moitié du XVI^e Siècle*. Of the first edition, which was published at Toulouse about 1540, only one copy is known. J. Rus, though a follower of Marot and of Mellin de Saint Gelay, possesses originality of thought, and his verses are easy and graceful. His very name was unknown to the historians of French poetry. The edition of M. Tomizey de Larroque is perfectly satisfactory.

WE have received *The Dramatic Works of William Shakespeare*, edited by S. W. Singer, vol. iv. (Bell & Sons); *The Rights of Women* (Trübner); *The British Army in 1875*, by John Holms, M.P. (Longmans); *The Statesman's Year Book for 1875*, by F. Martin (Macmillan); *Debrecht's House of Commons and the Judicial Bench*, 1875, edited by R. H. Mair (Dean & Son); *Burghclere Sunday-School Exercises*, 1848-58, edited by the Bishop of St. Andrews, second edition (Parker); *A Few Comments on Mr. Gladstone's Exposition*, by Henry Canon Neville (Pickering); *The Patent Question in 1875*, by R. A. Macfie (Longmans); *A New Metrical Psalter*, first published in 1831, now revised and republished, by Bishop Trower (Parker).

THE following Parliamentary papers have lately been published:—"A Digest of Statutes relating to Merchant Shipping" (price 3*s.*); "Report of the Commissioners of Church Temporalities in Ireland" (price 6*d.*); "Further Papers relating to the Kafir Outbreak in Natal," two parts (price 1*s.* 2*d.* and 8*d.* respectively); "General Annual Return of the British Army for 1873" (price

6d.); "Appropriation Accounts of Civil Services and Revenue Departments" (price 4s.); "Reports from H.M.'s Consuls on the Manufactures, &c., of their Districts," part i. (price 1s. 7d.); "Emigration to Brazil, Report on the Colony of Oananea" (price 2d.); "Correspondence respecting the Outrage on Mr. Magee, British Vice-Consul at San-José, Guatemala" (price 6½d.); "Final Report of Commissioners on Master and Servants Act, Criminal Amendment Act, &c." (price 4d.); "Report of the Expedition sent by the Government of Natal to instal Cetywayo as King of the Zulus, in succession to Panda" (price 4d.); "Observations on the Report of Mrs. Senior to the Local Government Board on Girls at Pauper Schools," by E. C. Tufnell, Esq., late Inspector (price 3d.); "Further Correspondence respecting the Capture of the *Virginus*" (price 1d.); "Twenty-second Report of Charity Commissioners," "Annual Report of Railway Commissioners," "Returns, &c., relating to Charitable Funds, Duchy of Lancaster, Navy, Civil Contingencies, Woods, Forests, and Land Revenues, Duchy of Cornwall, Paupers, &c.," "Reports on the Silk Industry in India, and on the Supply of Timber in the Burmah Markets" (price 1s. 4d.); "Langalibalele and the Amahlubi Tribe," by the Bishop of Natal (price 1s. 10d.); "Further Papers relative to a proposal to substitute Gas for Oil in Lighthouses" (price 8d.); "First Annual Report by the Accountant to the Board of Education for Scotland" (price 7d.); "Ninth Annual Report of the Registrar-General of Marriages, Births, and Deaths in Ireland, 1872" (price 9d.).

NOTES OF TRAVEL.

WE have already mentioned that the results of Lieutenant Payer's Arctic expedition are about to receive illustration in this country, by the publication of a series of twelve photographs from his very effective sketches. They will be published by Mr. Frederick Bruckman, of Henrietta Street, Covent Garden, and will consist of the following subjects, with descriptive letterpress:—1. The Separation of the *Tegethoff* and the *Isbjorn*; 2. The Attempts to save Provisions and Boats; 3. Sunrise between Novaya Zemlya and Francis Joseph Land on February 16, 1873; 4. The *Tegethoff* drifting with Ice; 5. Snowstorm on the Ice during the Polar Night; 6. Seizure of a Dog by a Bear; 7. Burial of Engineer Krusch on Wilczek Island; 8. Payer's Journey by Sledge; 9. Halt near the Open Sea; 10. Abandoning the *Tegethoff*; 11. Boats among Broken Ice; 12. Rescue of the Party by a Russian Vessel.

THE untimely check to the Yunan Expedition, the despatch of which we announced some weeks ago, is much to be regretted on every account. We also have to deplore the murder of Mr. Margary, of the Chinese Consular Service, a gallant and accomplished young explorer, who had traversed the whole width of China from Shanghai to Blamo, in order to join the expedition. The murderer, Lee See Hie, is half Burmese and half Chinese, and it is possible that the Chinese Government will succeed in evading responsibility for his crime. But there can be no doubt that steps must be taken to give him and his savage followers a severe lesson. The expedition had no political aim whatever, and was despatched entirely for exploring purposes, and as a pioneer to commerce. It is, however, much to be regretted that Mr. Ney Elias was not placed in command, instead of being relegated to the second place. If his knowledge and other qualifications were indispensable, they would clearly have been made more useful had he been placed in a position to use them to the best advantage. But jobbery seems to be the inevitable accompaniment of any enterprise that is organised by a government department. Mr. Ney Elias strongly recommended that the land route direct from

Mandalay should be adopted. It passes through the territory of a chief who defies the authority of the king of Burma, but who is friendly to the English, and hence the opposition of that potentate to its adoption. That opposition would have been overcome by a firm negotiator; and the present disaster would never have occurred. There is strong reason to suspect the King of Burma of guilty complicity, or at least of a guilty knowledge, of the intended attack.

THE *Débats* observes that a taste for travel and exploration, scientific or commercial, appears to be on the increase in France. MM. Marche and de Compiègne, who have only just returned from their travels in equatorial Africa, are preparing to return and to penetrate through the country of Ogowé to the Congo; M. Duveyrier is taking up the schotts of Algeria; Dr. Harmand is at Marseilles waiting to embark for Cochin China, whence he will visit the Kmer country; M. Largeau is already in the Sahara. Another member of the Geographical Society of Paris, M. Levallois, is preparing to visit a point in the Dutch Indies hitherto almost unknown from the industrial, agricultural, and scientific point of view.

Im *Neuen Reich* draws attention in a recent number to a curious circumstance which has recently occurred in Tunis, and which very forcibly recalls to mind the altered political and social status of the North African maritime powers since the days when Algerine corsairs and Tunisian pirates were the scourge and terror of Christian seafarers. It would appear from the statement of the Arabic paper published at Constantinople, under the name of *El-Djeraib*, that Tunis has fallen into such a hopeless state of pecuniary embarrassment and administrative disorganisation, that a sale has been effected there—without the knowledge of the chief authorities—of a large number of old European cannon and firearms of various kinds, which had been preserved for ages in the crumbling forts and dismantled watch-towers of the Tunisian territory. These trophies of the victories of the Infidels over the fleets of Sicily, Naples, Sardinia, and other neighbouring States, which are of great historical interest, and were in many instances artistically valuable from the beauty and special character of their workmanship and mode of construction, were sold for less than the crude value of the metal; and it is a matter for regret that an opportunity was not afforded to the Governments of civilized Europe of redeeming these curious relics of a bygone age of maritime adventure. Unfortunately, however, the purchase of these pieces of ordnance was effected by private individuals, who had no other object in view than to obtain the metal of which they were composed as a bargain, and it is said that they succeeded so admirably in this respect that they purchased the entire number at 1 fr. 50 c. the kilogramme.

THE interesting discussion, or rather contest, which has been going on for some time between Professor Adler of Berlin, and Dr. Sepp of Munich, with regard to the true architectural origin and history of Omar's Mosque at Jerusalem, seems to have been brought to an end—for the present, at all events—by the decision of the Society of Architects and Civil Engineers at Berlin, to which an appeal had been made by both parties. According to the verdict of this tribunal, Dr. Sepp has demonstrated to apparent certainty that we first hear of a church of St. Sophia on Solomon's Mount under the Emperor Justinian; and that this edifice, which according to the testimony of Anthony of Placentia, enclosed a rock within its walls in the year 570, is not merely the prototype, but the identical building, which is now, after its assumed founder, known as the Mosque of Omar, and which encloses a mass of rock more than 60 feet in length and nearly as many feet in breadth. According to Dr. Sepp, this church is spoken of in the Koran as the temple of the rock of David, and must

have been known to Omar through the description of the prophet, when he visited it after the taking of Jerusalem in 637. The Order of the Knights Templars took its origin from this building, and held in veneration the stone-altar, known as David's, on which, according to tradition, Abraham had prepared to sacrifice Isaac: and on this account it was regarded with the highest esteem both by Moslems and Christians. Abd-el-Medschid, of the Omajades, and other Khalifs, added the Alsa and different parts to the original church; but it would appear from Dr. Sepp's researches that the central and main building enclosing the rock is of far higher antiquity than the period of its earliest use by the followers of the Prophet.

A RECENT consular report from Christiania contains an edifying account of an improved kind of harpoon used in the whale fishery. It consists, we are told, of a harpoon with two moveable barbs like the claws of an anchor, one on each side, and is projected from a swivel gun fixed on the bows of the vessel. The claws or barbs lie flat against the harpoon while in the gun, and during its progress through the air and entrance into the body of the fish; should, however, the line attached be hauled, or the fish take a start, the barbs expand and become fixed at an angle of 45°. In addition to this, a capsule containing an explosive substance is concealed in the harpoon, which by some ingenious contrivance explodes and causes instant death. The patentee of this most valuable instrument is one Mr. Foyn, of Tonsberg, who is said to have caught fifty "fish" with its aid last year, the estimated value of each being about 150l.

OFFICIAL accounts from the island of Key West, Florida, allude to a project now on foot for connecting the island with the mainland by a railway across the line of reefs. Engineers pronounce it practicable, and should it be carried out it will vastly increase the importance of the place by making it the chief outlet for American produce to the West India Islands and South America. The harbour of Key West is considered one of the best within the limits of the United States to the south of the Chesapeake. Cigar-making was begun here six or seven years ago, and now forms the principal industry; there are seventeen manufacturing, and about 1,200 men, women, and children employed in them, among whom the best workmen earn as much as nine dollars a day.

SIR ARTHUR HELPS.

SIR ARTHUR HELPS, who died last Sunday, was one of the small number of men who come very near the perfection of themselves; it may be said, too, that what came so near perfection in him was what most of us are apt to think an imperfection in ourselves. In the most characteristic series of his works, of which *Friends in Council* is the centre, he is persistently occupied with a rationale of things which most think it a gain not to think about; how to do things that most do well or ill, and are done with; how to mitigate the surprises and avoid the regrets which meet us by the way, for which most think callousness the only remedy and the best. Throughout, the vein of his speculation is coloured by a view that if we would but take up the little difficulties of life and deal with them, the great ones would melt away. He did not treat the weariness of detail and the reluctance to spend thought in articulating statements that border upon truisms as facts to be reckoned with, but as mistakes to be corrected, as, indeed, the sensitive eagerness of his mind, however it was disciplined into patience, always led him to see much more clearly that in life which is modifiable, than that which is fixed. But within its range, his perception was singularly clear and accurate, and there can be little doubt that it was heightened by his keen disinterested sensibility to all concrete discomfort. Perhaps his great talent for the con-

crete did something to keep his mind in the byways of thought and affairs; the highways of both are paved with abstractions. There is a certain change to be noted in his attitude towards larger questions; in *Essays written in the Intervals of Business*, and in *Companions of my Solitude* he is urgent to have large questions thought, out in the earlier scenes of *Friends in Council* the discussion continually stops short on the threshold of them; in his later works there are signs of a certain distaste for them, as if they called us away from the more pressing and more manageable questions that grow out of the daily needs of human fellowship. There is hardly any other substantial change in his work: the ideas are always of the same order, though the vehicle and ornaments may vary. In *Essays written in the Intervals of Business* we have something of the quaintness and gravity of Bacon; in *Companions of my Solitude*, most of the ornament comes from a delicate appreciation of external nature, in the later works he depends more upon a diffuse ingenious playful way of setting forth how the views he enforces with such wistful earnestness will strike fair samples of the cultivated public; latterly a pessimist was included among these. The whole of the series is written in the pure, lucid, flexible English which is rapidly becoming a dead language. His knowledge of affairs makes itself felt in two ways in his largest and not least considerable work, *The History of the Spanish Conquest of America*. It gives a curious actuality to the parts which in most histories are slight or dull, and it prevents him from exaggerating, as most historians do, the responsibility of Cortes and Pizarro for the sufferings of the Indians; he knew too well how much goes wrong in the hands of officials without their fault. The history is not complete; it omits all the internal economy of the Spanish settlements; but it deals in a masterly way with the course of the conquest and the successful efforts of the Spanish Government to save the continental Indians from the settlers. His poem of *Oulita the Serf* is an imaginative expression of what seemed to him the most pathetic in life; his later prose fictions *Realmah* and *Casimir Maremma*, were in the main the expression of his hopes—he sets himself in both to think what could be done for a young society by good direction, though the scene of one is laid in “the stone age,” that of the others in the nineteenth century. In *Ivan de Biron* the chief interest is to be found in the generous defence of the grotesque and beneficent Empress Elizabeth.

G. A. SIMCOX.

NEW YORK LETTER.

New York: February 1875.

We can match the dispute that is going on in your art world over the pictures of Mr. John Linnell, Sen., with one that has just ended here over a pretended original repetition by Henri Regnault of his *Salomé* (which shared with Zamacois's *Education of a Prince* the honours of the Paris Salon of 1870). There has been for a long time carried on in this city a regular manufacture of forged pictures, the victims being always painters of our own time, mostly Frenchmen, though a few Düsseldorf and other German artists are to be included. The men who support this enterprise with their money, and give their time to its management, are, I am sorry to say, people who call themselves respectable, and who would be by no means pleased if one were to deny them the name of gentlemen. But I think it would puzzle a wise head to draw a line between them and the ordinary forger. They keep a number of poor hack artists busy in copying the work of popular painters, they then forge the signature of the original as skilfully as they can, and as each batch is finished it is taken to a well-known shop in Liberty Street, where the copies are sold by auction as originals. Generally, one of the most respectable-looking of the gang—a grey-haired but youngish-looking old *beau*—is

among the buyers, and keeps things stirring with his connoisseurish comments and notes of admiration; but since he was exposed lately by name in one of the newspapers, and his tricks and his manners described, he has “taken his leave for a little space,” as the old Prologue has it.

As a rule, this notable firm flies at small game, but about a month ago they announced a sale of pictures, and in the lot the original *Salomé* of Regnault! This was a daub of a copy, a little more than a quarter the size of the true original (which was the size of life), and apparently painted over a photograph thrown up on the canvas from the photograph published by Goupil. The *Daily Graphic*, of this city, was the first to detect and expose the trick attempted to be played upon the public. But two leading journals, one a daily newspaper, the other a weekly journal, both making great pretensions to culture, were grossly fooled, and described this very poor copy of a famous picture in terms that could only have been justified by the original. On the morning of the sale, however, the *Tribune* declared that the picture was “an impudent forgery,” and the result of its warning was that the auctioneer, after furiously blackguarding the newspaper for its truth-telling, withdrew the picture from the sale, at the same time declaring, in spite of the printed catalogue, that it had never been pretended that this was the original picture. Here the matter would have ended if some one had not raked up and sent to the *Tribune* a criticism in no less a journal than the *Zeitschrift für Bildende Kunst*—I think it was in May, 1872—of a replica of the *Salomé*, purporting to have been found in the studio of Regnault after his death, and then on exhibition at Karfunkel's Gemälde-Galerie in Berlin. This criticism was a match for the New York newspaper articles, for the writer, who confessed he had never seen the original, went into aesthetic ecstasies over the variations from the original with the true zeal of an amateur. No sooner was this discovery announced by the *Tribune* correspondent than the auctioneer rushed into print with a letter declaring his replica and Karfunkel's were one and the same, and that he had written to Paris for evidence to prove it. But the *Tribune* had also written letters to Paris, and a few days ago it published the answers it had received. Two of these letters, one from M. Durand-Ruel, the other from M. George Clairin, declare positively that Regnault made no preliminary study for the *Salomé*, “nor any copy of it whatsoever;” that consequently there was no such copy found in his studio after his death, and of course Karfunkel's “masterpiece of the first rank,” for so the *Zeitschrift für Bildende Kunst* described it, was a copy of some one else than Regnault. Best of all was a letter from Karfunkel himself, written to a dealer in this city, and declaring that he still held the “masterpiece,” and would be glad to sell it, or to send it to be sold on commission. So that unless a miracle has been wrought, our New York auctioneer can never prove his assertion that his picture and Karfunkel's are the same. A point to note in M. Clairin's letter is, that Regnault's pictures are all the time being forged. M. Clairin has even been offered the original sketches for the *Prim* and the *Execution in Granada*, though Regnault, he declares, made no sketches at all for either picture. The *Tribune* has deserved well of the public for the persevering energy with which it has hunted down these rascals and exposed their game.

The Intercollegiate competition which culminated at the Academy of Music in New York recently, has fulfilled, I believe, the expectations of its promoters, who consider it a good and encouraging beginning at least. Those of your readers interested in such matters have doubtless ere this learned the particulars of the Academy's proceedings. It should be understood that this is part of a general movement for the combination of our colleges with reference to examinations—the ultimate aim being a system of intercollegiate ex-

aminations at New York year by year, and of intercollegiate fellowships based on the result of these. The scheme was suggested to Mr. Thomas Wentworth Higginson, the author of the magazine article out of which the movement grew, by his observation of the good results in England of the University examinations for “scholarships,” and the test brought to bear through this means on the great English schools. The scheme has, indeed, been objected to on the ground of its being English. The preliminary competition in elocution and English composition was deliberately planned as easiest to begin with. Next year examinations in Greek and mathematics are to be added, and after that they will probably be yet further extended. Outsiders, without convictions and in search of knowledge, point questioning to the fact that neither Harvard nor Yale has joined the association, and ask, “Why have so many colleges kept out?” To this the friends of competition reply, “Better ask why so many came in! Beginnings are not seldom small. Eleven colleges belong to the association, and these include, observe, the best second-best colleges in the country. After Yale there are none of higher rank than Princeton and Cornell, and each of these surpasses Harvard and Yale at some points. These two colleges have by no means the degree of comparative importance that attaches to Oxford and Cambridge in England.” Whether or not the system of intercollegiate competition is wise, it is not for me to discuss here. There can be no doubt, however, that the minds of scholars are more and more occupied with the subject of the higher education; and there is more than one practical scheme on foot looking in this direction; notably in Baltimore, where President Gilman, of California, has been invited to carry out his peculiar views.

The Hon. Maunsell Bradhurst Field, a gentleman almost as well known abroad as he was in this country, died in this city after a lingering illness on January 25. Mr. Field was a man of liberal education, and would probably have made a brilliant career if he had not unfortunately been born rich. As it was he spent his days on the outer edge of greatness. He was Secretary of Legation to Hon. John Y. Mason when that gentleman was Minister at the Court of France, and during the last years of his life was judge of the Second Judicial District Court in this city. Mr. Field was a diplomat by nature, and had a large political acquaintance, of which he tells a great deal that is interesting in his *Memories of many Men and some Women*, published not long since. He first met Louis Napoleon in the library of that distinguished physician, Sir Benjamin Brodie, in London, where the two gentlemen passed some time in pleasant conversation. When they next met Napoleon was Emperor of the French.

On Friday night last Ambroise Thomas's *Mignon* was sung in New York for the first time in English. The opera was given by the Kellogg English Opera Troupe, Miss Clara Louise Kellogg singing the title rôle, and I may safely say that it was the most poetic interpretation of that character ever witnessed in this city. She invested the part with a new interest, and sang the music with rare intelligence and refined sentiment. Her *Mignon* was Goethe's heroine—neither the rollicking gypsy of the French version, nor the lovesick child of the Italian. There was a passion and a tenderness in her singing of the song “Knowest thou the land,” and the prayer in the last act, that was as new as it was beautiful. She sang the *Styrienne* in the second act with brilliancy and vivacity; in a word, her conception was original and picturesque, and has been received with marked favour. Miss Kellogg's troupe has been giving the best Italian operas this season, most of which were adapted to the English stage by the *prima donna* herself. Balfe's *Talesman* will be sung for the first time in America by this company during the coming week.

Dion Boucicault has been playing in his new

comedy, *The Shaughraun*, every night since November 14, at Wallack's Theatre, and there are no present signs of abatement in the public interest. If Mr. Boucicault ever acted with greater delicacy and freshness, I have not happened to meet anyone who remembers it.

I have left myself small space in which to speak of an interesting literary event that took place here last week, when Nicholas Udall's *Ralph Roister Doister* was given by some young people as a public amateur performance. Probably it would never have occurred to any one here to do this, if Mr. Edward Arber's cheap and pretty "Reprints" had not made copies of the play easy to get. This series has been very popular here, and is much used in our better schools and colleges. Udall's comedy proved to be an excellent acting play, witty and wise, the plot well contrived, and carrying the action briskly along. The acting was excellent, but nature and talent were greatly helped by the thorough drilling the players underwent at the hands of Mr. Calvert Vaux, and the result was a performance that passed off with delightful ease and smoothness.

CORRESPONDENCE.

MR. JAMES FERGUSON AND ST. PAUL'S CATHEDRAL.
 Westminster: March 8, 1875.

The future historian of St. Paul's Cathedral will have no easy task in the chapter which relates to the twenty years beginning with 1858. Beside the alterations and re-alterations which have been made, he will have to chronicle the controversies, not to say quarrels, which have raged over many of them, and to record the proposals for alterations which have not been carried out. One of these last is far too curious as an illustration of the chaotic state of architectural thought at the present time to be allowed to fall into oblivion. It is that proposed by Mr. James Fergusson in a printed letter accompanied by plans and sections, and addressed to the Dean, a copy of which letter now lies before me.

Mr. Fergusson divides his letter into three parts. The first contains his opinions about Wren's building, and the proposals which have been made by others with respect to it, mixed up with a good deal of talk about himself; in the second he describes the alterations which he would have made; and the third is devoted to an attempt to justify these alterations, and to show that if Wren were now living he would approve of them.

Of the outside Mr. Fergusson is pleased so far to approve that he does not think he can mend it except in one way, of which more anon. The inside, however, does not suit him at all. Nothing is right in it, and he is especially offended at the presence of an attic over the principal order, and at the nave arches encroaching on the space which the entablature of the same order would, if continued, have occupied. Mr. Fergusson's arguments against the attic are anything but conclusive. The other fault may be more real, but, granting that it is so, the remedy proposed is a good deal worse than the disease. The want of *scale*, which is the chief architectural defect of the interior, is due more to the great size of the principal order than to anything else, and it certainly would not be lessened by the suggested cutting away of the present order and substitution of one ten or twelve feet higher. The strictures on the disproportion in width between the dome-space and the choir would be just, if Wren had intended that they should form parts of one apartment, as now by the alterations they do; but were of no force so long as his screen stood separating the two, and forming the termination of the first apartment and the entrance to the second. Similarly the present inconvenience of the building is no fault of Wren's. He suited the requirements of his own time, and now that new requirements have risen he is not to blame because they have been badly provided for. That the new requirements exist is not to be disputed, and the need of properly meeting them next occupies Mr. Fergusson. He glances at a scheme proposed by Mr. Somers Clarke and myself, whereby the old choir would be put back to its original state, and the dome space separately furnished. Though what he means by saying that the choir would be "used as a Lady chapel," I know not. We never proposed anything so foolish, and I never heard of anybody else doing so. But let that pass. Next he condemns, *more suo*, a plan on the same principle suggested by Mr. Street, and accepted by Mr. Burges; and then, after some rather characteristic abuse of the latter gentleman, he passes on to the description of his own design.

This, at least, has the quality of boldness, though whence inspired may be questioned. Putting it in his own words, he proposes "to remove the four piers of the choir, and the roofs they support, and to replace the latter by a dome 90 feet in diameter and 140 feet high, internally resting on octagonal pendentives." That is to say, he takes away the whole of Wren's choir from the great dome to the apse, and substitutes for it a new building of his own designing. The outer walls, indeed, he leaves standing, but pierces new windows in them, and inserts into them pilasters of polished red granite at the angles of his new octagon. The new dome is somewhat flat, and has small windows at its base; a sort of engine-turned ceiling, and a large skylight, glazed with ground glass in the middle. Mr. Fergusson is fond of ground glass; somewhere he suggests that it should have cut ornaments upon it. The apse, although allowed to stand, is disguised internally, to correspond with the new work. In front of its pilasters are placed ten granite pillars, ranging with the principal order, and carrying nothing but pieces of entablature and statues of the moderate height of twelve feet. The drawings indicate wall-decorations of various sorts, amongst which are open books scaling four feet across, and shields of arms five feet high. Externally the new dome would appear as a sort of hump east of the great dome, and it is this notable addition which, according to Mr. Fergusson, is all that is required to make the exterior of the church perfect. One does not like to be severe on the work of an amateur, and I will therefore leave the description without comment, although Mr. Fergusson's treatment of such as disagree with him is not such as to entitle him to much mercy. But it is rather amusing to notice that the end of all the destruction and alteration

is to leave the great dome still unused, and to produce in the new work a reduced reproduction of the arrangement, which, when proposed to be placed under the great dome without altering a line of the original design, Mr. Fergusson passes over as scarcely worthy of notice.

The point of the third part of the letter is this. Wren made several designs and carried out one of them, but not that which he liked best. Mr. Fergusson thinks he sees points in common between his own proposal and Wren's favourite scheme; therefore he claims to be carrying out Wren's intentions. I will venture to put the same argument in rather a homely way. Suppose Mr. Fergusson wanted a blue coat, but force of circumstances compelled him to have a green one instead, would he consider it a carrying out of his original intention if some one were to remove one of the laps of his green coat and sew on a blue one in its place?

Mr. Fergusson's proposal has just one good quality, which is that it is so outrageously extravagant that there is not the least chance of its ever being entertained; and his name is so prevented from going down the stream of time linked with those of Herostratus and Jonathan Martin.

J. T. MICKLETHWAITE.

CAPTAIN MARRYAT A PLAGIARIST.

Old Brompton, S.W.: March 6, 1875.

At the end of my letter of the 26th ult. I asked the question, "Is anything known of Beloe's friend Dr. Russell, and his volume of Arab tales brought from Aleppo?"

My esteemed friend F. W. Burton, Esq., F.S.A., has answered a part of my query in the following manner:—

"I wish I could tell where that volume is now. But as to its possessor in Beloe's time, he was, without much doubt, Alexander Russell, M.D. (from 1742 to 1753 resident at Aleppo, apparently as physician to the British Consulate there), who after his return published in 1756 *The Natural History of Aleppo and Parts Adjacent*, 4to (Millar, Strand, 1756), giving an account of the district, the people, and their diseases, and the fauna and flora of the neighbourhood—a still interesting book, of which I have a copy."

Mr. Burton adds: "It would certainly be very interesting to discover the MS. tales; perhaps they are in the British Museum."

II. C. COOTE.

SHAKSPERIAN VERSE-TESTS.

Trinity College, Dublin: March 5, 1875.

In his letter on Metrical Tests for Shakspeare in the last ACADEMY, Mr. Fleay says that I have fallen into error in my application of the weak-ending test to *Pericles*, "from having used one of the wretchedly arranged modern editions." Will you allow me to say that the text of *Pericles* which I used, and on which my conclusion respecting that play is founded, is *Mr. Fleay's own*, as printed in vol. i. of the Transactions of the New Shakspeare Society?

JOHN K. INGRAM.

OUR OLDEST MS. AND WHO MUTILATED IT.

Oxford: Feb. 9, 1875.

As my paper was written in ignorance of what Dr. Maassen had said on its subject, and as I saw no reason for altering it after consulting him, I was not bound to refer to him in any way. In one sense I assent to his work being characterised as a "great work," for ponderous it is; and so far as "the mass of evidence which it contains" is concerned, it is a boon to literature. Otherwise, his arrangement is anything but lucid; and his inferences now and then, in my opinion at least anything but trustworthy. On the MS. to which my paper refers I consider he has thrown much more shade than light; but as this is a point which concerns its intrinsic merits rather than its excised leaves, I shall only repeat that my paper

deals solely with the volume which has been so treated; and this, in spite of the retort made by Mr. Renouf "that the three volumes were originally one." It has escaped my learned opponent that the volume containing the letter of Dionysius is shown by the numberings to be the last of the three; that it contains no canons at all; nor is any part of it supposed to be by the author of the *Prisca Versio*. That it is written in the same character I admit; that it was written by the same scribe, or at the same time, as the excised volume, I deny. That it is heterogeneous to both this and the other, its subject-matter alone proves. Numbers of MSS., its parent the Theatine included, exhibit the same phenomena.

"Its parent the Theatine," do I say? Its grandchild rather—I am here borrowing from Mr. Renouf. The Theatine, I should say, in spite of his positive assurances to the contrary, was not to be named in the same breath with the Justel. I am, indeed, so unfortunate as never to have seen it "proved," I won't say "to demonstration," but within an ace of probability, that the "so-called *Prisca Versio* of the Nicene canons is no version at all, but a compilation of two more ancient texts," viz., those named in the next sentence. Further, I never asserted that the Sardican canons, as they stand in the Justel MS., had been translated from the Greek. I simply said their position there gave colour to the opinion that they had been. But, then, "the whole of this rests upon exploded error." Thus, it seems, I am to consider myself exploded, whether I hold or dissent from that opinion. This is hardly sound logic. Again, have we sound logic in what follows? I had called this MS. "the oldest MS. of the oldest collection of canons in Latin known." This is denied. "The collection to which it belongs is not the oldest known, or even the oldest but one." How is this last proved? There are two Latin versions of the *Nicene decrees* known, which are older. Be it so, for the moment; but what follows? As one swallow does not make spring, so neither do the decrees of one council form a collection. But to go back to the Nicene decrees. I should like particularly to see the Latin "version sent by Atticus to the African church," though I have no doubt at all about there having been another older than that: for the decrees were recited in some shape or other by the Africans, before Atticus was even applied to. But where is *either* version extant in any reliable form? When I said "known," I meant extant, of course, not "known of." As to the collection of the Theatine MS., to talk of its being the parent of the *Prisca* sounds to my mind pure nonsense. The two MSS., as I have said before, to my mind hardly admit of comparison. The Justel MS. is in uncials throughout; the Theatine is not even in Lombardic throughout, and "characterum Lombardicorum forma satis saeculum viii. prodit" is what Thiel says of it. The collection of canons in the Justel contains only canons supposed to be genuine, and none later than A.D. 450: the Theatine contains, I believe, many documents of a much later date, and some confessedly spurious. But its *earliest* part includes canons that were not in existence before A.D. 499. As to its version of the Nicene decrees, I described this in my paper as "a bolder gloss on the *Prisca*, than the *Prisca* is itself on the original:" and from that judgment I see no cause to recede. The Ballerini, no doubt, in more than one place speak of its version of these decrees as earlier than that of the *Prisca*, but as they have been so good as to supply me with the means of collating both collections, and of comparing them with the Dionysian, they have put it into my power to qualify their conclusions. So that while I can bear them out in maintaining the version of the Justel MS. to be the actual one revised and called "*Prisca*" by Dionysius, I can show against them that the version of the Theatine MS., so far as it deals with the same canons, is simply that of the *Prisca* throughout, altered in places by glosses or clerical errors. There was

abundance of time for the *Prisca* to have been glossed upon, or altered otherwise by scribes, between the fifth and eighth centuries.

As to the Theatine combination of the Sardican canons in consecutive numbers with the Nicene, I think I may safely challenge Mr. Renouf to exhibit any MS. earlier than the eighth or ninth centuries where this arrangement is followed, seeing that neither De Marca nor the Ballerini could. It was to supply this desideratum, which he had already confessed indispensable to his hypothesis, that the former risked mis-describing an unpublished MS., and the latter availed themselves of his mis-description in one place, though they took him to task for it in another.

It is morally certain that he refers to the same MS. in both the passages I have quoted from him. He has characterised it as "*antiquissimus*" in one, and "*vetustissimus*" in the other. Neither Justellus, his contemporary, nor the Ballerini, his critics, entertained any doubts about this MS. being meant by him in both. It was the celebrated unique Justel MS. so familiar to all the collectors of councils from Labbe to Mansi, and church-historians to Gieseler; and, in fact, the whole pith of his misrepresentation lay in the "*consequentibus numeris sub antiquo titulo*." It was this one inaccuracy that impeached his honesty; there was no other that need have been dwelt upon had this been away. It was perfectly true that this MS. contained twenty-seven canons of Chalcedon, though not last of all. It was perfectly true that the Sardican canons followed the Nicene there, and together made with them just forty-one. What was culpably false was, that they followed them in consecutive numbers, and under their ancient title. As I said in my paper, it was he, not Justellus the younger, who would have been damaged by the publication of the Sardican canons unmutated and entire, just as they stood in this MS. He, not Justellus the younger, *forcibly* stayed its publication, till he could *compel* its being published on terms dictated by himself, and could likewise silence explanations from every mouth but his own. Just on two points he was baffled, and only two: 1. He had decreed that the two excised leaves that were to be printed should be printed *in fronte collectionis*. The editors in all probability did this by the first copy—the sole copy that is without them in their proper place—and this page, having served its purpose, was omitted or lost by the binder. Two leaves have been abstracted from the duplicate copy now before me, since binding, at the very same point. The editors contrived that all the other copies should exhibit the excised leaves in their proper place. 2. The editors secured their MS. against any further harm by sending it over to this country with two more of the excised leaves that had not been destroyed, yet had not been printed. Mr. Renouf has hazarded the conjecture that the MS. may have been imperfect before Justellus became possessed of it. This may apply to other parts of it. As regards these, we possess ocular proof. Anybody who cares may see for himself that all the missing leaves of the Sardican canons must have been abstracted at the same time, and in the same way. And what is it that De Marca himself tells the Pope? "The *Sardican canons* I knew had been cut out of this MS. by Justellus the elder, *with the leaves, however, removed to the end of the volume*." But what follows? "I desisted not, till partly by threats and partly by prayers, the Sardican canons were restored in the printed copy to their proper place after the Nicene, as they stood in the MS." Does he *not* stand convicted on his own showing? Was this the honest way of describing what had really been done? Could any Pope have divined that "the Sardican canons" were represented in the printed copy by the miserable fragments that are made to do duty for them; and contrary to, be it observed, and *not* in conformity with, the express bidding of the Archbishop, in the place occupied by them in the MS.? Or could Alexander VII. have reconciled the

epitaph composed for the rest, *vetustate perierunt*, with what he was assured had been done by them? Wiser than truthful in his generation, the Archbishop took good care that his own treatise mis-describing this MS. should not appear so long as he had any control over it. In an evil hour for his posthumous fame, but in stern justice to truth, it was published.

Mr. Renouf, I am certain, would not, for a thousand archbishoprics, countenance such miserable tamperings with truth, as he, with chivalrous generosity, does his utmost to prevent being brought home to a renowned dignitary of his church, and one whose learned works must always command respect. EDMUND S. FFOULKES.

March 3, 1875.

The amount of work which has accumulated upon my hands during the compulsory idleness occasioned by some days' illness prevents my entering very minutely into Mr. Ffoulkes' reply to my last letter.

His judgment on Dr. Maassen's great work is sufficient to explain our relative positions towards each other in the present controversy. In Germany the history of ecclesiastical law is the study, not of amateurs as in England, but of men who apply to it a rigour of method which in this country is rarely met with except in works on physical science. Dr. Maassen's book represents the most advanced stage of the science; and I follow the most eminent scholars in Germany, beginning with Savigny, in looking upon its arrangement not only as perfectly lucid, but as the only suitable one for such a work. In contending with Mr. Ffoulkes, I have generally to deal with arguments which have long since been obsolete.

I. Mr. Ffoulkes now denies my assertion that the three volumes of the Justel MS. were written by the same hand. In his article (p. 140) he had described the first and second as "transcribed in the same character and *probably by the same hand* as the contents of the second volume." The fact to which he now calls my attention as inconsistent with this had not escaped me, for I had meant to quote it against him. How can the "heterogeneous" character of certain portions of this collection be an argument against its *unity*, when, as he very justly observes, "numbers of MSS. . . . the Theatine included, exhibit the same phenomena"? Maassen has shown that four ancient Italian collections (of which the Justel is one), perfectly independent of each other but nearly akin to each other, are characterised by a similarity of plan which leads one to infer, not only that the "heterogeneous" contents belong to it, but that a series of decretals were formerly to be found at the end of vol. iii.

II. "I should," says Mr. Ffoulkes, "particularly like to see 'the Latin version sent by Atticus to the African Church,' though I have no doubt at all about there having been another older than that. . . . But where is *either* version extant?" I will tell Mr. Ffoulkes. On looking at p. 903 of his Maassen, he will find the version of Caecilianus of Carthage critically edited from MSS. Of the Latin version made by the presbyters Philo and Evarestus, and sent by Atticus of Constantinople, there are two texts; one corrupt, which is contained in Hardouin (i. p. 1245) and Mansi (i. p. 407, ed. 1700), and another published by Gonzalez from much purer MSS. in the Madrid edition of the *Collectio Canonum Ecclesiae Hispaniae* (tom. i., col. 169). The latter book is not, I believe, common in this country, but it is reprinted in Migne's Collection, tom. lxxxiv.

III. Mr. Ffoulkes "has never seen it proved" to his satisfaction (and he speaks as if he had never heard) that "the so-called *Prisca Versio* of the Nicene decrees is no version at all, but a mere compilation of two more ancient texts." The demonstration of this fact could not be given without exhibiting three distinct and complete texts of the Nicene canons; but anyone who will take the trouble to make the comparison of

these texts will see that my assertion is a correct one. Three texts—A, B, and C—are given, the problem being to determine the relation of A to B. The history of C is perfectly well known. It is found that A and B are in general exactly alike, except where B borrows from C. It is surely manifest that A is the earlier text, and B a compilation from A and C. Such is the case of the so-called *Prisca Versio* of the Nicene decrees. So far is the *Codex Theatinus* from giving "a bolder gloss on the *Prisca* than the *Prisca* is on the original," that the "*Prisca*," as a rule, differs in no respect from the Theatine text except when it borrows from the version of Philo and Evaristus. What Mr. Ffoulkes considers a gloss is simply the original Latin text.

The passage quoted from the Ballerini, to the effect that the Theatine MS. "non totam *Priscan* editionem continet," &c., is not accurate. The Theatine MS. contains the whole of the "*Prisca*." This term, I repeat, involves an exploded hypothesis of Justel, adopted by De Marca and others.

I never said or imagined that the Theatine collection was the parent of the Justel collection. I said that the Theatine version of the Nicene canons was the parent of the corresponding Justel text, and really had a higher claim to the title of "*Prisca*." I mentioned some other evidence of its antiquity, and I now add that this same text is the basis of that quoted by the Roman legate, Paschasius, Bishop of Lilybaeum, at the Council of Chalcedon.

IV. Mr. Ffoulkes thinks he may safely challenge me to exhibit any MS. earlier than the eighth or ninth centuries, where the Sardican and Nicene canons follow in consecutive numbers. If De Marca considered this "desideratum" as indispensable to his hypothesis, it was a very foolish thought, and I am astonished to find it revived at the present day. It is absolutely certain that such MSS. existed in the fifth century, for St. Jerome and his contemporaries never quote from any others. No one now thinks of basing a negative inference on the mere date of a MS. The text which it contains may possess criteria of antiquity quite independent of the time in which it was written. Some cursive and by no means very ancient MSS. of the New Testament are quite equal in value to those written in the most magnificent uncials. They are, in fact, *copies* of very much older MSS. As regards the question now before us, three perfectly distinct periods are to be recognised: 1. That in which the Sardican and Nicene canons were united under one title; 2. That in which the Sardican were known, in consequence of the African controversy, not to be Nicene, their real origin being left in uncertainty; 3. That in which the Sardican are known and recognised as such. The publication of the collection of Dionysius Exiguus greatly contributed to the spread of correct views on the subject. But old collections continued to be copied, and the MSS. of which Mr. Ffoulkes thinks so cheaply represent, as far as this question is concerned, the views current before Dionysius.

V. I am loth to add another word to what I have said about De Marca's intervention in the publication of the Justel MS. Those who are acquainted with the science of books will judge whether my theory or that of Mr. Ffoulkes best explains the phenomena of the existing copies of the *Bibliotheca Juris Canonici* of Voel and Justel. I will only say that the notion of De Marca's having anything to do with the mutilation of the MS. is in flagrant contradiction with the testimony of the truthful Baluze that the manuscript was brought in his presence mutilated to De Marca by the editors, who loudly declared that the pages which they were forced to publish were no real part of it. The assertion that "the editors secured their MS. against any farther harm by sending it over to this country" is a most unjustifiable piece of romance.

Finally, I disclaim the imputation of "chival-

rous generosity" in taking up arms for a renowned archbishop of my Church. There are two things at least much more important to me than the reputation of De Marca—namely, scientific method and historical truth. If any "archbishop of my Church" wilfully sins against these, I shall, far from taking up arms in his defence, feel the utmost delight at his falling into the hands of the Philistines.

P. LE PAGE RENOUF.

[This controversy must end here.—EDITOR.]

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, March 13, 3 p.m.	Royal Institution: Professor Clifford on "The General Features of the History of Science."
"	Crystal Palace Concert (Jonchims).
"	Saturday Popular Concert, St. James's Hall (Billow).
3.45 p.m.	Royal Botanic.
MONDAY, March 15, 1 p.m.	Sale at Christie's of the Collection of Old English Porcelain of H. G. Bohn, Esq.
3 p.m.	Asiatic.
7 p.m.	Entomological.
8 p.m.	British Architects' Medical.
"	Monday Popular Concert, St. James's Hall (Mdlle. Krebs, Joachim).
TUESDAY, March 16, 3 p.m.	Royal Institution: Mr. A. H. Garrod on "Animal Locomotion."
7.45 p.m.	Statistical.
8 p.m.	Civil Engineers' Pathological.
8.30 p.m.	Zoological.
WEDNESDAY, Mar. 17, 1 p.m.	Horticultural.
7 p.m.	Meteorological.
8 p.m.	Society of Arts.
THURSDAY, Mar. 18, 3 p.m.	Royal Institution: Professor Tyndall on "Electricity."
4 p.m.	Zoological.
6 p.m.	Philosophical Club.
7 p.m.	Naturalistic.
"	London Institution: Professor Ella's Third Musical Lecture.
8 p.m.	Linnean. Chemical.
"	Society of Arts: Mr. G. S. Tenison on "First Principles in Art Study."
"	Mr. Coenen's Third Concert, St. George's Hall.
8.30 p.m.	Royal. Antiquaries.
FRIDAY, March 19, 7.30 p.m.	Sacred Harmonic Society, Exeter Hall (St. Paul).
8 p.m.	Philological. Professor J. Payne on "The Norman Element in the Patois of the Midland Area."
9 p.m.	Royal Institution: Dr. R. Liebreich on "The Real and Ideal in Portraiture."

SCIENCE.

The Polarization of Light. By W. Spottiswoode, F.R.S. Nature Series. (London: Macmillan & Co., 1875.)

PROBABLY few branches of natural science of equal importance, or of equal interest to the general reader, are so poorly provided with text-books, advanced or elementary, as that of Light. It is with great pleasure, therefore, that we have received this contribution towards filling up the gap. The only treatises so far practically accessible to the English student were Airy's Tract on the Undulatory Theory, and Lloyd's Wave Theory of Light. The latter forms a very excellent history of the science, but is very difficult to the general, and not satisfying to the mathematical, reader; the former is entirely a mathematical treatise, omitting, however, the full development of Fresnel's theory of double refraction. The present little book is eminently suited to supply the want of an elementary text-book on the polarization of light—and it is to be hoped that we shall ere long possess a treatise combining both experimental and theoretical details.

The book had its origin in a series of lectures delivered by the author, and its only serious fault is one to which a book so produced is especially liable, viz. the introduction of merely illustrative matter which will catch the attention of an audience, but which in a book is distinctly bad if it diminishes the space available for a full development of important principles.

The author begins by describing some of the methods of polarizing light, and so leads his readers to a clear notion of the polarization of light more easily than would be possible by starting with a formal enunciation. A very complete and lucid account is next given of the colours observed when polarized light is transmitted in parallel rays through crystal plates, and then analysed. The explanation of these phenomena necessitates an account of the wave theory and of the principle of interference. This is not followed into its more intricate consequences, but the explanation of the diminution in the intensity of the colours with increase in thickness of the plates is rendered beautifully simple by the aid of the spectroscope, which is introduced whenever it is capable of rendering manifest the nature of the light under investigation.

This is followed by a really excellent chapter on circular polarization, all the more valuable as being on a branch of the subject which is rather liable to neglect, or at any rate to less attention than its importance deserves, both when considered in its practical applications to the construction of optical instruments, and for the curious relation, discovered by Sir J. Herschel, which holds between the faces of a crystal and the direction in which the plane of polarization is turned by it.

A portion of the seventh chapter has been devoted to the polarization of the atmosphere, in which the general results of Professor Tyndall's investigations have been given, with a description of some of his beautiful experiments. Why, however, has no mention of the neutral points been made? The discovery, also, made in a recent balloon ascent, that the blackness of the sky, as spoken of by previous aeronauts, was a delusion resulting from physical exhaustion, suggests the importance of examining the polarization at great elevations. The chapter on the phenomena observed when crystal plates are examined in divergent rays is good and rich in matter, although from the necessity of condensing so much into one chapter, and also from the inherent difficulty of the subject, it is far the most difficult one. It is, perhaps, fortunate that it does not meet the reader at an early stage as, in addition to what has been just said, several strange words, certainly of great convenience, have been introduced into it, the meaning of which would be clear to an audience witnessing the phenomena, but whose meaning ought to have been more clearly given in the book. Thus "*stauoscopic figure*" is used to denote the figures consisting of coloured rings with dark or light brushes, and this is said to be "*euthysymmetrically divided*" when it is divided into two similar portions by a straight line. Among other things which are good, about the best portion of the chapter is that relating to the optic axes

of biaxial crystals, the dispersion of which in the case of oblique crystals is very well classified according to the three classes called by French writers *croisée*, *inclinée*, *horizontale*. A table is likewise given of the limits between which the optic axes of a considerable number of crystals are inclined to one another. The information contained in this table is, I believe, to be found in no other book, and has evidently been compiled with great care from the various memoirs in which the original observations are to be found. In treating of this part of the subject it is difficult to know how far the phenomena are to be treated as belonging to polarization or to double refraction. Ordinarily all the phenomena shown by crystal plates have been described together, and if this had been done in the present case, conical refraction would have found a place. This would not have been in strict keeping with the title of the book; but as double refraction when separated from polarization would form so extremely small a book that it is hardly likely to be brought out in a popular form, I think it is to be regretted that place has not been found for so interesting a phenomenon, which has supplied so striking a proof of the truth of Fresnel's theory. W. J. LEWIS.

DR. J. E. GRAY, F.R.S.

SCARCELY had Dr. Gray quitted the position which he so long held at the British Museum before the melancholy news reaches us that his active life has been brought to a close. It is indeed but a few brief weeks since Dr. Günther was appointed to the Keepership of the Zoological Collections upon the resignation of Dr. Gray, who had occupied this post since 1840.

John Edward Gray, the son of Mr. F. S. Gray, of Walsall, was born in 1800, and educated for the medical profession. At the age of twenty-one he published his *Natural Arrangement of British Plants*, a work which has the merit of being an early attempt to introduce the natural system to the notice of British botanists. Three years later he entered the Natural History Department of the British Museum, and rose in 1840 to the rank of Keeper. A fine series of catalogues of the collections has been issued under his care, many of the departments having been described by himself; thus, only a few months ago he brought out his *Hand-List of Seals, Morses, Sea-Lions, and Sea-Bears*. But in addition to these official publications, and to the large number of his communications to learned societies and scientific serials, he found time to write such works as *A Manual of British Land and Fresh-Water Shells*; *Illustrations of Indian Zoology*; and *The Knowsley Menagerie*. Years of concentration upon the minute shades of difference necessary for the identification of species scarcely tend to broaden a man's views; but it should not be forgotten that Dr. Gray, in addition to his labours as a systematic zoologist, exercised himself in the discussion of wide questions of social importance, such as public education, prison discipline, the postage system, and the organization of museums and galleries of art. His claims to public notice, however, must rest upon the half-century of scientific work which he honestly devoted to the service of his country. F. W. RUDLER.

SCIENCE NOTES.

PHYSIOLOGY.

Abiogenesis.—The noise of the spontaneous generation controversy has all but died out; occasionally, however, an echo of it still challenges

notice. Huizinga (*Pflüger's Archiv*, x. 1) publishes an additional paper on the subject, in which he endeavours to parry the objections made against his previous researches. The experiment on which he appears to lay most stress is this: a solution containing peptone, inulin, pure glucose, and the necessary mineral salts, is boiled in a glass vessel which is closed, during ebullition, by a cover of porous earthenware, luted on with asphalt. The sealed vessel is then placed in an incubator, and kept at a temperature of 40° C. After three days the clear liquid is found to have become turbid, and to swarm with living organisms, chiefly *Micrococcus* and *Bacterium termo*. Solutions containing only two of the above ingredients (peptone and glucose, or peptone and inulin), when treated in exactly the same way, remain free from any trace of life, though affording every facility for the rapid multiplication of microphytes. The absence of organisms in the solutions containing only two of the three ingredients whose conjunction is essential for the *de novo* production of bacteria, is regarded by the author as furnishing better security for the germlessness of the materials employed than the exposure of the test-liquids to high temperatures in a Papin's digester. Two reasons are advanced for this opinion: in the first place, peptone and inulin undergo chemical change when heated to 110° C., and such change may diminish or destroy their nutritive capacity; secondly, the precise temperature required for the thorough destruction of all schizomycetous germs is very uncertain. As regards the latter point, Huizinga finds himself constrained to admit that the absolute destruction of bacteria and their germs, when suspended in a watery medium, cannot be depended on unless the liquid has been maintained at a temperature of 110° C. for thirty minutes. This conclusion is equally at variance with the statements of observers who are in favour of abiogenesis (Bastian), and of those who are adverse to it (Cohn).

A number of very careful experiments bearing on this point are described by Roberts (*Studies on Biogenesis, Philosophical Transactions*, Part II. for 1874). He found that all the organic liquids he employed could be rendered permanently barren by exposure to a temperature of 100° C.; but that the duration of such exposure had to be varied in each case. In other words, slight differences in the aggregation of the materials used, or in their reaction, were sufficient to alter very considerably the amount of heat required for their sterilisation. Degree of heat and length of exposure were found to be mutually compensatory; prolonged exposure to a temperature of 100° C. being as effectual as a shorter exposure to greater heat. The germs of bacteria offered more resistance to heat than those of torulaceous organisms. Hay infusion, rendered slightly alkaline, was found to exhibit the maximum degree of resistance to sterilisation by heat. The juices and tissues of plants and animals never originate organisms unless previously contaminated from without. The general conclusions at which Dr. Roberts arrives are decidedly favourable to the doctrine of panspermism as opposed to that of abiogenesis; nevertheless, on the strength of a few exceptional and unexplained facts, he is disposed to believe in the possibility of an occasional, though very rare, development of organisms without pre-existing germs.

On a Peculiar Butyric Fermentation.—It has been ascertained that the function of the torulaceous organisms by which alcoholic fermentation is set up may also be performed by the living cells of some larger plants, when these are placed under abnormal physiological conditions. Schützenberger (*Comptes Rendus*, January 25, 1875) describes a somewhat analogous phenomenon. A vessel filled with a five per cent. solution of cane sugar, and containing several stalks of the *Elodea Canadensis*, is kept at a temperature of 20°–30° C. and shielded from direct sunlight. After some hours, the cane sugar is found to have been partially transformed

into inverted sugar. Bubbles of gas are seen to adhere to prominent parts of the plant, from which they become detached, and rise to the surface. In about ten hours the gases come off so rapidly that 100 cubic centimetres may be collected in thirty minutes. When analysed, they are found to consist of hydrogen and carbonic acid in nearly equal proportions. The liquid grows more and more sour, and exhales an odour of butyric acid and ethyl butyrate. If neutralised with soda, the butyrate of that base may be isolated. The liquid contains neither bacteria nor vibrios—none of those organisms which Pasteur regards as the special butyric ferment, and which are present during the butyric fermentation of milk. If some of the liquid be decanted while the fermentation is going on, the action ceases in the decanted portion; it will only progress in contact with the *Elodea*. Some other water-plants and even marine algae have been observed to operate in a similar manner.

On the Presence of Copper in the Human Body.—The recent condemnation of Moreau for poisoning his wife with a salt of copper has given fresh interest to the question whether copper is normally present in the organism. MM. Bergeron and L'Hôte, the experts on whose evidence the verdict was based, have investigated the point with great care (*Comptes Rendus*, January 25, 1875). The fact that copper, when introduced into the system through the alimentary canal, accumulates in the liver and kidneys—a fact known to Orfila—served as a starting-point for their enquiry. These organs were analysed in fourteen cases, whose history made it practically certain that no copper compounds had been swallowed for a considerable period before death. They were invariably found to contain traces of the metal, varying in amount from a quantity incapable of being numerically estimated (in a young man of seventeen) to one of two milligrammes (in the body of a man aged seventy-eight). The conclusion is, that when the total mass of the liver and kidneys contains more than three milligrammes of the metal, it must have been introduced into the system in unusual quantity. The traces normally present are attributed by the authors to such accidental causes as the use of copper utensils for cooking, etc.

Rate at which Excitation travels along Voluntary Muscle.—Hermann (*Pflüger's Archiv*, x. 1) points out that the results obtained by previous enquirers are vitiated by their having employed muscles whose continuity is interrupted by tendinous intersections, and by their adoption of the graphic method. His own experiments were all made with the sartorii muscles of the frog. The mean velocity deduced from a considerable number of observations was 2.698 metres per second. No difference was found to exist between curarised and non-curarised muscles. The velocity thus determined is only approximative; no such experimental precision being possible as in the measurement of the velocity of nerve-force.

Analysis of the Heart's Impulse.—The tangible beat of the heart against the chest-wall, which seems to our unaided senses to be a simple and momentary phenomenon, has been shown by the cardiograph to be a complex result of various conflicting forces, and to coincide in duration with the entire systole of the ventricles. To analyse the elements of which the cardiographic tracing consists, it is advisable to select the relatively simple heart of the land tortoise, which will continue to beat for a considerable time after its removal from the body if its cavities are kept supplied with defibrinated blood. Its pulsations are perfectly regular, and much slower than those of the human heart. Graphically recorded, its contractions furnish a comparatively simple curve. Marey (*Comptes Rendus*, January 18, 1875) regards this curve as a product of two factors; the change of volume which the heart undergoes during its alternate contraction and relaxation; and the changes in its consistency, the

organ being firm during systole, flaccid during diastole. These two elements may be graphically recorded independently of each other. By enclosing the heart in a flask with three tubulures, one of which serves for the introduction of blood into its cavities, another for the escape of the blood, while the third places the air contained in the flask in communication with a registering apparatus, we get a curve showing the alternate condensation and rarefaction of the air caused by the alternate increase and diminution in the volume of the heart. Another curve is obtained by recording the variations of pressure in the interior of the ventricle, which will obviously coincide with the changes of consistency due to its contraction and relaxation. The two curves vary inversely, one rising when the other descends, and *vice versa*. Superposition of the two yields a compound curve, essentially resembling that obtained in the first instance by the cardiograph.

MICROSCOPICAL NOTES.

M. VON TIEGHEM has just brought before the French Academy some interesting experiments on the fecundation of certain fungi (*Basidiomycetes*) confirming the statements of M. Reess, to which he refers, and throwing fresh light on the interesting question of sexuality in these lower organisms. M. Reess made his observations on the common dung fungus *Coprinus stercorarius*, and M. von Tieghem selected for his *Coprinus ephemeroides*. Placing a spore of this little agaric in a decoction of dung, and confining it in a cell, under the microscope, he found it soon germinated, producing a branched cellular mycelium, anastomosing, not only from branch to branch, but from cell to cell, along each branch; the branches being about 0.003 mm. in diameter. In most cases the mycelium tubes produced, in the course of five or six days, tufts of narrow rods (*baguettes*), springing, sometimes to the number of twenty, from the tip of a short lateral branch. Each of these rods divided itself into two smaller ones (*bâtonnets*). The upper one detached itself and fell away; the lower one grew at its base and divided again. When this had gone on two or three times, the basilar joint fell off, and there remained only a pedicel and a great number of small white rods lying by it. These were 0.004 mm. to 0.005 mm. long and 0.0015 mm. wide, and often having a brilliant granule at each end. When these rods were sown in the dung decoction they did not germinate.

In another set of similar experiments, no rods appeared, but about the seventh or eighth day—that is to say, when the little rods in the contemporary experiments had separated from the stems, certain lateral branches swelled at their summits, forming large vesicles, separated by partitions from the pedicels bearing them. Sometimes these vesicles, which contained a dense protoplasm and usually exhibited three vacuoles, grew in loose tufts. M. von Tieghem, having thus obtained the little rods and the vesicles in separate growing cells, brought them together, and saw the “rods” attach themselves to the vesicles, and empty into them their contents. The vesicles thus fecundated lost their vacuoles, formed two internal divisions, and transformed themselves into large tubes composed of three superimposed barrel-shaped cells. The basilar cells, which were the longest and narrowest, soon pushed out curved lateral branches, and were followed by the median cells. The branches, which were multicellular and ramose, pressed against each other and formed a little white tubercle, the beginning of the fruit. Further details will be found in *Comptes Rendus* for February 8, 1875.

A FUNGUS of a different character continues to excite much interest and alarm in India on account of the damage it occasions to the opium crop. It is a near relative of the potato blight, and is named *Peronospora arboreascens*. It forms the

subject of “Microscopical Notes,”* by Dr. Cunningham, who was not able to throw much light upon its habits, but is still pursuing the investigation. He found that soaking fine sections of the poppy leaves in carmine solution enabled the mycelium threads, which took up the colour, to be traced running between the cells, but not in any case perforating them. The *conidia*, which crop out abundantly from the fertile filaments on the under surface of the leaves, he states, “appear very rapidly to lose their power of germinating.” He was unsuccessful in his search for the *oogonia* and *oospores*, supposed from analogy to exist in these fungi and spring from the mycelium in the tissues of the plant. Oospores can preserve their germinating power for months, and are conjectured to be important means of propagating the *Peronospora* moulds. As the *Peronospora arboreascens*, or poppy mould, is common on wild poppies in this country, English microscopists may contribute to the further elucidation of its life history.

PASSING to quite another subject, we notice in *Comptes Rendus*, February 8, a paper by M. A. Villot on the “Peripheral Nervous System of Marine Nematoids.” It states that the connexion of the tactile papillae of these worms, and of their eyes, with a nervous system has been hitherto obscure, and M. Villot finds that when the worms are rendered transparent by maceration in a mixture of acetic acid, alcohol, glycerine, and water, a thin, granular, highly refracting layer is seen beneath the cuticle. This was described by Dr. Charlton Bastian in 1866, who observed that it contained cellulose. Each of these cellulose sends a delicate thread to a papilla, and distributes lateral prolongations to adjacent papillae. “The subcutaneous layer of these marine Nematoids contains a veritable network of ganglionic cells, which supply more filaments to the tactile and visual organs, and this peripheral network is related with the central nervous system through a plexus which traverses the muscular layer, and connects the ventral nerve with the subcutaneous layer.” M. Villot alludes to a similar arrangement in sea anemones, and to his own discovery of it in Gordius, and he remarks that “this disposition of ganglionic cells in a network (*réseau*) is certainly less rare amongst invertebrates than has been generally supposed, and probably represents the whole nervous system of the lower types.”

For some years past little progress has been made in the discovery of the males of Rotifers beyond those of the species described by Brightwell, Gosse, &c. Dr. Hudson lately contributed an important paper on this subject to the Royal Microscopical Society, which will be found in the *Monthly Microscopical Journal* for February. He was so fortunate as to find the males of *Lacimularia socialis*, *Floccularia campanulata*, and of a new species of *Asplanchna* resembling *A. priodonta*. Like other male Rotifers, these new ones, being destined to a short life devoted to their special sexual business, are not furnished with any digestive apparatus.

In the same journal will be found an interesting paper, by Dr. Royston-Pigott, “On the Invisibility of Minute Refracting Bodies, caused by Excess of Aperture, and upon the Development of Black Aperture Test Boards and Diffraction Rings.” He finds that “the aperture of an objective regulates the appearance or disappearance of the circular black outline of minute refracting spherules, and, consequently, the black band of refracting cylinders.” Too large an aperture leaves minute objects of this description quite indistinguishable, a fact which, taken in connexion with many others, justifies Dr. Carpenter’s protest against excessive apertures made years ago, and confirmed by the preference the great German microscopists have always shown for moderate ones.

* *Microscopical Notes regarding the Fungi present in Opium Blight*. By D. D. Cunningham, M.B., Surgeon H.M.’s Indian Medical Service, Calcutta.

DR. J. J. WOODWARD, United States army, has devoted much trouble to a comparative examination of the blood corpuscles of man and certain other mammals, and his results will be found in the last-named publication. He gives a wholesome warning against the assumption that the microscope can be relied upon in medico-legal investigations to pronounce authoritatively that certain corpuscles are those of man. He finds “that blood from the dog and several other animals would give stains possessing the same properties, and that neither by the microscope nor by any other means yet known can the expert determine that a given stain is composed of human blood, and could not have been derived from any other source.”

Silliman’s Journal for January 7, cited in *Month. Mic. Jour.*, describes an Amoeba discovered by Professor Leidy, which takes up into its body along with its food a quantity of sand, and drags after it a quantity of dirt attached to a papillated, or villous discoid projection. This villous projection will remind the microscopist of the remarkable observations made by Dr. Wallich in 1863, and published in the *Annals of Natural History* for that year. Dr. Wallich supplied the writer with some specimens which are described in the *Intellectual Observer* (vol. iii. p. 430), and it is there remarked, “I may state that my specimens of the *Amoeba villosa* were very uneven in surface, from the multitudes of objects that had been taken in by the gelatinous mass, but were not sufficiently engulged to leave it smooth.” Dr. Wallich came to the conclusion that all the different forms of Amoebae are transitional phases of one and the same organism, of which *A. villosa* is the highest state of development. He first found *A. villosa* in ferruginous pools in Lower Bengal, and it was chiefly in a ferruginous pool at Hampstead that he captured his English specimens. They were plentiful in March, less so in April, and rare in May, after which month they soon disappeared. In the writer’s notes of them it is said, “The voracity of these animals was extraordinary; there seemed no other limit to their appetite than the capacity of their whole bodies to take in and hold the miscellaneous subjects of their choice.” Is this *bulimia* a regular condition of amoebae when they are in the villous state? and was that the cause of Professor Leidy’s specimens ingesting so much sand?

Professor Leidy also found a very interesting *Gromia* in the crevices of city pavements, spreading its living web like a spider to catch its prey.

MEETINGS OF SOCIETIES.

ROYAL MICROSCOPICAL SOCIETY (Wednesday, March 3).

H. C. SORBY, Esq., President in the Chair. Some remarks by Mr. Badcock were read on a species of *Bucephalus*, supposed to be *B. polymorphus* of Von Baer, to which the secretary, H. J. Slack, appended extracts translated from Von Baer, Lacaze-Duthiers, and Giard, on *B. polymorphus* and *Haimeanus*. Mr. Badcock’s specimens of this curious entozoon occurred free swimming in an aquarium tank containing fresh-water mussels. They underwent no change that he could observe in the aquarium, and were found extremely fragile under compression. Specimens he brought to the Society did not survive for sufficient examination. These creatures should be looked for not only free swimming, but in their thread-like sporocysts, which seem often found in the glandular organs of the fresh-water mussel, the cockle, oyster, &c., and in the garfish (*Belone vulgaris*).

Dr. Pigott, F.R.S., communicated a valuable paper, recommending testing high-power objectives by viewing diminished images formed by an inverted objective placed under the stage. If, for example, mercury globules are scattered on black velvet, and illuminated by sunlight thrown upon

them by a Reade prism, the light image formed on the globule and diminished by the inverted objective can be viewed, instead of an object on the stage, by the glass to be tested. In like manner a diminished image of a thermometer scale, or of artificial double stars formed by minute holes in blackened foil with a strong light behind them, may be employed. Dr. Pigott further described the beautiful chromatic rings and other patterns seen in sunlit mercury globules, the exact character and curves of which show the state of the corrections and errors in centering. He also explained, and illustrated by drawings, the curious and unexpected false images—*eidola* as he terms them—produced when diminished images of wire-gauze and other objects are viewed with different focussings and variations of adjustment.

Mr. Wenham described and exhibited specimens of a new mode of mounting such objects as butterfly scales. He cuts a piece of glass, such as a portion of an ordinary slide, right through at an angle of about 30° to 35°, sloping from right to left. The object is then placed on the under side of the sharp knife-edge which is formed, close to the top. The two pieces of glass are brought together and cemented on a glass slide. The light is thrown up from under the stage in the usual way. No balsam or other cement must be allowed to run between the cut portions, and the angle at which the cut is made must not be too near that of total reflexion.

It was announced that at the next meeting, April 7, the President would read a paper on the application of the micro-spectroscope, and exhibit some novel apparatus.

LINNEAN SOCIETY (Thursday, March 4).

DR. G. J. ALLMAN, President, in the Chair. In accordance with the recent custom of the Society, which devotes alternate meetings to the discussion of zoological and of botanical subjects, the present was a botanical evening, and was occupied with the reading of several papers, chiefly of a technical character. Mr. J. R. Jackson had one of more general interest on the plants in which ants make their homes, which was illustrated by dried specimens of two of the most remarkable, *Myrmecodia* and *Hydnophytum*.

Professor Thiselton Dyer read a brief note on the structure of the so-called "membrana nuclei" in the seeds of Cycads. Heinzel had described this as a cellular structure, the cells of which had thick walls penetrated by ramifying tubes. There is reason, however, for believing that the membrane only represents the wall of a single cell, and is, in fact, probably the greatly enlarged primary embryo-sac. What Heinzel had taken for tubes seemed really to be solid. They are arranged all over the membrane after the fashion of what carpet-manufacturers call "moss-pattern." They are possibly the *débris* of the thickened walls of the cells of the nucleus which had been destroyed by the enlargement of the primary embryo-sac. In the discussion which ensued a remarkable diversity of opinion was displayed among the microscopists present, as to whether the reagent magenta exhibits the largest amount of its characteristic reaction on the cellulose wall of the cell, or on its protoplasmic cell-contents.

Professor Dickson exhibited and described a series of microscopic slides illustrating the mode of development of the embryo of *Tropaeolum speciosum*.

ROYAL SOCIETY (Thursday, March 4).

THE following papers were read:—"On the Tides of the Arctic Sea. Part VI.," "Tides of Port Kennedy in Bellot Strait," by the Rev. S. Haughton; "On the Determination at Sea of the Specific Gravity of Sea-Water," by J. Y. Buchanan; "Note on the Value of a certain Definite Integral," by I. Todhunter.

SOCIETY OF ANTIQUARIES (Thursday, March 4).

MR. C. D. E. FORTNUM, exhibited a wax medallion containing a portrait of Michel Angelo, executed by Leone Aretino, and a bronze medal struck in his honour, the portrait on which was evidently copied from the former. The obverse of the medal represented a blind man, with features resembling those of the great artist, led by a dog. The meaning of this group is very obscure. Several explanations were offered by members present, but none seemed to be satisfactory.

Mr. Edwin Freshfield, read a most interesting paper on the Christian Remains at Constantinople, which he has examined with great care. Fourteen Byzantine churches still remain, most of them being used as mosques, and only one for Christian worship. The Church of St. Irene has been converted by the Turks into a small-arms factory. It is probable that some churches were completely destroyed in consequence of their being so distinctly cruciform as to unfit them for Mohammedan worship. In the gallery of St. Sophia a stone has been recently discovered inscribed with the name of Henry Dandolo, the Doge of Venice, who was present at the taking of Constantinople by the Latins, and died there in 1205. It is known that he was buried in the church, but Mr. Freshfield was unable to determine whether this stone marks his place of interment. The fact of the stone being in the gallery renders it improbable.

A number of plans and drawings of most of the buildings in the city, with photographs of both the exterior and interior of St. Sophia and other mosques, were exhibited.

PHILOLOGICAL SOCIETY (Friday, March 5).

REV. R. MORRIS, LL.D., President, in the Chair. Mr. H. Jefferson and Dr. Sturman were elected members. Mr. Alexander J. Ellis, F.R.S., Vice-President, gave an account of the classification of the existing English dialects which will be adopted in Part V. of his *Early English Pronunciation*. Suggestions towards such a classification had been brought before the Society by Prince Louis Lucien Bonaparte, in June, 1873, and since that time the Prince, Dr. Murray, and Mr. Ellis, assisted by Mr. C. C. Robinson for Yorkshire, Mr. T. Hallam for Derbyshire, Miss G. F. Jackson for Shropshire, and numerous other gentlemen and ladies for various details, had worked upon that foundation, and with great labour and difficulty had built up the following arrangement, which seems to be the best attainable with our present knowledge, and is the most minute and complete yet produced. The names are purely geographical (even English and Scotch must be looked upon as local, and not historical terms), and the time considered is 1873-5, without any reference to the past. This arrangement allows of any historical maps being laid over that which will accompany the present classification without confusion of nomenclature. The phonetic grounds of distinction will be contained in Mr. Ellis's Part V., the grammatical, constructional, and lexical are left to separate treatises, except so far as can be inferred from about ninety comparative examples which Mr. Ellis has collected. The following is a *précis* of the arrangement:—

1. GREAT NORTHERN FAMILY.

A. NORTHERN BRANCH.

I. *North Insular Scotch Dialect*.—1. *Shetland* sub-dialect; *a*. Unst; *b*. Lerwick; *c*. Foula, varieties.—2. *Orkney* subd.; *a*. Fair Isle; *b*. Kirkwall varieties.

II. *Northern Scotch Dialect*.—3. *Caithness* subd. 4. *Moray and Aberdeen* subd., Aberdeen, N. and central Banff, N. Elgin, N.E. Nairn and Cromarty, varieties. 5. *Angus* subd., Kincardine and E. Forfar, var.

III. *Central Scotch Dialect*.—6. *Fife and Lothian* subd., *a*. S. and E. Fife, S. and E. Clackmannan, E. Kinross; *b*. E. Stirling; *c*. Lothian (Linlithgow, Edinburgh, Haddington); *d*. The

Merse; *e*. Tweeddale, var. 7. *Clydesdale* subd., Lanark, Renfrew, Cunningham, Kyle, S. Stirling, S. Dumbarton, S. Bute, S.E. border of Argyll, var. 8. *Highland Border* subd., *a*. S.E. Perth, W. Kinross, N. Clackmannan, N.W. Fife; *b*. N. Stirling, var. 9. *Galloway* subd., *a*. Carrick; *b*. Wigtown; *c*. Kircudbright; *d*. Nithsdale, var.

IV. *Scotch and English Border Dialect*. *a*. *Southern Scotch Border Group*. 10. *Southern Scotch* subd., *a*. Teviotdale and Upper Reedsdale; *b*. Selkirk; *c*. Annandale and Eskdale, var. *b*. *Northern English Border Group*. 11. *English West Marches* subd., *a*. Lower Eskdale, Liddisdale, N.E. Cumberland; *b*. N. Cumberland, var. 12. *English East Marches* subd., *a*. N. and S. Shields and N.E. Durham; *b*. N. and E. Northumberland; *c*. Tynedale; *d*. Newcastle-upon-Tyne, var.

V. *Northern English Dialect*. 13. *Cumberland* subd., *a*. N.W. Cumberland; *b*. Mid Cumberland; *c*. E. Cumberland; *d*. S. Cumberland, var. 14. *Westmorland* subd., *a*. N. Westmorland; *b*. S. Westmorland; *c*. Dentdale, var. 15. *North and Mid Yorkshire* subd., *a*. N.W. Mining Districts; *b*. S. Durham; *c*. N. Mid Yorkshire; *d*. S. Cleveland; *e*. N.E. Strand; *f*. S.E. Yorkshire; *g*. S. Mid Yorkshire; *h*. E. Mid Yorkshire; *i*. W. Mid Yorkshire; *k*. Washburn River district; *l*. Upper Craven; *m*. Mid Craven, var. 16. *North Lancashire* subd., *a*. Lonsdale N. of the Sands; *b*. Lonsdale S. of the Sands, var.

B. NORTH-WESTERN BRANCH.

VI. *North-Western English Dialect*. 17. *South Lancashire* subd., *a*. Leyland hundred; *b*. Blackburn hundred; *c*. West Derby hundred; *d*. Salford hundred; *e*. Huddersfield, Yorkshire, var. 18. *Cheshire* subd. 19. *North Peak of Derbyshire* subd., Chapel-en-le-Frith, Glossop, Combs Valley, var. 20. *Derbyshire* subd., *a*. Mid Derbyshire; *b*. N.E. Derbyshire; *c*. S. Derbyshire, var. 21. *Staffordshire* subd. 22. *Shropshire* subd.; *a*. N. Salop; *b*. N.E. Salop; *c*. Mid and W. Salop; *d*. S. Salop, var.

C. NORTH MIDLAND BRANCH.

VII. *North Midland English Dialect*. 23. *South Yorkshire* subd., *a*. Lower Craven; *b*. Halifax; *c*. Bradford; *d*. Leeds; *e*. Dewsbury; *f*. Rotherham, var.

2. GREAT EASTERN FAMILY.

D. EASTERN BRANCH.

VIII. *North-Eastern English Dialect*.—24. *Lincolnshire* subd., *a*. W. Lincolnshire; *b*. N. Lincolnshire; *c*. Mid Lincolnshire; *d*. S. Lincolnshire, var. 25. *Nottinghamshire* subd., *a*. N. Notts; *b*. Mid Notts; *c*. S. Notts, var. 26. *Leicestershire* subd., *a*. E. Leicestershire; *b*. W. Leicestershire; *c*. Mid Leicestershire; *d*. Rutlandshire, var. 27. *Warwickshire* subd. 28. *North Northamptonshire* subd. 29. *North Bedfordshire* subd.

IX. *Eastern English Dialect*.—30. *Norfolk* subd., *a*. Norfolk; *b*. N. Cambridgeshire; *c*. Huntingdonshire, var. 31. *Suffolk* subd., *a*. Suffolk; *b*. S. Cambridgeshire; *c*. N. Essex, var.

E. CENTRAL BRANCH.

X. *Central and Central Border English Dialect*. *a*. *Central English Group*.—32. *Central* subd., *a*. Middlesex; *b*. Surrey; *c*. N.W. Kent; *d*. S.W. Essex; *e*. Hertfordshire; *f*. Buckinghamshire; *g*. S. Bedfordshire, var. *b*. *Central Border English Group*.—33. *Eastern Border* subd., over most of Essex. 34. *South-Eastern* subd., *a*. Kent; *b*. E. Sussex, var. 35. *Western and Midland Border* subd., *a*. Herefordshire; *b*. Monmouthshire; *c*. Worcestershire; *d*. extreme N. Gloucestershire; *e*. W. Oxfordshire; *f*. extreme S. Warwickshire; *g*. S. Northamptonshire, var. 36. *South-Western Border* subd., *a*. Berkshire; *b*. E. Oxfordshire; *c*. Hampshire; *d*. Isle of Wight; *e*. W. Sussex, var. 37. *Living Cornish* subd., W. Cornwall.

3. GREAT WESTERN FAMILY.

F. SOUTH-WESTERN BRANCH.

XI. *The Avons English Dialect*.—38. *The Severn-Avon* subd., a. Gloucester; b. S.W. Berkshire; c. N. Wiltshire; d. N.E. Somersetshire, var. 39. *The Stour-Avon* subd., a. S.W. Hampshire; b. S. Wiltshire; c. Dorsetshire; d. S.E. corner of Somersetshire; e. Axminster, var.

XII. *Devon English Dialect*.—40. *W. Somersetshire* subd., a. Wellington; b. Exmoor, var. 41. *Devonshire* subd., a. N. Devonshire; b. S. Devonshire; c. E. Cornwall.

G. EXTINCT BRANCH.

XIII. *Forth and Bargo English Dialect*, Wexford co., Ireland.

ROYAL GEOGRAPHICAL SOCIETY (Monday, March 8).

At the usual fortnightly meeting of the above body, Mr. Clements Markham, the Secretary, read an interesting paper on the examination of the southern half of Lake Tanganyika by Lieutenant V. L. Cameron, R.N. He began by stating that Cameron had previously done good work by taking regular astronomical and hypsometrical observations along the trodden route from Bagamoyo to Unyanyembe. Beyond that point his route lay between those of Burton and Stanley respectively, and he was thus enabled to explore the drainage system of the southern part of the basin of the river Malagarazi, the most important eastern tributary of Lake Tanganyika, and a range of mountains along the left bank of the Sindé. Cameron's description of the scenery of the country is most enchanting. On reaching the Malagarazi Cameron came upon the route of Speke in 1853, and it is satisfactory to find that their latitude observations agree within a few seconds. Mr. Markham then gave a brief history of our former knowledge of Lake Tanganyika, from the accounts of Speke, Burton, Livingstone and Stanley, from which it would be seen that the question of an outlet was still one of the greatest uncertainty, all the lake having received examination with the exception of the southern half, along a portion of the south-eastern side of the coast of which Livingstone had journeyed in 1868, but without attempting a detailed survey. Nevertheless, in 1871 Livingstone expressed a decided opinion that the lake had an outlet somewhere. Cameron started from Ujiji on March 13, 1874, to conduct the exploration, having previously fixed the latitude of that place by meridian altitudes as $4^{\circ} 58' 3''$ S., and its longitude by lunars as $30^{\circ} 4' 30''$ E. He also found its height above the sea, as proved by independent methods, to be 2,710 feet. He hired two guides who were well up in the knowledge of the lake, and, having equipped two boats, commenced by coasting along the east side of the lake. Off Kungwe he was informed that the Lukuga river flowed out of the lake, and in this belief he was confirmed by a consideration of the number of streams flowing through salt soils into the lake, which, if diminished by evaporation alone, would be as salt as brine. On April 14 Cameron sighted the southern extremity of the lake, where the islands off shore were numerous and the scenery remarkable for beauty. He furnishes interesting notes on the floating islands and aquatic vegetation, which here obstructs navigation. On the 21st he reached Akalunga, one of the largest villages he had seen in Africa, and the same day he commenced the examination of the western shore of the lake. The hills which environ Lake Tanganyika first began to disappear after rounding Ras Tembwe, and the land here became low. On May 2 the river Lukuga was approached, and the chief informed Cameron that the river flowed from the lake into the Lualaba, and that his people travel for a month by it on their way to Nyangwe to trade. No Arab had ever been down it, which explains their ignorance on the subject. Cameron descended the Lukuga for five miles,

and found it from three to five fathoms deep, a mile and a half wide at its mouth, and from 500 to 600 yards wide lower down. Great pieces of drift wood from twenty-eight to thirty feet long floated down the stream. Half-way to the Lualaba the Lukuga was reported to receive another river called the Lurumbuji. Cameron returned to Ujiji on May 9, after an absence of eighty-eight days, having made a valuable chart on the scale of five miles to an inch, the accuracy of which is corroborated by that of Livingstone, with which it agrees very fairly. Mr. Markham then reviewed the general question of the hydrography of Lake Tanganyika and the nature of the outlet, and concluded by drawing attention to the value of Cameron's botanical collection.

A discussion followed in which Sir Bartle Frere, Mr. F. Galton, the Rev. H. Waller, Colonel Grant and others took part.

FINE ART.

THE NEW BRITISH INSTITUTION.

It is no longer ago than November 7 that we reviewed one of these exhibitions, held at No. 39B Old Bond Street: now another has opened. This consists, as usual, of a miscellany of native and foreign pictures, the latter making the greater show. Why the name of "New British Institution" should be adopted, or retained, may be queried. The number of works is close upon two hundred.

We will attend first to our own artists. Mr. Cave Thomas sends a small work, *The Sower*—Christ represented as sowing seed, according to the words of his own parable. The painter has combined something of a stalwart rustic character with the typical aspect of the Saviour: the time is sunset, and the nimbus burns red, like the waning glow of day. This observable little picture is of a broader and less precise manner of execution than usual with the artist. Mr. Smetham is another exhibitor of lofty subjects treated on a small scale. His *Orpheus* portrays the poet kneeling down on the rocky inlet into Hades, and gazing into the unfathomed depth below, down which his hardly-recovered Eurydice has once again vanished: his lyre lies beside him on the crag. Mr. Smetham has a genuine inventive gift, traceable in the general quality of this picture—which is not, however, carried very far in execution. *The Flight of Apollo*, by the same painter, appears to represent the overthrow of the Grecian god at the advent of Christianity. *Druid Stones* is impressive, better in composition and feeling than in colour. All these three works have more the character of designs in oil-colour, done for the sake and significance of the subjects, than of regular pictures for an exhibition-room. *Baby's Bed-time* is a sketch by Mr. Frith, evidently produced many years ago: it is an indifferent performance, although the action of the mother and infant is neither hackneyed nor ungraceful. *My Lady of Castlewood*, a life-sized head and bust by Mr. J. Walker, displays a good sense for that sort of comeliness which wavers between prettiness and beauty. A little picture by Mr. Stannus, named *By Order of the School Board*, two female babes toddling along a country road, to be taken care of at the school-house while their seniors are being instructed, is amusingly quaint. The contributions of Mr. C. W. Wyllie, *Winter—Urmsereaux*; of Mr. J. H. Sampson, *Return of the Fishing-boat*; and of Mr. Muckley, *Rhododendrons*, very dexterously handled—deserve mention.

Among the foreign pictures, one of the nicest is a minute specimen by J. F. Raffaelli, *Le Bon Fumeur*, a free-and-easy gentleman of the sixteenth century, who will not be balked of smoking his clay pipe in a tapestried chamber, although there is a lady on the sofa hard by. This is equally bright in colour and in touch.

Hushaby Baby, by N. Gysis, is a strong positive piece of work, facile, accurate, and expressive; an American negro dandling his master's baby. The negro is more brown than black, and the baby almost as much brown as white. *The Secret*, by Mr. Hennessy, shows two old-world lovers pacing by twilight in the grounds of an unpretentious country house; all is so hushed and placid that a white rabbit close behind them squats up on its hind-quarters:—a pleasant little work from a skilled hand. Great readiness and spirit, not undeserving the name of brilliancy, mark the painting of the *Shepherdess of the Abruzzi*, by Michetti; the tinting, indeed, is somewhat over bright, and wanting in harmonising tone. *In the Studio* is a good specimen of Fichel: an artist of the seventeenth century seated before his easel, and attentively considering what he has done, and what remains to do. One of the largest paintings in the room is by Professor Verlat. It is named *Gluttonous and Lazy—Temperate and Laborious: Repetition of the picture painted for the Cercle Artistique, Antwerp*. The personages are a porker and a donkey, broadly and strongly sketched off at a rapid rate: we understand that this was intended as a hit at the non-professional dining members of a club of artists and amateurs, as contrasted with the working or professional members. We are not aware whether, after this picture appeared on the club-walls, the amateurs seceded, or the Professor was visited with the cold shoulder. *A Rehearsal*, by A. Robert, exhibits two Dominicans, a man and a boy, practising a chaunt; a slightly ungainly work, of more than average sure-handedness and ability. *Washerwomen Quarrelling and Carlist Priests reading the Esperanza*, are clever bits of Spanish character-painting by Yimenes; not particularly attractive to the eye, but repaying detailed examination: the same may be said for *The Village Lavand*, by J. Leister. *Le Réveil*, by Vander Ouderaa, is a tolerably large and worse than tolerably disagreeable representation of two young gallants and two loose women waking or still sprawling after a debauch: there is not any such excellence in the method as would compensate for the low choice of subject. *In the Wood*, by A. Romako, a forest-glade with glinting afternoon sun, on the skirts of wild mountain scenery, and with a couple of figures in the dim-shadowed foreground, has a share of grace and delicacy approximating to the poetic. Van Luppen, Maris, Willroider, and De Schampheleer, contribute works of the landscape class, of respectable, or more than respectable, merit.

W. M. ROSSETTI.

THE CHAPEL OF THE MEDICI.—OPENING OF THE TOMB OF LORENZO DE MEDICI, GRANDSON OF LORENZO THE MAGNIFICENT.

Florence: March 1, 1875.

It having been observed by the intelligent Custodian of the Chapel of the Medici, Giovanni Scheggi, that the statue of Twilight on the tomb of Lorenzo had moved slightly from its position, he drew the attention of the proper authorities to the circumstance, and it was resolved that the figure should be moved from its place to ascertain the cause. This monument, so well known from its noble group of statues, including *Il Pensoso* and *Dawn* and *Twilight*, has always been called by the Italians that of Lorenzo, Duke of Urbino, and son of Pietro de Medici; but this opinion has been called in question by Hermann Grimm in his excellent *Life of Michelangelo*. For reasons which he assigns, he maintains this monument to be that of Giuliano, Duke of Nemours.

On Wednesday, February 24, the statue of Twilight was raised from the lid of the sarcophagus in presence of the Director of the Museums, the Commendatore Aurelio Gotti, the Chevalier Giorgio Campani, and the members of the Fine Arts Commission. When lifted by means of a powerful screw from its bed, it was seen that it was held in its place by

a marble tenon about a foot square and one and a half inches in depth, fitting into a mortice in the base of the figure, the tenon forming part of the lid of the sarcophagus, and that nearer the lower part, under the legs, there was a rough piece of wood, twelve inches long, four and a half wide, and one inch deep. This was worm-eaten and in an advanced state of decay. Above the tenon a slight iron pin, leaded into its bed, had been added to secure the statue, but was quite inadequate for the purpose. The piece of wood had been introduced to raise the statue at the lower extremity, and this had the effect of slightly throwing back the shoulders. As it is known that Duke Alexander (*Il Moro*), son of Lorenzo, Duke of Urbino, was, after his assassination in 1537, deposited in his father's sarcophagus, it was evident that the statues had been raised to admit of this, and that the piece of wood had not been placed there by Michelangelo, but by the workmen who replaced the statue after the deposit of the body of Alexander. It was next resolved to raise the statue of Dawn and observe whether that was safely fixed in its place. This was done on Saturday the 27th. It was found to be fastened by mortice and tenon in the same way. There was no trace of cement in either, and the gap formed by the piece of wood had not been filled in with cement. The space was full of spiders' web.

The statues being raised, it was resolved to slide off the lid and ascertain the contents of the sarcophagus, and so settle the question whether the monument was that of Lorenzo or Giuliano. Two bodies would be found if it was that of Lorenzo. As I was permitted the privilege of ascending the scaffold, and standing at one end of the sarcophagus, I am able to describe the scene that followed. The lid being slid off, rough boards were seen fitting together, and closing and covering the receptacle. I was struck by seeing a workman at the other end with a crow-bar, and his face almost entirely enveloped in his handkerchief, but I was informed that this was because the opening of another Medicean tomb had nearly proved fatal to the workman. With his face thus bandaged he raised the planks at his end, and I helped by lifting at mine, and so they were removed.

The sight within was strange. Two bodies were distinctly visible. They had fallen flat, but at one end of the sarcophagus lay a skull with a black cap upon it, and the body and arms in what seemed to be a white shirt, whilst close to me was a headless body in a black tunic, the form of which was plain enough, with a white embroidery at its lower extremity. The Professor destined to examine the bodies was summoned, and raised the black tunic. Under it was the skull of Lorenzo, for now there can be no doubt that this monument is that of the Duke of Urbino. The Professor, after gathering a few fragments of the clothing, which came to pieces in his hand, called for the help of the muffled workman, who stooped down and brought out the remains in handfuls. I saw with regret that by this process the bones of the two men would be mixed together, and opportunities of observation lost; so I gathered and tried to put in one place the bones near me. On each side the chest and head of Lorenzo were the legs and feet of Alexander, who apparently was the taller man, unless when he was buried the head of Lorenzo was pushed down under his tunic, where it was found, which is not unlikely. The bones of the legs of Alexander were in white linen hose, if it was linen, and under his head was a white pillow; a stout iron spike projected from the bottom of the marble sarcophagus, apparently put there when Alexander was deposited. The remains of a similar spike were also observed at the other end where the head of Lorenzo should have rested. It is probable that these spikes had something to do with the fastening of the first lid, removed to make way for Alexander. The spike was fastened in its place with mortar, which glistened with a gum probably used in embalming

the father. The skull of Lorenzo is large and well-formed, with fine teeth of which about eight seemed to be absent. He was born in 1492 and died in 1519, aged twenty-seven. The Professor was therefore right in exclaiming, "This is the head of a young man." The other skull was smaller, the forehead lower, the nose must have been aquiline; the hair, some of which remained, black, coarse, and curled (*Il Moro*). The bones thus gathered were arranged on one of the long seats of the chapel; they were a dark brown, black in some places, and looked bituminous; both skulls were dark brown. These were taken by the Professor and duly measured with callipers, and their proportions registered, whilst the bones and fragments of garments were put back into the sarcophagus, it having clearly been proved that the monument by Michelangelo with the statues of the Pensoso, Dawn, and Twilight, is that of Lorenzo, the Duke of Urbino. CHARLES HEATH WILSON.

THE STUDIOS. IV.

OF two pictures now at the point of completion by M. Alma Tadema, the most important is the *Candidate*. Within the court (vestibulum) of the house of a Roman patrician stands the candidate for office. He is robed in the toga chalked, as was the custom for this special occasion, to a point of whiteness conspicuous beyond the natural tone of white wool. He is accompanied by his father and his sister, who bears a costly gift destined to propitiate the powerful patron whom they seek. The three are grouped together on the right hand against the pedestal, on which towers a large statue of Augustus, behind which we see the wall of the house. On the left runs up a broad flight of steps leading to the ostium, or entrance to the house. The great man comes forth, the doors are open yet behind him, and at the top of the steps is revealed the entrance hall thronged by a bowing crowd of parasites. The sunlight falls gleaming in long rays across the pillars of the atrium, suggesting light, and air, and space, affording an outlet to the eye beyond the moving figures. As the great man slowly descends, his librarii, the private secretaries who are sitting at a table on a landing near the bottom of the flight, drop their tablets, and rise, bending down with due obeisance, the young candidate, half eager, half afraid, is thrust forward by his father, the sister lifts her gift. The second picture is of lesser size and moment. M. Tadema gives us a young girl of ancient Rome, lying upon a leopard skin. Her left arm is cast above her head, her hand is toying with a black kitten approaching close to her head. The head is thrown backwards, following the direction of her arm. The play of the expression in her face, the fall and rise of the curves of her body as she turns half over towards us, are full of the lazy amusement of idle play. She is robed in pale green, the fillet in her hair is green, her tawny locks repeat the tone of leopard's skin on which she lies extended, the black girdle loosely knotted about her waist spreads the jet colour of the kitten's coat. Warm greys in wall and pavement relieve the group. Just above her naked feet through the wall breaks out an opening, and shows a bright bit of sculptured vase standing against the fresh green and flowers of a near garden. Both these pictures belong to a class with which M. Tadema has long rendered us familiar. They present us with many features which involve the possession by the artist of special antiquarian and archaeological knowledge; but they do not depend for their interest on the expression of this knowledge, nor is it through the amount of knowledge conveyed in them that their value as works of art consists. Our knowledge of any given period of antiquity is necessarily so imperfect, that it is wholly inadequate to serve the purpose of completely accurate reproduction. As a portion of the history of the past, this knowledge, imperfect as it is, has its own value, but in

a work of art it is precious only accidentally, as being the medium through which the given painter thinks. It is not an integral part either of the artistic thought, or of the artistic form, and in these alone resides the essential value of any work of art. Indeed, one may generally be assured, that whenever attention is clamorously demanded in the first place for points of only relative importance—such, for instance, as that the sackcloth and ashes of Job were painted in Syria, or the necklace and earrings of Cleopatra were copied from ornaments found in a tomb of her day—some lack of proper claims to admiration will be found. This is not, however, the case with M. Tadema's work. His knowledge of and interest in Roman antiquity is never displayed at the expense of his art; it is a source which feeds (as all true knowledge must) the springs of invention, and flows obeying the direction given by the predominant artistic intention. The motive implied in the subject of the *Candidate*, for example, depends for its interest, not on the accidents of classic costume and surroundings, but on the sympathy with which the artist has felt the situation, and rendered the various shades of nervous expectancy in those who compose the little group which awaits the moment of the great man's approach, as contrasted with the calm indifference of him on whom their hopes depend. And next, in the manipulation of the costume and accessories, the dominant intention is not so much "correctly" to delineate them, as to elicit in dealing with them such tones and forms as shall best represent the pictorial idea. In the present picture one of the most striking points is the way in which the full value of the white robe of the Candidate is got, as given against the white pedestal and statue on which it is relieved, and this, of course, M. Tadema would have done just as triumphantly, and the triumph would have been just as complete, had it been of any other cut. In the tone of this white robe lies the keynote of the picture in relation to which every other tint has to be considered. It is rendered with the same apt and admirable technic which is always to be expected from M. Alma Tadema. The same brilliant certainty of skilful and adequate handling, which is noticeable throughout, in the varying red dyes of the great patrician's garments, in the shifting colours seen through the open door, or if we turn to the lesser picture, in the green shades of the garden, in the clinging folds of the young girl's robes, or in the dexterous modelling of her outstretched arm.

Mr. Prinsep's painting of a *Minuet de la Cour* promises to be a thoroughly complete and charming picture. Two couples are standing up dancing. Behind them is a background of lookers on, ladies and beaux, some standing, some sitting beneath walls hung with dim-hued tapestry. Both couples are in the act of making the half turn preceded by, and preceding a low curtsy. In the centre, fully turned towards us, stands a lovely figure in white; she turns her head lightly over her right shoulder towards an older man in blue, in whose hand her fingers rest, and whose back is turned towards us. Over the shoulder of the lady in white, and in the space crossed by the extended arms of herself and her partner, we catch sight of a rose-coloured lady, one of the opposite couple. But the two groups are seen, as we say, in perspective, and thus we get a clear view of the second lady's partner, a young gentleman in canary colour, who stands a little up the picture on the left hand of the lady in white. The skill shown in this arrangement of the two couples results in an impression of delightful waving movement, and of graceful interchange of slightly varied curves, which is thoroughly full of dance sentiment, and gives the special character and charm to the whole picture. The painting of the white gown of the principal figure, the way in which Mr. Prinsep has got the relations of the differing tones and textures of the material, and the trimmings of the petticoat, is sure to command admiration. Altogether this painting will pro-

bably be reckoned one of Mr. Prinsep's most complete and satisfactory performances. The *Minuet de la Cour* is within a very little of being finished; *The Gleaners*, a painting of a totally different class, is full of fine suggestions not yet worked out. Four women bearing their sheaves with them are passing along the edge of a cliff, beyond the dip of which spreads the sea. The moon is in the sky above them, the end of the day's long labour is approaching. The first moves forward bowed beneath her burden; she is followed by another who walks erect, poising her bundle of corn upon her head; two others follow side by side, one wearily tugging at her sheaf as she bears it before her. Here again, as in the *Minuet de la Cour*, the suggestion of the continuous movement of the group is extremely attractive; the figures are all walking together. The tone throughout is rich in suggestions of subdued harmonies; everything is there ready to be wrought out. It will, however, be scarcely possible for Mr. Prinsep, rapidly as he works, to accomplish all that the *Gleaners* would seem to demand in the short space yet before him; more especially as he has much to do to a work of great size—a canvas containing three full-length portraits still unfinished. Amongst other and minor work by him may be specially noticed a little figure in a Normandy cap standing with folded hands before her stool in church—a pleasant exercise in many tints of grey and stone, amongst which just a touch of red breaks out brightly.

E. F. S. PATTISON.

MR. J. BIRNIE PHILIP.

THE decease of this sculptor was briefly announced by us last week. The work by which he is at present best known, and will perhaps be always best remembered and esteemed, is the moiety which he executed of the podium to the Albert Monument in Hyde Park. He portrayed the architects and sculptors, while the painters, poets, and musicians fell to the share of Mr. Armstead. Both sculptors have worked well in this very extensive and arduous undertaking; and many of the figures by Mr. Philip might be selected for individual commendation, whether for natural expression, or for general artistic spiritedness and success. Some critics, indeed, think Mr. Philip the abler worker of the two; but in this opinion we can by no means share. Mr. Armstead has shown such very exceptional capacity, gift, and accomplishment, that to be second to him is no discredit. To our eyes, the difference between the work of Mr. Armstead and Mr. Philip is something like that between a high-strung nervous organisation, and one of the lymphatic type: throughout there is, in the latter, less intuition, less energy, a less varied and less keenly receptive mode of life. Still, we may look with much satisfaction upon the portion of the work done by Mr. Philip; and may truly say that, had he executed in the same style the whole of the podium, unopposed by the perilous rivalry of Mr. Armstead, we should have been justified in showing it to foreigners with no stinted amount of national self-complacency.

W. M. ROSSETTI.

ART SALES.

On the 27th ult. was sold at the Hôtel Drouot a collection of tapestries of the first order. Five tapestries, worked with gold, of the Beauvais manufacture, period Louis XIV., with allegorical figures of Justice, Fortune, the Seasons, &c., in medallions enclosed in wreaths, 17,000 fr.; Aubusson tapestry, attributed to Picon, director of the manufactory under Louis XV., with a number of figures of persons about to embark on the sea, 2,265 fr.; series of twelve Brussels tapestries, by F. Raes, seventeenth century, after designs by Rubens, representing the principal events in the life of Alexander the Great, each piece averaged from 800 to 900 fr. The sale produced 44,590 fr. (1,783*l.* 12*s.*).

THE collection of paintings of the late M. Auguier took place on March 1 and 2. For twenty-five years he had been attached to the Administration of the Louvre, and from his extensive knowledge was a great authority on painting. His pictures sold as follows:—A. Cuyt, *Portrait of a Youth*, 5,200 fr., and of *A Young Girl*, 2,720 fr., both of brilliant colouring; Hubert Van Eyck, attributed to, *The Virgin, Infant Jesus, and St. Anne*, a curious specimen of art in the fourteenth century, 2,050 fr.; J. de Heem, *Flowers and Fruit*, 1,720 fr.; Van der Helst, *Meeting of Savants*, 5,100 fr., and *Dutch Family*, 1,180 fr. (two fine pictures with numerous figures—the first is attributed by many connoisseurs to Lenain, as the style resembles that of his well-known full-length portrait of Cinq Mars, at Versailles); P. de Hooge, *Soldiers Playing Cards*, fine effect of candle-light, described in Smith's catalogue, 9,400 fr.; A. Duan, triptych, *The Annunciation and Adoration of the Shepherds*, 4,000 fr.; Cornelius Huysmans, of Mechlin, *Large Landscape*, 1,400 fr.; Fr. Mieris, full-length *Portrait of the Baronne de Cortenac*, 2,550 fr.; Mieris, *Lot and his Daughters*, 1,200 fr.; A. Ostade, *The Concert*, 2,100 fr.; Porbus, *Portrait of Marie de Médicis*, from the collection of the Duchesse de Berry, 2,850 fr.; Rubens, *Portrait of an Infanta*, of brilliant execution, 1,680 fr.; Ruysdael, *The Castle*, signed, from the Galitzin collection, 7,650 fr.; D. Teniers, *Rustic Interior*, 8,000 fr., and *Reading the Gazette*, 23,000 fr.; Ad. Vander Velde, *Pasturage*, 11,700 fr.; Weinix, *Landscape with Ruins*, 2,500 fr., and *Dog and Game*, 4,000 fr.; Ph. Wouverman, *The Stag Hunt*, 1,020 fr.; Alonso Cano, *Magdalene*, 2,000 fr.; A. del Sarto, *Charity*, a repetition of the painting in the Louvre, with changes in the colours of the draperies, 1,250 fr.; Lorenzo Lotto, *Holy Family*, a graceful composition, 2,250 fr.; Pordenone, *Venetian Family*, 1,000 fr.; Raffaele (so ascribed by Ingres, P. Delaroche, Aug. Scheffer, and others), *Sleep of the Infant Jesus*, 5,000 fr.; Paul Veronese, *Judith and Holofernes*, 900 fr.; Zurbaran, *St. Marina*, 2,000 fr.; Danloux, supposed *Portrait of Mlle. Duthé*, 2,850 fr.; N. Poussin, *Adoration of the Shepherds*, 2,340 fr.; Prudhon, *Venus and Adonis*, one of the most important works of the master, 67,000 fr.; R. Fleury, *Luther in Meditation*, 1,500 fr. The paintings produced 213,215 fr. (8,528*l.* 12*s.*).

LAST week Messrs. Sotheby, Wilkinson and Hodge had a sale of some interest to purchasers of Turner's *Leber Studiorum*. They sold four of the plates, known as "unpublished" plates; and several impressions of these subjects struck off before the sale of the plate. They also sold one or two impressions of the published plates; among them, an example of the *Tenth Plague of Egypt*, which happened to be good. Of the four coppers sold, that of the *Premium Landscape* fetched the highest price, it being knocked down to Huish for 51*l.* The mezzotint engraving of this was executed by William Say. The next highest price obtained for a copper was that realised by *The Stork and Aqueduct* (or *The Heron's Pool*)—the subject Mr. Ruskin has pronounced to be, in some respects, the finest of the series. It was purchased by Huish for 42*l.* All the work upon it is Turner's own—mezzotint as well as drawing and etching. Mr. Dobell purchased the plate of *Sheep Washing* (*Windsor Castle*) for 25*l.* 4*s.* This, like so many others of the simple pastoral subjects, was engraved by Charles Turner. Lastly, *Stonehenge at Daybreak*—drawn, etched, and engraved by J. M. W. Turner—was sold for 10*l.* to Mr. Huish. Had the coppers been sold before all the proofs sold at the time in the room had been struck off, the prices would, of course, have been much higher. The prices fetched by the separate impressions it is not necessary to cite, save that we may mention that an outline etching of the *Premium Landscape* sold for 5*l.* 2*s.* 6*d.*

At the sale on the 6th inst. at Christie's of the collection of Mr. Mariano de Murieta, the water-

colour drawings sold as follows:—Bonnefoy, *An Italian Coast Scene*, 15 gs., and the companion, 9½ gs.; Cooper, *Coast Scene, with Cattle*, 12½ gs.; Absolon, *The Wayfarers*, 10½ gs., and *Agincourt*, 9½ gs.; Whymper, *Near Streatley*, 24 gs.; Hayes, *Off Scarborough*, 28 gs.; Duncan, *The Ballad Singer*, 40 gs.; D. Cox, *Going to Work*, 40 gs., and *Llanberis*, 75 gs.; Copley Fielding, *A Stiff Breeze*, 60 gs., and *Scarboro Castle*, 67 gs.; E. Johnson, *My Model*, 35 gs.; Vicat Cole, *Landscape, Winter*, 90 gs.; Lundgren, *The Domino*, 62 gs.; Bennett, *Bolton Abbey*, 25 gs.; Goodall, *A Wayside Cross in Brittany*, 90 gs.; Skell, *Brittany, Coast Scene*, 84 gs.; Goodwin, *The Convent of Assisi*, 127 gs.; Prout, *The Frauenkirche*, 145 gs.; Sir J. Gilbert, *The Challenge*, 95 gs.; Holland, *Genoa*, 200 gs.; Venice, 102 gs.; Hine, *Durlstone Bay*, 180 gs. The pictures sold:—Noerr, *Meeting of Generals*, 100 gs.; Holland, *Rotterdam*, 98 gs., *The Grand Canal*, 526½ gs.; Nittis, *A River Scene*, 135 gs.; Agrasot, *The Connoisseurs*, 121 gs.; Corot, *Jouville-sur-Marne*, 73 gs.; D. Cox, *Calais Pier*, 295 gs.; Nasmyth, *Landscape and Figures*, 100 gs.; Hunter, *After the Gale*, 150 gs.; Pickersgill, *Arrest of Carrara*, 195 gs.; Boughton, *The Syren*, 141 gs.; De Nittis, *Rotten Row*, 300 gs.; Pettie, *The Doctor's Visit*, 250 gs.; Gisbert, *Faust and Marguerite*, 115 gs.; Mouchot, *Entering a Gondola on the Grand Canal*, 80 gs.

NOTES AND NEWS.

IN the list of deaths we notice that of Mr. R. W. Buss, a painter well-known a few years ago. Among his principal pictures is *Soliciting a Vote*, which was pirated by a large manufacturer and issued as an engraving on a pocket-handkerchief. Others have been engraved, such as *The Musical Bore*, *Time and Tide wait for no Man*, *The First of September*, *Satisfaction*, *The Introduction of Tobacco*, *The Frosty Morning*, &c. In Mr. Cumberland's Collection of British Dramatists there are portraits of the celebrated actors of the day, painted by Mr. Buss. He also executed a series of paintings for Captain Duncombe illustrating the Signs of the Zodiac, and two large pictures for the late Earl of Hardwicke, now in the concert room at Wimpole. He was engaged by Charles Knight, the publisher, whose attention was directed to him by a picture of *Christmas in the Olden Time*, to make a series of drawings illustrative of Chaucer, and we believe that many of the illustrations of Knight's edition of Shakspeare, and *Old London*, are by him also. He illustrated, also, the works of Mrs. Trollope and Captain Marryat. His last engagement of this kind was, we believe, with Mr. Harrison Ainsworth, for his novel of *The Court of James II.* He became well known in the provinces by lectures on "The Beautiful and Picturesque," on "Fresco," and on "Comic Art."

THE church of Notre Dame at Walcourt, in the province of Namur, is being restored. Some fine mural paintings of the fifteenth century have been discovered beneath the whitewash; the most remarkable are a series of life-size figures of saints in the arcading beneath the windows of the choir-ambulatory.

PROFESSOR BRUNN (*Transactions of Munich Academy*, 1875) illustrates the difference between the archaeological and philological methods of interpreting the subjects on ancient works of art, choosing for his purpose (1) a silver cup with design from the myth of Triptolemus in the Vienna Cabinet (*Mon. d. Inst.* iii. 4); and (2) the sarcophagus in Wilton House, with a representation from the same myth (Müller, *Denkmäler* ii. 10, 117.) By the philological method it is of course necessary to identify each and all of the figures in these compositions with persons directly connected in the traditions with the myth of Triptolemus. To meet the demand recourse was had to such out-of-the-way persons as Baubo and Dysaules, the parents of Triptolemus, while Per-

sephone had to be identified with a figure entirely wanting in the dignity elsewhere attaching to her. By the archaeological method, on the other hand, the literary version of the myth is accepted so far as possible consistently with the known conditions of art at the particular period when the work was executed. It is the Roman period here, and the philological goddesses and relations of Triptolemus become representatives of the seasons and the course of the year. Brunn's explanation seems to be particularly happy, and as a vindication of the archaeological method very opportune, inasmuch as its opponents have of late been persistent in their attacks, sometimes descending even to ridicule, as in the memorable passage of Fleckeisen's, *Neue Jahrbücher* (1872, p. 171), where Schubert draws a picture of a young Hyperborean archaeologist arriving at Rome, discovering a fragment of marble in the shape of a lion's claw. To his great joy it is "unedited," and he resolves to fill up this blank in knowledge. For the sake of accuracy the engraving must be made in Rome. There is no doubt about its being a lion's claw and *ex ungue leonem*. But while reconstructing the entire lion on paper he hears of a marble lion's tail in the Museum of St. Petersburg, which, since no other lion claims it, obviously must belong to the same animal, as indeed the style of work would alone prove. The whole lion is then reconstructed, the missing parts being, in the interests of truth, indicated by dotted lines. Then begins criticism proper. Have we here an original work, or only a late copy of some well-known masterpiece? If the former, it must be fathered on some sculptor famous for his animals. If a copy, it must next be shown whether from an original in marble or bronze. In the end he is convinced that both claw and tail are remains of an ancient marble copy of the bronze lion mentioned by Pausanias, x., 18, 2, and so on.

THE sixth (annual) series of *Vorlegeblätter*, by Professor Conze, of Vienna, have come to hand, and, as before noted, consist chiefly of illustrations from the works of the Greek vase painter, Duris, one of those who have been charged as imitators of the early style of vase painting. The object of a collection like this is to put such a charge to its severest test, and to furnish students of archaeology with an exercise for their discrimination. Apart from this, the excellence of the engravings entitles them to commendation for a wider circle of students.

Two fine works of sculpture have recently been executed in Rome by English artists. One is a group by Mr. Charles Summers, representing Hypermetra moved with love and pity for her husband Lynceus; and the other, a marble statue of *The Falconer*, of life size, by Mr. George Simonds. Both works, it is stated, are intended for exhibition at the Royal Academy next May.

THE birthday of Raphael will be celebrated on April 6 by the Royal Raffaello Academy at Urbino, when a eulogistic discourse written for the occasion will be delivered in the morning by the Professor Commendatore Augusto Conti, and in the evening a grand concert given, and the Casa Raffaello and its neighbourhood illuminated.

Two nobly conceived works in Corot's studio, the *Dante*, and *Hagar in the Wilderness*, have long been well known to the loved master's friends and admirers. No offer could tempt him to part from these cherished productions, and it is now found that he has bequeathed them to the Louvre.

THE Commission appointed last year by the French Government to prepare an official catalogue of all the artistic treasures of France (see *ACADEMY*, May 30, 1874), has nearly done its work, it is stated, so far as Paris is concerned. The Commission will visit successively every town in France, and report upon its works of art. The idea of this catalogue originated, it appears, with the late Emile Galichon, a writer to whom many art measures in France have owed their origin.

IN a letter addressed to the Director of Fine Arts, M. de Cumont, the Minister of Public Instruction in France, calls attention to the state of decay into which the tombs of Molière and La Fontaine, in the cemetery of Père la Chaise, have fallen, and proposes, instead of simply repairing them, that monuments shall be erected to these two poets.

AN exhibition of ancient and modern works of art will be held in the old château of Blois, and will open on May 1.

M. JACOTOT has left to the Louvre two portraits of Henry IV. and Marie de Médicis, attributed to Porbus.

THE *Art Universel* of Brussels announces that a magnificent silver cup, Renaissance style, the gift of Albert and Isabella to the Guild of St. George, has been sold by the Society of St. George to the Baron de Rothschild for the sum of 1,000l.

THE Louvre purchased, for a sum of 4,000 francs, five splendid specimens of Persian faience at the recent Séchan sale. The Cluny and Sèvres museums likewise made some valuable acquisitions of the same beautiful ware.

M. PAUL BAUDRY has been promoted to the rank of Commander of the Légion d'Honneur; and M. Harpignies to that of Chevalier of the Order. French artists, it is stated, were unanimous in their suffrages for these two nominations.

The art thieves in Spain are still, it appears, pursuing their particular branch of industry without discovery. Their last achievement is the carrying off a miraculous image of the Virgin from some church in Spain and getting it safe to France, where, according to a statement in the *Chronique*, it has been recognised by M. Haro, and placed by him as a deposit with the bankers MM. André and Marcuard. The figure, which is small, is of gilded and painted wood, and dates from the end of the seventeenth century.

THE stolen St. Anthony of Murillo has been restored to its own special chapel in the cathedral at Seville, where its re-installation was recently commemorated by solemn processions and religious services. The foot and hands of the Saint have escaped mutilation, but the face and some portions of the robe have undoubtedly sustained considerable damage.

THE *Gazzetta di Ferrara* states that the Empress of Russia, who already possesses the so-called *Vierge au Livre*, which ranks as one of Raphael's most precious *chefs-d'œuvre*, has offered a large sum for the picture known as *La Madonna della Rovere*, in the Palazzo Garbarino at San Remo, where she has been spending the winter. It is reported that the owner, Dr. Periano, of Genoa, has declined to part with the picture on account of the special historic interest attaching to it, as Raphael is believed to have painted it expressly for Feltria della Rovere, Duchess of Urbino, who had recommended him while still a youth to the patronage of Piero Soderini, Gonfaloniere of Florence.

THE *Giornale Ufficiale* states that Signor Buzzatti, the fortunate discoverer of the silver basins of Gelimar, King of the Vandals, described in the *ACADEMY* of February 6, carried them last week to Venice to be examined by archaeological experts. Their report was most conclusive, confirming the opinion previously formed of their being pieces of great historic interest, and the smaller basin has also great claims to notice in an artistic point of view. Some other objects referring to the Vandal period were found with the basins. Signor Buzzatti promises to continue his excavations without delay.

THE Society of Artists at Vienna has announced that it will open an exhibition in the present month of Admiral Obermüller's copies of the Polar sketches taken by Julius Payer.

THE German engraver Eduard Mandel is at present devoting all his energies to an engraving of the Sistine Madonna. The splendid drawing that he has made of the picture gives reason to hope that his engraving of it will even rival that of Müller. It is a great undertaking for such an old man, but his strength is as yet undiminished, and it is hoped that he will be able to bring it to a successful end.

HERR DONNDORF, of Dresden, has been entrusted with the execution of the statue of Cornelius, to be erected at Düsseldorf.

OWING to the clearing away of some old houses that entirely hid it in some positions from view, the magnificent old Gothic church of St. Gereon, in Cologne, is now revealed in all its architectural beauty. An enthusiastic writer in the *Kölnische Zeitung* says "that the sight of it will bring delight not only to every connoisseur, but to every heart gifted with a feeling for beauty." It is to be hoped that the view thus gained will not be blocked up again by any modern erections.

THE restoration of the Cathedral of Naumburg, which was begun last autumn, is now almost completed.

A NEW edition of Schnaase's monumental work, *Die Geschichte der Bildenden Künste*, has been prepared by the author with the assistance of Dr. C. Dobbert, of Berlin. It is expected that the venerable author will add to this edition an eighth volume on the Renaissance.

IN the *Portfolio* this month there is a fine etching, by Rajon, of Giorgione's study of a knight in armour in the National Gallery. The brilliancy of the armour, so effective in the painting, is well rendered. The excellence also of some photographs from Greek coins, illustrating Mr. Virtue Tebbs' valuable contribution to our knowledge of this subject, deserves remark. It is very seldom that photographs of such subjects can be gained at once so clear and so soft in outline. Bouguereau is the French painter under consideration in the number, and Mr. Holman Hunt's process is described in Mr. Hamerton's "Technical Notes." "Mr. Hunt feels," we are told, "that there is the greatest possible need for a thorough investigation of the nature of pigments and materials used." This is a matter of chemistry, and it is to be regretted that modern painters do not more often avail themselves of that science for ascertaining the purity of their colours and other materials, and for judging of their probable durability. Such a practice would to a great extent check that evil system of "blind confidence" in the colourman which Mr. Hunt so much laments. The old masters mostly prepared their colours themselves, or had them prepared under their own supervision; but now, when "every painter must be quite at the mercy of his colourman," it is surely necessary to take every precaution against adulteration.

THE *Zeitschrift für Bildende Kunst* opens this month with a long article by Mr. Beavington Atkinson on Sir Edwin Landseer. A portrait of Landseer, engraved by F. W. Bader, stands at the head of the article, but we are not treated to any illustrations from his works. The other articles of the number are—a continuation of Robert Vischer's interesting "Studies in Siena," giving a description of the Capellina del Martirio di S. Ansano, with outline woodcuts of several of Pietro Lorenzetti's paintings that will be new to the art student; an account, to be continued, of the New Opera House in Paris, and a technical criticism of the sixteenth century master, Jacob Seisenegger, court painter to the Emperor Ferdinand I., whose recently discovered portrait of Charles V. was mentioned in the *ACADEMY* some months ago. This portrait has been attributed to Titian or one of his nearest followers for more than a century; its restoration to this once celebrated but long forgotten master will no doubt lead to other paintings by him being identified. The etching in the *Zeitschrift* is not as good as usual this month.

THE STAGE.

La Fille de Roland. Drame en quatre actes en vers. Par le Vicomte Henri de Bornier. (Paris: Dentu, 1875.)

THIS most admirable of recent poems for the theatre comes in confirmation of some people's theory that the place of a work, with comedy or with poetical drama, depends more on its treatment than on its subject. It depends also, we should say, on the date of the story and the spot where the action passes. But these themselves may be held to belong to its "treatment," and certainly it is very true that high comedy and serious or poetical drama may often be founded indiscriminately on a like motive. Certain action, either outward or inward—the conflict of certain emotions—takes place in the ninth century, in the dominions of Charlemagne, and the record of it we call "poetical drama," or even, if need be, tragedy. The same action—the same conflict of emotions—takes place in the nineteenth century, in Wimpole Street, in Manchester Square, in the Rue de Morny, and the record of it we call a comedy.

The theme which M. de Bornier has chosen for his "drame en vers"—*La Fille de Roland*—is practically that on which are founded M. Emile Augier's comedies, *Les Effrontés* and *Ceinture Dorée*. Each work has much of its source of interest in the feelings of a man who, having in early life been surprised into an act criminal or disgraceful, is continually burdened with remorse because of it, and finds his worst punishment not in the common punishment which the Society of his day would award him, but in the lasting shame that parentage like his brings on the child he loves. When M. de Bornier's drama begins, Ganelon has long ago, in a fit of jealousy, betrayed Roland into the hands of the Saracens at Roncevaux. For punishment, he was bound to the back of a wild horse and sent to his strange death in a forest. But, unknown to Charlemagne and all the world, some monks rescued him; and one of them, Radbert, had found his son for him, and had counselled forgetfulness of what was gone by, and amendment for the future. The son, Gérald—now a young man—knows nothing of his father's history, and his father has taken a new name. No one has recognised him, and he hears everywhere Ganelon execrated. To all these people Ganelon is a new Judas.

The niece of Charlemagne—the daughter of Roland—making a pilgrimage to a shrine near Amaury's (or Ganelon's) castle of Montblois, is threatened by a troop of Saracens, and saved from danger by Gérald, the son of her father's betrayer. He is taken with the love of her; she, with the love of him. Nothing comes between them but Ganelon's fear of being recognised. Once and again Gérald establishes his claim, strangely denied by his father. At last, fighting victoriously with a Saracen for the sword Durandal—Roland's sword—his claim must be allowed even by old Ganelon himself. So much honour should have wiped out the dishonour. So all is ready for the marriage. At last, the hour foreseen and dreaded for so many years, comes. Ganelon is recognised and denounced. Borne down

with shame that his son should know him to be the betrayer of Roland, he yet pleads for the son, and Charlemagne and his lords see good cause to forget the young man's parentage, in his deeds of prowess, and Berthe's love for him is unchanged.

But these are the times of chivalry, and Gérald is the soul of honour. It is for himself to decide, and with fine instinct—true, whatever may be said, to the time and the character—has the writer caused him to decide to go away. He will leave Berthe. He will follow his father. Nor is there anything Quixotic in his decision. The Emperor gives him Berthe, and he is bound to refuse her.

"Oui, sire, ce bienfait, cette faveur insigne,
C'est en les refusant que j'en puis être digne !

Sans cela l'on dirait, en citant mon exemple,
Que l'expiation ne fût point assez ample,
Et j'aime mieux briser mon cœur en ce moment
Que d'être un jour témoin de votre étonnement !
Oui, vous-mêmes, vous tous qui plaignez mes souffrances,
Vous qui me consolez dans mes horribles trances,
Peut-être cet élan de vos cœurs généreux
S'arrêterait bientôt à me voir plus heureux !
Mon père s'exilait : nous partirons ensemble ;
Il sied que le destin jusqu'au bout nous rassemble.
—Que mon malheur du moins serve à tous de leçon :
Pour mieux vaincre à jamais l'esprit de trahison,
Songez à vos enfants !

Charlemagne. . . . Barons, princes, inclinez-vous
Devant celui qui part. Il est plus grand que nous !"

That is enough to show, at all events, the purity and elevation of tone by which the work is marked. It is not enough to show the admirable art and ingenuity of the plot and many of the incidents: plot and incidents never relied on as the main source of interest, but used adroitly and finely to aid in developing the characters to reader or spectator. One scene—that in which Charlemagne and Berthe watch at a window the conflict between Gérald and the redoubtable Saracen, who thus far, in conflict with thirty knights, has retained the sword Durandal—recalls a scene in *Ivanhoe*, and something in earlier literature. But almost every scene, whether invented or derived, is so treated that the reader feels it to be in its proper place; and many scenes are models of careful construction and subtle execution.

The execution, but never the conception, flags towards the end. The highest interest is reached in the third act. There is not matter enough with which to fill a fourth. The *dénouement* halts, and is waited for. In the earlier acts there is more power, more play of various motive, more subtlety in the fashioning of sayings which suggest this to one, and this to another—carry hope here and fear there, among the persons of the drama—so that the interest is at every moment keenly alive. For what is done most strongly is the character of Ganelon, and his changing emotions, as over and over again recognition seems certain, and is once more delayed. His remorse is constant, but is not suffered to be monotonous, and much of genuine art was needed to avoid monotony. Gérald is a simpler character, firm in execution, as in conception high and true. Berthe is simplest of all, and as true as any. No modern *ingénue*

this, but a character formed by the manners and training of that time: silent, constant, tranquilly heroic. And Radbert the monk, and Charlemagne, in his old age—these two are firmly and sharply outlined.

And lastly, the piece is written in full and sonorous verse, and abounds in picturesque details, and in local colour, used rightly enough with the dramatist's freedom, for it is not the imaginative writer's business to do the work of the antiquary, but to put life into bones which would be dry for ever without his imaginative power. And as a detail of exquisite workmanship—a song to be sung—we will quote, last, certain verses which tell their own story, and should send the reader to the book that holds them:—

"La France, dans ce siècle, eut deux grandes épées,
Deux glaives, l'un royal et l'autre féodal,
Dont les lames d'un flot divin furent trempées ;
L'une a pour nom Joyeuse, et l'autre Durandal.

Roland eut Durandal, Charlemagne a Joyeuse,
Sœurs jumelles de gloire, héroïnes d'acier,
En qui vivait du fer l'âme mystérieuse,
Que pour son œuvre Dieu voulut s'associer."

And then their deeds are sung:—

"Durandal a conquis l'Espagne ;
Joyeuse a dompté le Lombard ;
Chacune à sa noble compagne
Pouvait dire : Voici ma part !"

"Hélas ! La même fin ne leur est pas donnée ;
Joyeuse est fière et libre après tant de combats,
Et quand Roland périt dans la sombre journée,
Durandal des païens fut captive là-bas !

Elle est captive encore, et la France la pleure ;
Mais le sort différent laisse l'honneur égal.
Et la France, attendant quelque chance meilleure,
Aime du même amour Joyeuse et Durandal."

FREDERICK WEDMORE.

STAGE NOTES.

It is said that a series of French performances are to be given at the Opera Comique Theatre, Strand.

MR. HOLLINGSHEAD's season at the Opera Comique terminated last night. *The Lady of Lyons*, with Mr. and Mrs. Kendal in the principal parts, has been acted during the week. *The Bengal Tiger* has also been performed.

Othello has been acted at the Holborn Amphitheatre, with Mr. Creswick in a principal character.

Round the World in Eighty Days was to be produced on Thursday night, at the Princess's, with one or two performers of note, but with scenery and accessories more likely to engage attention.

Two Orphans—Mr. Oxenford's successful adaptation of the French melodrama—has reached its 150th night at the Olympic Theatre. Mr. Albery's comedy is still announced, but no date has yet been fixed for its production.

A Regular Fir, with Mr. Thomas Thorne in the prominent character, is now played nightly at the Vaudeville, after *Our Boys*. It takes the place of the burlesque.

MIDLE DELAPORTE, the great French actress of the Théâtre Michel, St. Petersburg, took her benefit there on February 15. Midlle Delaporte will in a short time return to France, and will probably join the company of the Gymnase Theatre, which possesses in Midlle Pierson its only actress of first-rate ability.

THE Comédie Française, when it does not take its recruits straight from the lessons of the Con-

servatoire, is apt to take them from the Odéon. Not only did M. Pierre Berton, who is shortly going to the Vaudeville, come from the Odéon, but Mdlle. Bernhardt and Mdlle. Emilie Broisat came from the same theatre. And now the Français takes from the Odéon two actors and two actresses: MM. Baillet and Truffier, and Mmes. Fassy and Blanche Baretta. Mdlle. Alice Lody, the promising *ingénue* at the Gymnase, will take Mdlle. Baretta's place at the Odéon.

THE Théâtre des Variétés has given with great success its *Revue à la Vapeur*, written by Siraudin and his comrades. It is remarkable as affording Mdlle. Berthe Legrand the opportunity of imitating at once the art and the mannerism of Mdmie. Chaumont. Baron and Deschamps also appear in the piece.

THE Gymnase Theatre has begun to give *matinées*, following the example of the Gaieté and one or two other Paris theatres.

At the Palais Royal, the *Boule*, by Meilhac and Halévy, has reached its hundredth night, and the *Maitresse Légitime* at the Odéon has attained the same age. It is still very successful, but is to be withdrawn before long to make way for *Un Drame sous Philippe II.*, by M. Georges Portoriche, in which Mdlle. Rousseil will have an important part.

M. VILLIERS DE L'ISLE ADAM has just written for the Théâtre des Arts (which is about to be enlarged and re-arranged) a four-act drama called *Le Prétendant*. The piece is well spoken of, but difficulties will probably be met with in the distribution of the characters.

At the Théâtre Français the second and third row of seats in the pit are almost entirely devoted to the paid *claque*, who are thus often in the way of paying spectators, and these of the most intelligent kind, for the pit at the Théâtre Français is exceedingly well frequented, by playgoers who know more about the piece and the art than most of the people who sit in the *fautouils*. A movement is on foot for removing the *claque* to the very back of the theatre, and if M. Perrin, the manager, consents to this, it may be the beginning of the humiliation of the paid enthusiasts at many another Parisian theatre.

PARISIAN dramatic criticism is often very frank. Here is an example from Monday's issue of the paper most influential in matters of art. The critic is speaking of an actress at the Théâtre des Familles. He says, "Unfortunately the theatre demands of those who make it their career, certain physical advantages which stingy nature has refused to give this *débütante*. Nature has here lodged, by a great mistake, the mind of an artist in an envelope by no means fit for it. That is a pity."

M. BALLANDE is about to give, at his *matinées*, the translation of a famous Russian tragedy—*Ivan le Terrible*, by the Count Tolstoi. It is said to recall to recollection the *Louis Onze* of Casimir Delavigne.

THE interpretation of *La Fille de Roland*—M. Henri Bornier's poetic drama, reviewed in another column—is now even better, it is stated, than on the night of its first production, a fortnight ago. Barring an appearance and manner a little needlessly Byronic and exaggerated, M. Mounet Sully is generally approved as the hero, while of Mdlle. Bernhardt's performance as Berthe, a most competent critic writes:—"She is much applauded for a certain cry in the third act, but I avow that I don't attach much importance to these momentary effects, which a second-rate actress can compass if she have the right temperament and healthy lungs. What connoisseurs value in the talent of Mdlle. Bernhardt is her marvellous *élégance d'allures*, the charm of her diction, the sense of delicate poetry that is somehow always about her.

The first night, looking at the whole performance as a picture, I said her *rôle* was in the middle distance. Since then, she has brought it well into the foreground."

MUSIC.

CRYSTAL PALACE—BENNETT CONCERT.

THERE are but very few composers of sufficient greatness and versatility of genius to be able to furnish the entire programme of a concert, and at the same time to sustain throughout the interest of the hearers. In making this remark, reference is of course not intended to such large works as oratorios or operas, but to such miscellaneous concerts as those of the Crystal Palace. A Haydn, Mozart, Beethoven, or Schubert concert would be, if its numbers were judiciously selected, not only enduring but enjoyable; to these names might probably be added those of Mendelssohn and Schumann; but who could sit out two hours of Romberg or Hummel, or even (with all respect be it said) of Cherubini? So, too, with living composers. We admire and enjoy the works of Brahms and Raff; but an entire concert of the former would involve severe mental exertion on the part of the audience; while Raff's genius, marked and distinctive as it is, is of too small calibre to sustain the attention throughout a whole evening.

In making these remarks, I do not for a moment intend to cast any reflection on Mr. Manns and the Crystal Palace authorities for giving us last Saturday a concert selected entirely from the works of the late Sterndale Bennett. On the contrary, the idea was a most laudable one, and a well-merited tribute to the memory of one of the most genuine artists whom this country has produced. If the result, from a musical point of view, was scarcely entirely satisfactory, it had certainly one advantage—that it has given an opportunity of a much more extended view of the range of the composer's powers than could have been obtained in any other way.

I have just now said that the musical result was not entirely satisfactory. This is simply equivalent to saying that Bennett was a composer of the second, not of the first, rank. He may be classed with such men as Gade, Reinecke, or Hiller, not with Mendelssohn or Mozart. His style was distinctly founded upon that of Mendelssohn, of which it is at times little more than a reflection. It was impossible not to feel this in the first overture played on Saturday—that to the *Wood-Nymph*. Here not merely were the subjects of the *allegro* of an unmistakably Mendelssohnian type, but the triplet figure for the violins which so largely predominates reminds one forcibly of the first movement of the "Italian" symphony. In his pianoforte and vocal music the resemblance to his model is less marked; but it may safely be said that, but for Mendelssohn, Bennett would never have been what he was.

The great merit of Bennett's music is its exquisite artistic finish. Every note is in its right place, the ideas are always full of grace and elegance, and their treatment shows not merely mastery of technical resources but that true feeling for the beautiful which enables the composer to select the right one of the many things which it was possible to say on his subject. And yet with all this there is something lacking, something which just makes the music with all its beauty fall short of greatness. Its one failing is want of breadth. The details are charming, there is unity of design, too, about the work, but it is the unity of a miniature, not of a large painting, of a sonnet, not of an epic. There is no "grasp" about it; and if it always interests, it seldom warms and never excites.

The selection given on Saturday presented Bennett from three points of view—as a writer for the orchestra, for the piano, and for the voice. In the first of these departments it would have

been well, if practicable, to have given one of his symphonies, but the only one at present available (that in G minor) had been performed too recently at these concerts to render its repetition advisable. The orchestral selection was therefore confined to three overtures—those to the *Wood Nymph*, *Parisina*, and *Paradise and the Peri*. Of these works the first named, composed in 1838, when the writer was twenty-two years of age, is the most reminiscent of Mendelssohn. In grace and charm it is a worthy pendant to the better known overture to the *Naiads*, but of individuality of style there is but little trace. In this respect the overture to *Parisina*, while inferior in the mere beauty of its themes, is its superior. Best of all, however, is the overture to *Paradise and the Peri*, one of Bennett's later works, composed for the Philharmonic Society in 1862. This charming piece furnishes a decisive answer to those who maintain that in his earlier compositions Bennett "had written himself out." It would be more correct to say that he wrote less in the later years of his life simply from want of time. England is no country for composers who wish to live by composing, at least not if, like Bennett, they write for their art, and not for the music-shops. We have here no snug Capellmeisterships, as in Germany, where a musician can live a quiet untroubled life, secure from want, and with plenty of leisure to devote himself to his art. In London, on the contrary, the life of the professor is one continual round of hard work; and if (as has been stated) Bennett was in the habit of giving ten hours' lessons a day, how was it possible for him to compose? Had Beethoven been a fashionable teacher in London, and Principal of the Royal Academy of Music, it is more than doubtful whether we should ever have had the Choral Symphony.

As a writer for the piano, Bennett was represented on Saturday by his Concerto in C minor (No. 3) for piano and orchestra, and his elegant "Rondo Piacevole," Op. 25, for piano alone. His pianoforte music is mostly of high excellence, distinguished by the general features spoken of above, and with considerable invention in the matter of "passage writing." The concerto in C minor, though less frequently heard than that in F minor, is little if at all inferior to it in merit. It is written strictly in the orthodox form which appears to have been first fixed by Mozart, and which modern composers frequently modify—not always with advantage; in its ideas it is very pleasing; and its treatment, both as regards form and the display of the solo instrument, is admirable. It received a most excellent interpretation at the hands of Miss Agnes Zimmermann, a lady whose refined and tasteful playing is always to be heard with genuine pleasure, and than whom there is no more conscientious artist now before the public. The fair pianist was no less successful in her unaccompanied solo.

It would occupy too much space to enter into details of the seven vocal numbers which furnished the remainder of the programme. They comprised songs by Miss Antoinette Sterling and Mr. Vernon Rigby—both of whom are too well known to need more than a word of mention—the trio "The Hawthorn in the Glade," from the *May Queen*, sung by three students of the Royal Academy, Miss Jessie Jones and Messrs. H. Guy and Wadmore; the quartet, "God is a Spirit," from the *Woman of Samaria*, and two four-part songs given by the same vocalists, with the addition of Miss Thekla Fischer. These ladies and gentlemen are, I understand, pupils of Signor Randegger, and, both as regards management of the voice and the finish of their *ensemble* singing, do great credit to their instructor. As a whole the vocal music was less interesting than the instrumental, and it was in these numbers more especially that the want of sustaining interest in the programme was to be felt.

The concert commenced with an "Elegy" for orchestra, written in commemoration of Bennett.

death by one of his most talented pupils, Mr. T. Wingham. This little work is unpretentious in design, but well put together, and introduces with effect a fragment of the "Barcarolle" from the departed composer's Fourth Concerto. It was warmly received by the audience.

To-day Herr Joachim is to appear and perform a new concerto of his own, for the first time in England. EBENEZER PROUT.

THE interest of the last Monday Popular Concert may be said to have been fairly divided between Mdle. Krebs and Herr Joachim. The former chose as her solo Schumann's "Toccata" in C, Op. 7, a work which had not before been heard at these concerts, but which she had played last year at one of her recitals. This very interesting piece contains but few traces of its composer's usual style; it is written chiefly as a brilliant show-piece, though it does not on that account, like too many show-pieces, display poverty of idea; still it is the passage-writing rather than the thought which most impresses. Its difficulty is something enormous—so great, in fact, that we believe Mdle. Krebs is the only pianist who has had the courage to play it in public in this country. Her performance of the Toccata is marvellous for the apparent ease with which it is given, and for the manner in which the meaning of the work is revealed even through the most complex passages. The same thing may be said of Herr Joachim's performance of Bach's "Chaconne," a very old favourite at these concerts, but which no other violinist can play as he does. The lady and gentleman joined in a magnificent rendering of Beethoven's "Kreutzer" sonata, which, as some of our readers may remember, was to have been given at a previous concert this season, but was omitted on account of Mdme. Norman-Néruda's indisposition. The concert opened with Haydn's Quartett in G, Op. 17, No. 5, one of nine which the old master wrote in that key, and remarkable for an early example contained in the slow movement of the introduction of recitative in instrumental music. The vocalist was Miss Sophia Löwe, and the conductor Sir Julius Benedict.

AT Mdle. Krebs's second recital at St. James's Hall, on Wednesday afternoon, the programme included Beethoven's Sonata in C (Op. 53), Schumann's "Carnaval," and shorter pieces by Bach, Beethoven, Rubinstein, Chopin, and Krebs. The young lady's playing has been so often praised in these columns that it would be a vain repetition to enlarge upon it here.

MR. GYE has issued his prospectus of the coming season of the Royal Italian Opera, which is to open on the 30th inst. (Easter Tuesday), with a performance of *Guillaume Tell*. The list of artists engaged includes nearly all the familiar names of last season, and five new singers are to make their first appearance in this country. These are Mdle. Zare Thalberg (a daughter of the famous pianist and a grand-daughter of Lablache), Mdle. Proch, Signor de Sanctis, Herr Seideman, and Signor Tamagno. Signori Vianesi and Bevigiani will, as in past years, share the conductor's duties. The list of new works and revivals, of which at least three are intended to be given, comprises Gounod's *Romeo e Julietta* (for the first time for seven years), Rossini's *Semiramide*, Herold's *Pré aux Clercs*, and, last and chief, Wagner's *Lohengrin*, which has been a considerable time in preparation. It will be on this work, should it not remain as in past years merely a promise, that the chief attention of musicians will be fixed. The cast announced includes the names of Mdles. Albani, D'Angeri, Proch, Mons. Maurel, and Signori Nicolini and Baggiolo. The Floral Hall Concerts will also be given, as in previous seasons.

MENDELSSOHN'S *Hymn of Praise* and Rossini's *Stabat Mater* were given at the Royal Albert Hall

on Tuesday. A series of performances of Bach's *Passion* is announced to be given at this hall during Passion week, under the direction of Mr. Barnby.

MR. EBENEZER PROUT has resigned the editorship of the *Monthly Musical Record*.

THE election to the Professorship of Music in the University of Cambridge, rendered vacant by the death of Sir Sterndale Bennett, is fixed for Tuesday next. The most prominent candidates for the post are Mr. G. A. Macfarren, Dr. Wylde, and Mr. Joseph Barnby. The position of the first-named gentleman in the musical profession, and his eminence as a composer, would render his election extremely popular beyond the limits of the University; and the Senate would do honour alike to him and to themselves by his appointment.

A NEW opera entitled *Carmen*, the text by MM. Meilhac and Halévy, the music by M. Georges Bizet, was produced at the Opéra Comique, Paris, on the 3rd inst. The *Revue et Gazette Musicale* speaks highly of the music.

CARL RHEINTHALER, a composer, who may be remembered by his oratorio *Jephtha*, which Mr. Hullah brought out many years since at St. Martin's Hall, has written a new opera, *Edda*, which has been given with great success at Bremen.

PROFESSOR BÖHM, of Vienna, a distinguished teacher of the violin, has just celebrated his eightieth birthday. Among the most distinguished of his pupils are to be named Ernst, Hellmesberger, sen., Joachim, and Leopold Auer.

MR. EDMUND VAN DER STRAETEN has discovered in the Archives at Brussels a document which proves that the celebrated Flemish musical theorist of the fifteenth century, John Tinctoris, returned to the Low Countries and became a canon of the Church of Nivelles, where he died in 1511. The town of Nivelles is, as we have already mentioned, about to erect a bronze statue to his memory.

A NEW tenor, Signor Bignardi, has made his first appearance in Glasgow, with Mr. Mapleson's operatic company, as Pollio in *Norma*, and is favourably spoken of by the local papers.

ST. PATRICK'S EVE will be celebrated at the Royal Albert Hall by an Irish Festival Concert, in which Mdme. Lemmens-Sherrington, Mdme. Patey, Mr. Vernon Rigby, and Signor Foli (who will sing in London for the first time this season), will take part. Mr. Levy, the celebrated cornet player, will also appear, and part-songs will be contributed by the Part Song Choir of the Royal Albert Hall Choral Society.

POSTSCRIPT.

MR. J. M. COWPER's edition of the fourteenth century English poetical version of Cardinal Bonaventure's Meditations on the Supper of our Lord, and the Hours of the Passion, will be issued to the members of the Early English Text Society next week, with other books previously announced to form the Society's first issue this year.

THE Alexandra College, Dublin, which was founded in the year 1866, for improving the education of women of the upper and middle classes, has succeeded so well that it is now entering into contracts for the purchase and erection of fresh buildings, the existing ones having proved insufficient for the increasing number of students. Fifteen is the downward limit of age for admission to the College.

WITH reference to the omission of Dr. Brandis's *Forest Flora* from the list of works consulted by Dr. M. C. Cooke in the preparation of his Report on the Gums and Resins of India, we understand that the simple explanation is that Dr. Cooke, in spite of every effort, could not procure a copy of

Dr. Brandis's work in time for his Report. He did not get a copy of it until after his Report had been six weeks at press.

THE "Emperor Bell," which has been cast at the Frankenthal foundry near Worms, is to be transported to Cologne as soon as the river navigation is fully established after the breaking up of the ice. The metal of which this colossal bell is cast weighed 50,000 lb., and was obtained from the cannon taken in the French war, and among the twenty-two pieces of ordnance which have been incorporated into it there were seven whose dates proved them to have been constructed in the time of Louis XIV. It is, therefore, not improbable that they may have been used to devastate the very same part of the old Palatinate in which the metal has been cast into its present form. The bell, which is twelve feet in height and ample enough to shelter fifteen men under its dome, is adorned with a bust of St. Peter, the patron of church-bells, and bears under the Imperial eagle a Latin distich and a German verse, setting forth its purpose of calling together the people to attend the services of the church. The dedicatory inscription, which is graven round the margin, proclaims that "William, the high and mighty German Emperor, and King of Prussia, in humble gratitude for the help granted him from above in bringing to happy conclusion his late war with France, has caused the enemy's guns which were taken by the German troops to be melted down into a bell for the Cathedral Church at Cologne." In accordance with this pious intention, the inscription goes on to announce that the committee appointed to superintend the completion of the Cathedral have caused the bell to be hung in the southern tower of the church, with the concurrence and during the rule of the Roman Pontiff Pius IX., and Paul Melchers, archbishop of the see.

MR. E. H. PICKERSGILL is to lecture this evening at the Artisans' Institute, Castle Street, St. Martin's Lane, on "Hamlet: its Poetry and its Philosophy."

SATURDAY, MARCH 27, 1875.

No. 151, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscripts.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

All in All: Poems and Sonnets. By Philip Bourke Marston. (London: Chatto & Windus, 1875.)

Two or three years ago Mr. Philip Marston published his volume named *Song-tide*; which, without producing any very general impression, was nevertheless quite sufficient, in the mind of judges here and there, to mark him out as truly a poet. The volume which now lies before us is intended as a sequel to the *Song-tide*, it being the author's aim to depict love under various aspects. The earlier book represented love without hope of success; the present one shows that this love has at last obtained a response, but its course has been sundered by the death of the beloved one, and the lover is left with his intense grief and with yearning aspiration. Another volume, to be entitled *A Pilgrimage*, is to close the series. The author's preface sets forth the foregoing points in brief terms, which we have still further shortened. The *Pilgrimage* (it would appear from a sonnet in the present volume) is to dwell more in detail on the character of the lady, and the actual course of the wooing.

Besides its literary or poetic merits, which are of considerable account, two things lend a peculiar interest to this work. In the first place, it is unmistakeably evident that Mr. Marston is writing from actual personal feeling and retrospect; he is no masquerading Damon who languishes for an improvised Delia, but a man who has lived that which he writes about—to whom these agitating, terrible, and mournful experiences have been the very realities of successive years. Secondly, Mr. Marston has had the misfortune of being blind from a very early period of childhood; a fact which is indicated here and there in the course of his poems, although these are for the most part written as if no such bereavement affected the author. This fact enhances in an extreme degree the sorrowfulness of the story shadowed forth in the poems, and the consequent sympathy of the reader both for the writer's depth of emotion, and for the fortitude which he nevertheless does not permit to be altogether quelled in his mind and spirit. Besides, it causes many passages, which under other physical conditions might excite no particular attention, to become a singular and interesting study—showing, as they do, how far perceptions can be appropriated by a reflex mental act, or how far one sense can supple-

ment another, or the mind compensate for the deficient sense.

"Oh thou vain comforter! do men bereft
Of sight and all the glory of the day,
In their first blindness, turn to what is left?
Nay, rather, the birds' songs through flowery May
They hate; divining from that rapturous mirth
How lovely the precluded sights of earth."

The above is one of the passages from which the poet's privation might be surmised; and a touching one it is. Here follows another:—

"God knows I had no hope before she came,
And found me in the darkness, where alone
I sat e'en then, and brooded o'er things flown.
She touched my hand, she called me by my name,
She broke my darkness up, and smote with flame
The heights and depths of life."

In circumstances which would shake the strongest, the intellectual courage of our author is remarkable. This volume is highly noteworthy among those poems, increasingly numerous in our time, in which frank and unterrified utterance is advisedly given to total uncertainty—or, as it is commonly termed, "scepticism"—regarding the problems of the moral governance of the world, and the immortality of the human spirit. Darkness around him, darkness below and above, is the element within which this poet moves. He would fain find a meaning in the reiterated rigours of Fate, but he knows not whether he may discern it or not: he longs for ultimate spiritual reunion with the beloved and lost one, but he does not permit his cravings to stand to him in the place of convictions; he neither anticipates this blissful solution of the mystery, nor believes in it, nor even ventures to hope it. At the same time, not only do his desires point to immortality as the goal, but his reason allows him to entertain it as a possibility—a faint and arcane possibility, dimmer than the first dimness of dawn half surmised through the blackness of night, and half discredited, on the uttermost horizon. Whatever comes, he will be sovereign within his own mind: tremors shall not wholly overwhelm, nor desire and hope betray him. To her, rest has come; this at least he can believe in: to him also, rest after long sorrow and turmoil is the prospect. To find rest swallowed up in conscious felicity is remote from his expectation, yet not alien from the range of his ideas. In all these respects, the book is an eminently sincere one, and as high-minded as sincere. It may indeed be reasonably compared, in origin and scope, with the *Canzoniere* of Petrarch; and, whatever superiority may be awarded to the Italian poet as regards exquisiteness of artistic development, the Englishman may assuredly claim the more absolute tribute of sympathy. He occupies the loftier seat in the high places of sorrow. His lot has from the first been far the mournfuller one; his grief the deeper and the more unchequered; and his hope, instead of being a confident flame, glimmers more pale and fitful than a glow-worm's lamp. The extent to which doubt pervades much of the best English poetry of our time is in fact very remarkable. It is what might be called scientific doubt, as being the analogue, in poetic minds, of the unfathomed questionings to which investigation and reasoning have led our men of

science. In the poets it takes the form of hopelessness—something beyond sad-thoughted uncertainty, and short of despair: there is some protest in it, and more of acquiescent resolute endurance. This frame of mind necessarily excludes some of the most manifestly poetical elements pertaining to elegiac verse: yet such is the virtue of sincerity and earnestness, and of a reliance upon the actual truth as the individual perceives and realises it, that there still remains much which can be treated with poetic depth and variety, and, as in the writings of our author, with an unfailingly elevated tone.

All in All consists of numerous sonnets, preceded and followed by a moderate number of poems in diversified structural forms. Of these poems the finest is perhaps the one entitled "A Dream:" the stanzas headed "After," likewise, are very graceful in lyrical impulse, as well as pathetic in meaning. The final poem, "To Cicely Narney Marston, a Brother's Tribute," though not among the completest in execution, can be perused with unfeigned pleasure by others besides the sister whose lifelong tenderness is here so warmly acknowledged: this is the only composition which deviates from the main theme of the volume. As a rule, the best work is to be found in the sonnets. Of the depth of feeling in these, and indeed throughout the whole book, it were superfluous to say anything more: but the feeling is not only deep, it is strenuous and high-strung, and the author evinces his poetic vocation by co-ordinating emotion with thought. He can vary the *presentment* of his grief, and even make it ornate on occasion, without losing the true key-note of a personal and unrelieved sorrow. A considerable number of the sonnets take the form of abstract embodiment, in which Love is the dominant figure; Love being considered not exclusively as the amorous passion, but partly in that largest sense in which, to quote the Christian or theological expression, "God is Love." Not that Mr. Marston ever speaks definitely as a theologian, but with a concrete sense of the highest in human experience, and in the realm of the supersensuous. He even adopts now and again certain watchwords or symbols of Christian faith, and re-applies them with his own meaning: as when, in the sonnet entitled "Saving Love," he puts into the mouth of Love the words:—

"I am the Resurrection and the Life;
I am the Love whereby redeemed thou art."

The sonnets of this personating class bear of course a certain resemblance, in general conception and treatment, to some of the most characteristic poems of Dante and other Italian poets, and (in contemporary work) of Mr. D. G. Rossetti. We quote an impressive specimen of this kind; adding to it another sonnet of a different type:—

"Love's Quest."

"Love walks with weary feet the upward way,
Love without joy, and led by Suffering.
Love's unknissed lips have now no song to sing;
Love's eyes are blind, and cannot see the day;
Love walks in utter darkness. And I say,
'O Love, 'tis summer,' or, 'Behold the spring,'
Or 'Love, 'tis autumn, and leaves withering,'
And 'Now it is the winter, bleak and grey.'"

And still Love heedeth not. 'O Love,' I cry,
'Wilt thou not rest? The path is over-steep.'
Love answers not, but passeth all things by,
Nor will he stay for those who laugh or weep.
I follow Love, who follows Grief: but lo,
Where the way ends not Love himself can know."

"Not Thou but I.

"It must have been for one of us, my own,
To drink this cup, and eat this bitter bread.
Had not my tears upon thy face been shed,
Thy tears had dropped on mine. If I alone
Did not walk now, thy spirit would have known
My loneliness; and, did my feet not tread
This weary path and steep, thy feet had bled
For mine, and thy mouth had for mine made moan.
And so it comforts me, yea not in vain,
To think of thy eternity of sleep,
To know thine eyes are tearless though mine
weep:
And, when this cup's last bitterness I drain,
One thought shall still its primal sweetness keep—
Thou hadst the peace, and I the undying pain."

The lyrical poem already referred to may also find a place here:—

"After.

"A little time for laughter,
A little time to sing,
A little time to kiss and cling,
And no more kissing after.

A little while for scheming
Love's unperfected schemes;
A little time for golden dreams;
Then no more any dreaming.

A little while 'twas given
To me to have thy love:
Now, like a ghost, alone I move
About a ruined heaven.

A little time for speaking
Things sweet to say and hear;
A time to seek, and find thee near;
Then no more any seeking.

A little time for saying
Words the heart breaks to say;
A short sharp time wherein to pray;
Then no more need for praying.

But long long years to weep in,
And comprehend the whole
Great grief that desolates my soul,—
And eternity to sleep in."

We shall conclude by specifying some of the technical points which may be regarded as defective; without intending, however, to dogmatise upon matters that are open to difference of opinion, nor to derogate from the general executive merit of Mr. Marston, which keeps pace worthily with his subject-matter. There is some excess of semi-archaic diction, as in the word "doth," and similar forms of the verbs; and in the frequent use of "lo," or of "yea verily," &c., or of an unbending expression when a lighter one would serve fully as well; for instance, in the sonnet named "Spring's Return," the phrase, "And I made answer, saying thus." In the poem written in the heroic metre, "De Profundis," we find a lavish introduction of biblical language, after Mr. Swinburne's pattern; also in the sonnet "Wasted Spring," some lines, without being biblical in phrase, are obviously Swinburnian. Here and there, verses occur which are not compatible with the metre; as, in the sonnet, "Prelude IV.," the alexandrine—

"Think not upon its dark unalterable course;"

or, in "Prelude V."—

"Give to the winds again what the winds have given,
Give I these songs to thee, my life and my heaven."

In the lyrical poems, we observe over-much running of one stanza into another; a pecu-

liarity which may even be made charming when any special choiceness in the variation of the pauses is observed, but which, under other conditions, should be but sparingly indulged in. "Multitude" and "solitude" (p. 46) are not true rhymes, though we know that the authority of Shelley and others may be pleaded in cases of this sort; nor yet "beach" and "besiege" (p. 85): possibly "besiege" is here a misprint for "beseech," which would seem not less admissible as regards meaning. In English poetry it is somewhat hard to blame as excessive the very free use of monosyllabic words, the language making this all but a necessity. Still, our best masters of style do what they can to keep it in bounds, more especially in that gem-like form of verse the sonnet. Their example might be commended to Mr. Marston, and particularly so as regards the terminal words of lines. In one sonnet, "Unseen Worship," we observe that all the terminal words are monosyllables; and probably this is not the sole example to the same effect. The reader may also refer to the sonnet which we have quoted, "Not Thou but I."

The following are presumably mere misprints:—P. 31, "invisible godhead," for "in visible godhead;" 45, "in her maiden's sight," for "in her maidens' sight;" 94, "all thou hast lain upon me," for "all thou hast laid upon me." 129, the line

"And memorable sorrow makes love memorable,"

is not in sonnet-metre, nor does the first "memorable" appear to be exactly the right word. Should it be "present"?

We take leave of Mr. Marston's book with sincere respect for the poetical faculty and attainment which it evidences, and with no small expectation as regards the forthcoming volume of his series, *The Pilgrimage*. When all the conditions under which he has worked are taken into account, it may truly be said that his book is not only an interesting and beautiful one, but hardly to be paralleled anywhere: it far surpasses his own presumable means, or the use which any one else has made of the like means. W. M. ROSSETTI.

Pius IX.: the Story of his Life. By Alfred Owen Legge. (London: Chapman & Hall, 1875.)

MR. LEGGE is, upon the whole, an attaching writer—he is so simple-hearted, so benevolent, so well-meaning, so anxious to be fair if he only knew how, that one has no heart to say much of his numerous peccadilloes. He seems to suppose that Dr. Achilli is a credible and creditable witness about the Inquisition. He seems to imagine that if any rumour at a time fertile of rumours has gained the belief of any respectable writer on a subject where all writers are partisans, the matter of the rumour unless contradicted must pass at once for an historical fact. He contradicts himself a good deal; for instance, after making Bedini the hero of the ubiquitous story about the tyrant who makes the wife's honour the price of the husband's life, he tells us that Bedini was very liberal for a cardinal legate. His English is almost as slovenly as the English of a readable book can possibly be; his only

leading idea seems to be that Pius IX. was wrong whenever he opposed either the constitutional party or the radicals, and that the radicals were wrong whenever they opposed the constitutionalists. But with all these drawbacks he has succeeded by dint of sheer good faith in conveying an intelligible notion of the first four years of a remarkable reign to readers who are capable of disregarding his epithets and his moral remarks and his more or less apocryphal anecdotes, some of which no doubt are true, though neither he nor we know which.

Gregory XVI., a shy, shrewd, and accomplished old bachelor, of simple tastes, who, according to the gossip of the time, which Mr. Legge endorses, had as many old bachelor vices as Sainte-Beuve, had carried out with exceptional rigour the system of repression into which the Papacy, like most other states of Italy, had drifted after the beneficent supremacy of Napoleon had been displaced by the rule of Austria; and the revolution of 1830 had naturally made the real or apparent necessity of repression more urgent. Pius IX., who succeeded him at the immature age of fifty-four, set to work at once with a great deal of hearty good-will, and not a little practical shrewdness of the Haroun-al-Raschid sort, to infuse a new spirit into the government of his States. He had no fixed opinion either for or against organic changes, but he had made up his mind that thenceforward the administration must be got to work in a frank, straightforward, benevolent way. There is really no evidence that he ever promised or intended more; there is no evidence that if he had had time and quiet to work out his experiment fairly, he would have failed in accomplishing this. Nor can it be said that he perceptibly impaired his chance of a fair trial by any misjudgment or imprudence of his own; in fact, he seems to have foreseen how the childish excitement of his subjects was likely to multiply his difficulties; at any rate, he did his best to calm it. But he never had much chance of a fair trial; and after Louis Philippe had run away from an insignificant riot at Paris, he had no chance at all. A minority which maintains its protest under severe and long-continued repression is terribly liable to fixed ideas; and it was a fixed idea with the Roman liberals that no good could be done till clerical government was abolished; and as this was the very last reform to be expected even from a reforming Pope, a peaceable reformation of the Roman state was hardly to be hoped for when all reformers insisted upon this reform before all others. It did not mend matters that the representative of France, a doctrinaire and friend of Guizot, was always urging the Government to make a series of large but definite changes and then to hold its hand. In France such a system was practicable: Louis Philippe on his accession had adopted it, and its effects were soon to be seen; but it was not practicable in a society whose manifold complexities and irregularities had not been effaced by such a catastrophe as the French Revolution. It is really to the credit of the Pope's good sense that he resisted these counsels while he could, and tried to find out gradually and in detail what changes were

practically wanted, instead of granting a cut and dried constitution, extremely unlikely to work, at the expense of scandalising all who thought as he did himself that his spiritual office was much more important than his temporal.

What a ruler of genius might have done is another question, but Pius never undertook to be a ruler of genius, and it is unreasonable to assume that unless he was that he was to do nothing: he did what he could, and for the first eighteen months of his reign he got on better than Joseph II. when he began his reforms. The first effect of the revolution of February was that he had to grant a constitution, which he did with a commendable mixture of frankness and caution, the good effects of which were wholly neutralised, without much blame to anybody, by the fatal disposition of the most moderate constitutionalists to insist on preliminaries which he could not grant. As soon as it appeared that the Chambers and the Parliamentary ministry were not to be invested with the full sovereignty of the ecclesiastical state, Mamiani and Farini and the rest began by their unrestrained impatience and distrust to play into the hands of Mazzini, who with fiendish subtlety or angelic constancy did everything to keep alive the popular excitement, as when the reaction came he expected to reap the harvest of their discontent. But there was a more serious difficulty than even the desire to get rid of clerical government, and that was the desire to get rid of Austria, which began to tell increasingly when the heroism of the people of Milan had relieved their city from the Austrian garrison. Here, again, Pius IX. did his best, and it cannot be said his best was bad. Before the revolution of February he had asserted both his territorial and spiritual independence of Austria, while he had done his best to discourage the chimerical expectation of his becoming the head of a republican federation in Italy. When action of some kind was forced upon him, he applied himself to forming a customs league which might have led to a more intimate union among the princes of Italy, and when it became certain that Austria would have to fight if she meant to recover her ascendancy, he heartily sanctioned the enthusiasm of the volunteers so far as it could be directed to the defence of the Roman State, which was by no means secure in case of Austrian successes. When the army insisted on taking part in the national movement, he first unequivocally expressed his disapproval, and then under pressure from his ministers made a series of concessions, carefully guarded, but still against his better judgment, which were systematically represented as meaning more than they did. Meanwhile he remonstrated paternally with the Emperor of Austria against attempting to reconquer his Italian possessions, and did everything to induce Charles Albert to co-operate with him in forming an Italian league which would reduce to a minimum his personal responsibility for the contingent which he had already placed under Charles Albert's command. That high-minded and generous sovereign was unfortunately incapable of frank co-operation with anybody, and even apart from this his own situation

might have excused him for pressing for a simple alliance and deferring the question of confederation to calmer times. All this time one ministry at Rome succeeded another, the prospects of Charles Albert grew black and those of Radetsky bright, and the Parliament and the mob went on insisting that the Pope had declared war against Austria implicitly, and ought to declare it explicitly; the city had become so unruly that it had been advisable to warn the Jesuits to retire long ago. At last came the short-lived ministry of Rossi. Mr. Legge recounts fully, candidly, significantly, how Rossi was murdered; how for two days the city was given up to the mob, who made themselves accomplices of his murderers: how devoid were the Chambers, his colleagues, his successors, of either will or power to do anything for order or justice; and yet he thinks it was "flagitious perfidy" in Pius IX. to leave Rome as soon as he could. Mr. Legge does not think constitutionalism was made for man; he thinks man was made for constitutionalism. So far, it might seem that Mr. Legge came to curse the Pope, and behold he has blessed him altogether. Underneath his

"tale of sound and fury—

Told by a 'Briton' signifying nothing,"

one discerns the story of an upright, intelligent, benevolent ruler succumbing blamelessly in an impossible task: he had not deceived his subjects; they betrayed him because he refused to allow them to deceive themselves.

At Gaeta the scene changes. The Pope still retained his personal kindliness of feeling and his willingness to do good to individuals, but in politics his calm simple nature seemed to have changed itself with a strange easy ominous completeness. He acted as if he had but one thought, that the humiliation of the Roman clergy would soon be over, and that the rebels would be punished as they deserved. He was not bound, as Mr. Legge supposes, to promise the constitutionalists all they wished on the absurd supposition that then they would be able to save Rome from Mazzini and the French; but he did nothing (perhaps there was nothing to do) to make it easier for his subjects to submit to him than to submit to the invader—did he wish to do anything? Another and a pleasanter transition accomplished itself at Gaeta: for three years the Pope had been the centre of the hopes of the visionaries who looked to the future; for five and twenty years he was to be the centre of the gathering enthusiasm of the visionaries who look to the past. His meditations on the Immaculate Conception are the first stage of the process of which the speeches, which are such an offence to Mr. Gladstone, delivered since the Piedmontese occupation of Rome are the latest. In the eleventh and in the twelfth century the temper and the weapons with which the Papacy fought the Empire, the only mediaeval sovereignty with the pretensions of the modern state, often seemed suicidal to people who wished well to the Church. Pius IX. has done more than seemed possible to revive the temper of the twelfth century among those who still believe.

G. A. SIMCOX.

Account of the Executors of Richard Bishop of London, 1303, and of the Executors of Thomas Bishop of Exeter, 1310. (Camden Society).

THIS volume contains the final accounts drawn up by the executors of two bishops in the fourteenth century, in order to obtain a release from their duties. They consist of inventories of household and landed property, statements of the performance of the legacies, and of the expenses of the executors in discharging their office. The bishops in question are—Richard de Gravesend, who held the see of London from 1280 to 1303; and Thomas de Bitton, or Button, Bishop of Exeter from 1292 to 1307. Neither of them made any great figure in history, and these accounts do not afford much personal information concerning them, being concerned merely with their property.

The landed property of the bishops being the temporalities of their respective sees, was of course taken possession of by the Crown immediately on the bishopric falling vacant; but the stock of cattle and hay and corn already cut, and arrears of rent, were considered as the bishop's personal property, and are therefore accounted for by the executors. On the other hand, crops still standing went with the land, and the executors were obliged to furnish seed corn and fodder for the teams of oxen and horses necessary for working the farms during the vacancy. The list of manors does not tally in either case exactly with that given in the "Valor Ecclesiasticus" of Henry VIII. By the time the latter was compiled, the see of Exeter possessed two more manors than in Bitton's time. Kaergal, which the editor states in the preface is not included in the Valor, will be found mentioned in the printed edition as Gargonle, an evident misprint for Gargoule. The property of the see of London was more subject to change. In both lists the number of manors held by the see is twenty-four, but only eighteen of the names mentioned in Gravesend's account are to be found in the Valor, and one of these, "Sunnebery," is changed to "Sudbury."

The personal property of the two bishops consisted principally of plate, hangings, and clothes. It is curious that in the inventory of Bishop Gravesend's effects there is no mention of furniture except bedding and carpets; and in Bishop Button's list there is little but a couple of bedsteads, a chair or two, and some chests for packing. No doubt the heavier articles of household use, such as tables and benches, belonged to the house, and were not considered as the personal property of the bishop. The cooking utensils and the contents of the buttery were claimed by the cook and butler respectively as their perquisites.

The chapels of both bishops contained a goodly array of plate, vestments, and service books. Those of the Bishop of Exeter are valued at 96*l.* 14*s.* 10*d.*; while the Bishop of London's chapel furniture was worth 134*l.* 18*s.* 8*d.*, the excess being chiefly in plate. The latter possessed a pair of gloves decorated with goldsmith's work and enamel, which were sold for 5*l.*, equal to more than 60*l.* in the present day. Bishop Bitton, on

the other hand, was contented with commoner and more useful articles, for though thirteen pairs are mentioned, they were sold for only 10s. the lot. He had, however, a much better collection of service books than Gravesend, whose chapel seems only to have contained two *portiforia*, a missal, a psalter, and some sheets of vellum containing the offices for the dead, a very small collection for a bishop's chapel, and none of them worth more than a pound. Both these *portiforia* are of the Sarum use, but in Bishop Bitton's inventory the use is not stated. The style of decoration of the vestments is only mentioned in one instance—that of a chasuble, embroidered with the arms of the Kings of France and England. This was, of course, before the Kings of England quartered the lilies of France with their own leopards. Why the arms were united in this case there is no indication. Could this vestment have belonged to the chapel of Prince Louis of France when he came to assume the crown of England at the invitation of the barons? Bishop Gravesend's lack of books in the chapel is atoned for by the collection kept in his wardrobe. Most of them are theological or ecclesiastical, including writings of Jerome, Alexander of Hales, and Eusebius, and books on canon law. Physical science was not entirely neglected, however, for we find in the list a book of Avicenna valued at 100s. and another *Liber Naturalium*, which was given to a poor scholar for the good of the soul of its late owner; but the price of it was only 3s. The most valuable item of the library was a bible in thirteen volumes, worth 10*l.*, which the bishop bequeathed to Stephen de Gravesende, his nephew, rector of Stepney, who succeeded to his uncle's see in 1318. Among Bishop Bitton's chapel furniture is enumerated a fly flap made of cloth of "tars," by no means a common item in an English inventory. It was used by an attendant to keep flies from settling on the altar during the performance of mass. These insect plagues must have been more troublesome in Devonshire than elsewhere in England, for we find that the Bishop possessed a mosquito net, which certainly cannot have been an article in common use in England, as it seldom, if ever, occurs in inventories of furniture.

Among Gravesend's jewels is found an "instrumentum ad purgandum dentes." This is probably a toothpick, not a tooth-brush. It is coupled with a silver seal, and was doubtless itself of silver, and suspended with the seal to a short chain. In later centuries jewelled toothpicks were common enough, worn round the neck or hanging to the girdle.

The funeral expenses of both bishops were heavy, 140*l.* and 270*l.* Much of this expense, however, was for money distributed at the funeral. At Bitton's obsequies more than 16,000 poor persons received one penny each; while the recipients of Gravesend's charity were more than twice as numerous, and many of the mourners were also entertained at a feast, which cost at least 20*l.* Among the funeral baked meats figure swans, fowls, and rabbits; and ginger and other spices form no inconsiderable item in the expenditure. In each case the

tomb was constructed of marble. Bitton's tomb, before the high altar of his cathedral, was opened during the last century, and a chalice, paten, and sapphire ring were discovered in the coffin. Of these a drawing is given in the present volume. Gravesend's tomb in St. Paul's Cathedral, according to Dugdale, was destroyed in the reign of Edward VI.

We have only noticed here a few of the subjects which this volume illustrates, as it would be impossible to do more. Though inventories may not be very amusing reading, they give a great insight into the manners and habits of our forefathers, and help the mind to realise and see their daily life—a thing of great importance in the study of history. The inventories themselves, as far as can be judged without seeing the originals, are accurately printed, and the appendix contains an analysis of the contents of both lists, which considerably facilitates reference.

C. T. MARTIN.

Fair Lusitania. By Catharine Charlotte, Lady Jackson. With Twenty Illustrations from Photographs. (London: R. Bentley & Son, 1874.)

A PRETTIER volume than this we have seldom handled: we could have wished that its contents realised more fully the promise of its fair outside. The author, indeed, is frank enough to tell us that her book is "merely a collection of extracts from a desultory diary, with letters written during a recent visit to Portugal;" but even this candid avowal has not saved us from some disappointment.

Lady Jackson has spent a considerable time in Lisbon, and has also visited Oporto, Cintra, and a few other places of interest. She has seen very much what the ordinary tourist in Portugal is accustomed to see, and her descriptions of scenery and people are pleasant enough. She has some taste for art, but honestly confesses her ignorance of its technicalities. Being unable to reproduce in words the impressions made upon her by such sights as the Church of Santa Maria de Belem and the Cloisters at Batalha, she has done the best thing she could in giving us admirable engravings of their beauties. In fact, we may say that the chief value of her book is that it draws attention in a popular way to the many charms that "Fair Lusitania" possesses, and may thus be the means of inducing lovers of art and antiquities to visit a region which has lately been too much neglected.

For Portugal is but rarely visited nowadays. It has fallen out of repute as a health-resort—fashion as much as anything else seems to govern the choice of sanatoria—and to sportsmen it has never offered many attractions. Yet now and then a salmon may be caught even as far south as the Douro, and in the northern streams the fishing, especially for trout and grayling, is very good. On the plains of Estremadura and Alentejo may be seen sand-grouse and bustards—both great and little—in abundance; quails and woodcocks are well distributed, and in the Gerez and Estrella ranges—districts almost unknown to Englishmen—genuine sport of the highest type is to be had.

There the wolf, the lynx, and the wild-boar have their haunts, and among the rugged Gerez mountains (the grandest scenery in Portugal) the ibex still maintains its existence.

These, however, are matters upon which Lady Jackson is silent; but of sport in one rather dubious form she was an enthusiastic spectator. Nearly a whole chapter of her book is devoted to the description of a bull-fight at which she was present. During the season there are bull-fights at Lisbon every week; but it was Lady Jackson's special good fortune to be there when a famous Spanish *matador* exhibited his skill. The entertainment was sufficiently exciting, though less so than would have been the case in Spain, for in Portugal it is only the fighters, and not the bulls, that run any risk of life:—

"Be not shocked," says Lady Jackson, "at my bull-fighting propensities; for as *l'appétit vient en mangeant*, so, I think, were the *toirada* to be repeated to-morrow, my young companion and I should be found in the Praça de Sant' Anna, in the front row of *cadeiras*. We certainly shall if El Pólo appears there again."

But the artist, the architect, and the antiquary (who will travel most conveniently if united in the person of one individual), may be most sure that their visit to Portugal will not be unprofitable. It is true that in the larger towns many of the churches were ruined by the evil influence of the Jesuits in the seventeenth and eighteenth centuries, but there may still be found—especially in remote districts—many untouched examples of Romanesque and Saracenic architecture. The "flamboyant" style at its best and at its wildest is over-represented, yet it is interesting to view it in connexion with the so-called "plateresque," which is rather a form of house-decoration than a style of architecture. Here and there in out-of-the-way towns the tourist will stumble upon mansions the magnificence of which will surprise him. They were often erected by men, cadets of noble families, or sprung from the lowest ranks, whom the wealth of the Brazils had enriched, and whose pleasure it was to build a palace in the humble town which gave them birth.

Of course no one would quit Portugal without visiting Bragança, rich in associations and antiquities; Guimarães, the birthplace of Afonso Henriquez; the wooded heights of Busaco, and those rival beauties Batalha and Cintra. To the last and best known of these places Lady Jackson went by train, and her experiences of the Larmanjat railway, if amusing in themselves, are not comfortable reading for possible passengers or shareholders. On this line, we are told, the rails are made of wood, which have a tendency to swell in the rainy season and throw the carriages off the line. Yet the same system is pursued on the railway which is being constructed to Torres Vedras—and this in a country where the mineral wealth is vast, and waits only to be developed! English energy and English capital may work wonders in Portugal.

Of Cintra itself Lady Jackson writes in terms of unqualified and excusable rapture. Byron, in one of his letters, says that the scenery "unites in itself all the wildness of the Western Highlands with the

verdure of the south of France," and perhaps this brief description gives a truer idea of its natural features than can be gathered from the better-known stanzas of the poet in *Childe Harold*. But neither Byron nor Beckford can do justice to the extraordinary beauty of the view from the Castello da Peña; it alone is worth a journey to Portugal to look upon. We regret to learn from Lady Jackson's observations that there is great fear lest Cintra should become degraded into a sort of Rosherville: the ill-repute of its railway may, perhaps, for a while avert this sad fate.

Of the state of literature in Portugal Lady Jackson has nothing favourable to say. The popular novelist Camillo Castello Branco seems to unite in himself all the vices of Mrs. Radcliffe and Miss Braddon; and as to poetry, its voice has long ceased to sound in the land of Camoens and Bernardes. Except in Lisbon and Oporto there seems to be an utter stagnation of thought throughout the kingdom.

Lady Jackson, as we have said, writes in a pleasant and natural way, and with the aid of the engraver and binder has succeeded in making a very attractive volume. We cannot add that she has contributed much to our knowledge of the interesting and neglected country which she visited, and her book is, in our opinion, better suited to the drawing-room than to the library.

CHARLES J. ROBINSON.

Debrett's Illustrated Peerage and Titles of Courtesy. Debrett's Illustrated Baronetage with Knightage. Debrett's Illustrated House of Commons and the Judicial Bench. (London: Dean & Son, 1874, 1875.)

The County Families of the United Kingdom. By Edward Walford, M.A. (London: R. Hardwicke.)

Debrett, which is stated to be the oldest work of reference in the world, has now entered upon its seventeenth decade. The *Debrett* of 170 years ago would be a real curiosity, and we should like to be able to compare it with the volumes now before us.

There are now 571 peers and peeresses of the United Kingdom and Ireland, and twenty-eight spiritual peers of England. On the roll of the Lords summoned to Parliament in the reign of King Henry III., 200 names occur, fifty of which are those of the spiritual barons. Between the wars of the Roses and the decapitations under the Tudors, nearly all the ancient nobility perished, and during the reign of Elizabeth the ducal order became extinct or in abeyance, and continued so until revived by James I. in the person of his favourite Villiers, whom he made Duke of Buckingham. It is a fact well known that no male descendant of any one of the twenty-five barons appointed conservators of the public liberties as granted in Magna Charta can now be found among the Lords.

In the third year of King Henry V. there were four dukes and fourteen earls. The dukes, and also two of the earls, were princes of the blood royal. The barons then, as at all times both before and since, greatly outnumbered all the other ranks in the peerage. When Henry VII. summoned

his first Parliament, only twenty-nine temporal peers could be found including the barons. At the Act of Dissolution forty-two temporal peers voted, many of whom were new men, indebted, as Lingard says, "for their honours and estates to the bounty of Henry or of his father."

Sir Henry Spelman, writing about the year 1630, says, "The whole body of the baronage is, since the dissolution, much fallen from their ancient lustre, magnitude, and estimation," while the ancient honours of nobility had been conferred upon "the meanest of the people, on shopkeepers, taverners, tailors, tradesmen, burghers, brewers, and graziers." On the accession of King James I., the honour of knighthood was conferred upon seven hundred persons. Higher honours were also bestowed with so lavish a hand that, as Stow tells us, many murmured at and ridiculed such profusion; and a pasquinade was seen fixed on the door of St. Paul's offering to teach weak memories the art of recollecting the titles of the new nobility.

Twenty years ago it was asserted on good authority that out of the forty-one noblemen who were enriched by the spoils of the abbey, only eight had their representatives in the male line; and Mr. Erdeswick noted that, within the space of a hundred years, three-fourths of the estates in a county passed into the hands of new families. The latter observation made the Marquess of Halifax say that founding a family seemed to him like children's play when they build houses of cards which a shake or puff of wind throws down again.

It is stated in the preface to *Debrett's Peerage* that "at the present time there is more than the customary number of peers who are without heirs, and that at least three peers are uncertain whether they have heirs." The bulk of the work, however, "increases annually, inasmuch as the creations far exceed in number the titles that become extinct."

It is both amusing and instructive to compare Mr. Evelyn Philip Shirley's *Noble and Gentle Men of England* with the volumes before us, especially with Mr. Walford's voluminous work, *The County Families of the United Kingdom*, which is yearly increasing in bulk, one hundred and fifty additional names having been added to the present edition. In Mr. Shirley's comparatively small and modest-looking volume, we find the names of three hundred and thirty-one county families in England now existing who were regularly established in their respective counties, either as knightly or gentle houses, before the dissolution of the monasteries, and "inheriting arms from their ancestors" at that period.

Mr. Walford gives six hundred and eighty-eight names in the county of York alone! In the same county Mr. Shirley gives twenty-seven names only; and although, perhaps, a few names might justly be added to the list—one, to our certain knowledge, should be—the disparity is something startling.

The "Genealogical Volume," supplemental to the *County Families*, which Mr. Walford promises us at no distant date, will serve to winnow the chaff from the grain, and show how many of the twelve or fifteen

thousand persons named in the work are entitled to the addition to their names of the title of *esquire*, so lavishly bestowed, or even to the more humble, but really higher, title of *gentleman*. If the heralds were once more to make their visitations, as in days gone by, probably not more than half the number would be able to make good their right to bear arms, or to show even the four descents required of those aspiring to be considered of gentle birth. A wit, living in the time of King James I., remarked that *knight*s were becoming so thick in the land it would soon be hard to find a *gentleman*. The same observation might be made now, only substituting the title of *esquire* for that of *knight*. Mr. Walford, alluding to the saying of King James I. that he could make a lord but not a *gentleman*, tells us that "the bearing of arms, not of titles, has ever been considered as the distinctive mark of true noblesse." On the other hand, as the old herald, Master John Gwillim, pursuivant of arms, wisely remarks, if those descended from noble ancestors, "honoured for their good services with titles of dignity as badges of their worth, vaunt of their lineage or titular dignity, and want their virtues, they are but like base serving-men, who carry on their sleeves the badge of some noble family, yet are they themselves but ignoble persons."

The next volume of *Debrett* will, we hope, record the termination of the abeyance in the ancient baronies of Montacute (1299), Monthermer Montacute (1357), and Montagu. The late Countess of Loudoun, sister to the fourth and last Marquess of Hastings, claimed to be the senior co-heiress through Richard Neville, the great Earl of Warwick and Salisbury, called "the King Maker," and his granddaughter Margaret Plantagenet, Countess of Salisbury and Warwick, daughter, and eventually heiress, of George Plantagenet, Duke of Clarence, brother to King Edward IV. and King Richard III. The Countess of Salisbury was the last living descendant of the Royal House of Plantagenet, who, when upwards of seventy years of age, was dragged to the scaffold by Henry VIII. for the alleged crime of high treason. She married Sir Richard Pole, K.G. Her eldest son, Henry Pole, Lord Montagu, also beheaded on a pretended charge of treason, left no son, and from Katherine, his eldest daughter, married to Francis Hastings, second Earl of Huntingdon, the late Countess of Loudoun claimed in direct descent. The fourth and youngest son of the Countess of Salisbury was the celebrated Cardinal Pole, the last Catholic Archbishop of Canterbury.

The improper assumption of titles seems to be on the increase, and we cordially unite with the editor of *Debrett* in the desire that such an anomalous state of things should cease to exist, and that some proper tribunal should be established where rival or fictitious claims may be summarily and effectually adjusted. The Codrington baronetcy has long been claimed by two gentlemen. The right of one claimant to the title was acknowledged by the Heralds' College, but in defiance of that decision the title is still borne by both. It is very desirable that the subject should be taken up seriously in Parliament, and that a commission should

be issued to enquire into, and report upon, the present state of the College of Arms, and the best means of making it more effective and its decisions more respected.

The editor of *Debrett* says, "during the past year much labour was entailed upon me in investigating the claims of correspondents who asserted that their names ought to be inserted," and that "in respect to baronetcies, many new claimants came forward with insufficient data, while others based their rank upon the most ridiculous assumptions; e. g.:"—(1) "I have heard from my father, who had heard from his father before him, that at a banquet given at Oxford to Charles II., His Majesty was graciously pleased to confer a baronetcy upon my ancestor, who presided at the entertainment." (2) "My father used to tell me that his grandfather had heard his father say that it was reported in the family that he was a baronet, because his grandfather had been one, but dropped the title when he fell into poverty. I am the direct heir, and, having made a lot of money, have taken up the title."

That "Antiquarians will appreciate the additions that have been made to the historical and traditional notes in the *Baronetage*" we doubt not, but that they will appreciate also the emendations that have been made in the heraldic engravings and emblazons throughout the work, by the authority of the Windsor Herald, must be regarded as more open to question. Certainly, no one with any knowledge of good heraldry will regard the debased specimens of heraldic drawings in the work with anything but contempt, and for the honour of the Heralds' College we hope that the Windsor Herald had but little participation in the production of such wretched caricatures of true heraldry.

The study of heraldry is once more becoming popular, and as good examples of ancient heraldic drawing become more known, the debased style still clung to with such tenacity by seal engravers who "find arms," "heraldic artists" so called, who daub on coach panels, and (we regret to say) the professional heralds themselves, must give place to a more intelligent and artistic way of representing the devices of heraldry. We trust that publishers of heraldic works also will, ere long, see the necessity of giving better illustrations.

Out of many instances which might be named, one will suffice to show the necessity in a work like *Debrett* for the appointment of some competent herald to examine from time to time the shields of arms introduced, and so avoid the ridiculous blunders which, without such supervision, must necessarily occur. In the *House of Commons*, the arms of Earl de Grey, M.P. for Ripon, the son of the Marquess of Ripon, are incorrectly given. His paternal coat of Robinson is shown impaled with the coat of Vyner, the paternal arms of the Marchioness of Ripon. The correct blazon would be the Robinson coat only, with a label, the difference of the heir, or eldest son, during his father's lifetime. When from want of heraldic accuracy in marshalling coats of arms a man is made to marry his grandmother or his mother, as in the case above mentioned, such heraldic displays become

ludicrous. Mr. Boutell tells us that he once "saved a Minister of the Crown from quartering the arms of his own wife upon a sculptured shield in his own mansion," and we have lately saved another man from having something equally preposterous painted on his carriage. In the *House of Commons* the engravings from ancient seals of corporations are interesting, and some among them are fairly well drawn and engraved, but they are spoiled by the absurd twists and scrolls, supposed to be ornaments, by which they are surrounded. The Essay on Heraldry, which is appended to the last-named volume, will, we hope, prove useful, and tend to popularise a science too long neglected, because misunderstood.

By the courtesy of the editor of *Debrett* we are enabled to give some particulars respecting the early editions of the work which may be interesting to our readers. The original editor of *Debrett* was a bookseller of that name in Piccadilly. The character of the work has undergone many changes. A century ago the then editor inserted many personal anecdotes of a character which would not now be tolerated. It was afterwards issued in two small volumes, 16mo, in which the information afforded was more genealogical than it had previously been, and about forty-five years ago the scope of the work was enlarged, and it resembled *Burke* as now issued. In this form it was continued until about twelve years since, when the form was again altered, the specialty being the amplification of details respecting living members of the titled aristocracy, and the exclusion of all substantial reference to deceased persons. The present volumes contain a vast amount of both useful and interesting information, and give evidence of the painstaking care bestowed on their compilation. They are reasonable in price, and less unwieldy in size than other publications of the kind. We think it only just to add that the unfavourable comments which we have felt bound to make on the heraldic illustrations apply with equal force to similar engravings in other more pretentious works of the same class, as also to nearly all modern publications on heraldic subjects.

JOHN HENRY METCALFE.

Chaucer. *The Prioresses Tale, Sire Thopas, The Monkes Tale, The Clerkes Tale, The Squires Tale, from the "Canterbury Tales."* Edited by the Rev. W. W. Skeat, M.A. (Oxford: at the Clarendon Press, 1874.)

THIS is another of the Bowdlerised texts for schools and colleges which the Clarendon Press Delegates are issuing; and the expurgations are made with increasing strictness. In 1873 Shakspeare was allowed to utter "I would to God," and "o' God's name," in his *Richard II.* in the Delegates' Series, but now in 1874, Chaucer's Monk is prohibited from saying "I vow to God"—"I vow [in feyth]" is the proper phrase—and his "by God" is turned into "in feith," or "ful sone," while many characteristic stanzas are left out on account of one word in them that might offend Mrs. Grundy. Even some of the daintily delicate Prioress's words have

been thought too bad for Mrs. G. to hear. Well, Chaucer anyhow is better than Chaucer nobow; and all Chaucer students will be glad that, by this present volume, increased knowledge of the poet they love will be gained by many young folk, whom they wish to share in the enduring pleasure they themselves have got from that master of pathos, humour and fun, who, 600 years after the great Cynewulf's time, arose and showed that England again possessed a poet. After its first working on the spirit of Anglo-Saxon poetry, and producing first the milder Cadmon, secondly the deeper and truer poets the author of *Judith* and Cynewulf, Christianity seems to have deadened the genius of the Anglo-Saxons. Bishop Lupus's impassioned "Sermon on the Sins of his Countrymen, and their Degradation under the Danish Invasions," is the only later piece worthy of mention; and the dull Anglo-Saxon homilies and treatises were succeeded by a set of like Early-English ones, showing for some 300 years after the Conquest no spark of genius, except perchance a few touches in Layamon, and the alliterative *Gawayne and Morte Arthure*; a few Hymns to the Virgin—Mother and Child came always home to the English heart; a few lines in the *Owl and Nightingale*—the nightingale for whom blossoms spring, whom the fair lily welcomes, and the rose with its redness bids sing; a few love poems—the Beautiful Lady whose head is like the sunbeam at noon, whose presence is heaven here; and *The Land of Cockayne*, that airy, happy, chaffy exposure of the life and naughtiness of monks and nuns, which Chaucer himself never beat. When, then, real poetry reappeared in English, it had lost very much of its old Anglo-Saxon quality; its form was changed, and its spirit too. Alliteration had yielded its pride of place to "light ryme," and Piety had become second to Love. Cynewulf had turned into Chaucer. (I pass over William's *Piers Plowman* as in no true sense a "poem," however great a work it is.) The reason of the change was, that by Chaucer's time the upper classes had become English, and spoke English; and their Norman descent made them call for chivalric themes. By Chaucer's day the Crusade passion had faded, but Love was in full bloom. So the most scanty Anglo-Saxon love-touches—"Maiden, eyes' delight" (three words, and no more), with the like—turned into Chaucer's filling almost every early work* he wrote with love. Cynewulf's *Finding of the Cross*, and *Andreas*, became Chaucer's *Legende of Good Women*. Cynewulf's *Seafarer*, with his sad unrest, whom buds of spring called only to sail again over the whale's home, changed to Chaucer's *Pity*, moaning his unrequited love, to his *Mars, Anelida, Troylus*, all echoing the same "care-full cry;" to his spring worship, when gladder times came to him, of the "flowre white and rede," the daisy that typified his love—

... "she that is of alle flouris flour,
Fulfilled of alle virtue and honour."

Granted the same Anglo-Saxon soil, and the like old shrubs in the *Plowman*, &c., yet Norman cross, Italian culture, had changed

* His humorous work was later.

the flowers, and Chaucer blossomed, where Cynewulf had faded and died.

It seems rather hard, to a Chaucer-lover, to have even a school-book of Chaucer go out without some few words to lift the young student into the feeling which one has oneself for the old poet's tender and beautiful Tales; but Mr. Skeat has kept all this down, and referred boys to where they can find it. Let us, then, take Mr. Skeat on his own ground, and examine first some of his new points.

On the dates of the Tales, Mr. Skeat tells us that he looks on the Cook's Tale (notwithstanding its riotous fun) as almost the last part of the *Canterbury Tales* that Chaucer ever wrote; and on the Monk's Tale as probably early. This is to me like saying that Turner's *Burial of Wilkie* is early, and his *Winchelsea* (say) late; or that the *Fornarina* preceded the Peruginesque Virgins of Raffaele. Surely the Monk's Tale goes with the late Ballad of the Visage without Painting, and the Cook's Tale is one with the Miller's and Reeve's. Mr. Skeat next says, that in the Prologue we ought to reject, in the Prioress's description, the last three words "and Prestes thre"—thus leaving the nun no Priest to tell a tale—although I have shown, from the instance of the five priests at St. Mary's Abbey, Winchester, that three might well have accompanied the Prioress on her pilgrimage, the chief Magister being specially *her* priest, while the two Domini were but secondary. Next, Mr. Skeat thinks that, although Chaucer had written hundreds of four-measure lines in couplets, and hundreds of five-measure lines in couplets, at the end of stanzas, yet he had not head enough to write, of himself, five-measure couplets continuously, without Machault showing him how to do it. The step from one to the other is surely simple enough to be within Chaucer's powers. Further, Mr. Skeat lays down the canon—for the first time in print—that "nearly all of Chaucer's tales that are in stanzas are early; and nearly all that are in the usual couplets are late." * Of the two exceptions that one has always felt to this rule, Mr. Skeat allows Sir Thopas, but denies the Monk's Tale (late, I am sure), which has prevented my trusting it. Next, Mr. Skeat's insistence on the necessary pronunciation of the final *e* at the end of a line (where I believe it was generally silent) leads him to say that before the caesura every final *e* must (not may) also be pronounced, so that *sonne* (son) is two syllables in the following line:—

"Eek thou | that art | his sonë | art proud | also."

To my ear the *ë* ruins the run of the line, and I hope to show elsewhere that the theory is a mistaken one. But whether one holds it or not, I regret greatly that this text appears without the central pause-mark in every line which (with few exceptions) all the best manuscripts of Chaucer retain. One last objection: Mr. Skeat has occasionally altered, unnecessarily as I think, his

basis-text, the Ellesmere MS. In such a line as—

Tragedie is to seyn | a certeyn storie,

why does one want a *for*, from the B-type MSS., stuck in between *is* and *to*?

Subject to the above points, in which I differ from Mr. Skeat, I can give most warm and honest praise to the whole book, from cover to cover. And this, not because Mr. Skeat has adopted the arrangement of the Tales settled by Mr. Bradshaw and myself, and based his edition on my Six-Text one for the Chaucer Society—thus bringing out for the first time in a schoolbook the true structure of the *Canterbury Tales*—but because Mr. Skeat has used his own judgment carefully and cautiously on every point he has discussed; because he has followed out every clue that promised further illustration or elucidation of every subject and word; because he has thrown new light on the source of the Squire's Tale, from Marco Polo; has made most happy hits, as in identifying Chaucer's "wikked neste" of the *Monk's Tale* with Sir Oliver Mauny, who betrayed King Pedro of Spain; and because, in every line of text and note, in every word glossed, there is evidence of that scrupulous care and diligence which has won Mr. Skeat the high reputation he holds among the English scholars of America, Germany, and Great Britain. Differ from Mr. Skeat as you will, you must respect his thoroughness, knowledge, and work.

In the present little book Mr. Skeat, in his Introduction—1. Sums up my late finds about Chaucer's life; 2. Gives Mr. Bradshaw's and my arrangement of the Tales, adding the days of the journey; 3. Notes the incompleteness of the Tales, and suggests that *Gamelyn* was to be the basis of the Yeoman's Tale; 4. Discusses the succession of the tales; 5. The form and subject of each of the tales in his volume, with much new matter about the Monk's and Squire's Tales; then deals with 6. Chaucer's grammatical forms; 7. His metre and versification; 8. Gives a metrical analysis of the Squire's Tale, Part I.; 9. States the method of forming his text, to take my print of the best MS. of the A type, Lord Ellesmere's, as his basis, and never alter it without notice, except in trifling details; 10. Gives a list of useful books. Then come, in 127 pages, the Tales named above—Prioress's, Sir Thopas, Monk's, Clerk's, and Squire's—with head-links and Proems of the Man of Law, and Shipman, and the Nun's Priest's Prologue, all most carefully edited. Then eighty-four pages of capital notes, and eighty-three of Glossary, with etymologies to all the words. Lastly, four pages of Index of Proper Names. It is a sound and scholarly book.

F. J. FURNIVALL.

M. HUCHER's edition of what he regards as the earliest version of the Legend of the Holy Grail, *Le Petit Saint Graal*, has just appeared. It is the prose version of the Old French poem printed by M. Francisque Michel and reprinted by Mr. Furnivall, which, though called "Saint Graal" by some, is named "Joseph d'Armathie" by others; inasmuch as it tells Joseph's adventures, his collecting the blood in the dish of the Last Supper, his journey with it to England, &c.

NEW NOVELS.

Out of the World. By Miss Healy. (London: Sampson Low & Co., 1875.)

The Work-a-day World. By Holme Lee. (London: Smith, Elder & Co., 1875.)

John Dorrien. By Julia Kavanagh. (London: Hurst & Blackett, 1875.)

Brigadier Frederic. By MM. Erckmann-Chatrian. (London: Smith, Elder & Co., 1875.)

Her Idol. By Maxwell Hood. (London: Samuel Tinsley, 1875.)

Out of the World is one of those stories of French scenery, French characters, and English plot, which M. Octave Feuillet's ladies find so dull on wet days in the country. English women will be more easily satisfied, and the law-abiding character of the British novel reader will recognise with pleasure many trusted favourites in the incidents of *Out of the World*. Here are the sprained ankle, the *tête-à-tête* in the storm which Virgil first introduced to polite literature, the secret stairs, and the runaway horse, rather a fine specimen of the breed. The use of these stock adventures and old properties, and a certain want of delicacy in the character, or at least the manners of the heroine, Aimée de Marsac, detract from the merit of what is really a readable book. The young lady just named is half American by birth, and as her Republican tone makes it unlikely that she will find a husband in Paris, she is taken to a dreary Pyrenean *château*, to be wooed by Paul, the son of the Legitimist Marquis of the district. Paul and Aimée fall in love with each other, in the process of making a treaty not to let themselves be disposed of by their parents. A wicked younger brother, Albert, and a passionate Basque peasant girl throw obstacles of the usual sort in the path of their affection, which ultimately "comes round, and is all square." The best characters in the book are Paul's sisters, doomed by their father to old maidenhood. Jeanne, who unites a thwarted love of pleasure to an ecstatic devotion, and a genius for the stage, is really an original and admirable character. Mila, the peasant girl, is a skilful compound of Tessa in *Romola*, and Hetty in *Adam Bede*. *Out of the World* is not written with sufficient care to make up for the want of natural delicacy and grace which a story of this kind requires, but it "marches," as political writers say so often about the new French Constitution, and that is the great thing after all.

"The World is too much with us" just now, what with Miss Braddon's *Strange World*, Miss Healy's *Out of the World*, and Holme Lee's *Work-a-day World*. This last tells the whole life and adventures of Winny Hesketh. Winny is a governess, and one of the nicest of that depressing sisterhood, the governesses of fiction. If the new views of woman and her education can but make this *incomprise* class a thing which can only occur in historical novels of a remote period, the reviewers of the future will have reason to bless the name of Miss Cobbe, of Mr. Holloway and of the energetic founders of Girton. Holme Lee writes the story of her girl Stoic, who "makes up her mind not to mind it," somewhat in the style of Mrs.

* The old tempting-looking suggestion that Chaucer wrote both his four-measure poems—"Dethe of Blanche," and "Hous of Fame"—before any of his five-measure ones, has been long exploded.

Gaskell. There are many sketches of disagreeable families and schools, and of schools and families not so disagreeable. On the whole we wish novelists would keep in mind that it is to "make us forget" that kind of life that "God gave the poet his song." Novelists are not poets, but they might remember and apply to their own work this maxim of Mr. Arnold's. The tale is written with care, and without faults of taste; the characters are natural, and "the sentiments are just," as Dr. Johnson says of one of Shakespeare's plays; but only personal regard for the heroine could make any reader plod through the narrative.

When we made John Dorrien's acquaintance, as he sat, a thin, nervous, eager child, by the fireside, our heart sank within us. That little nuisance Paul Dombey seemed to be before us again, in one of his avatars, which are more numerous than those of Indra, or of Vautrin. But John grew up to immense vigour, of mind and body, and justified the saying that genius means great natural powers accidentally directed. He was the son of a widow who made a scanty, the lover of art can hardly say an honest, livelihood by colouring photographs. He went to a French school at St. Ives, and all we hear of him there is that he began to blossom into a poet. But some supposed wealthy Dorriens offered him a place in their house, which dealt in fancy stationery, paid its debts by selling family diamonds, and collected them revolver in hand. These unbusiness-like ways John Dorrien reduced to order, and was going to marry the niece of the head of the house, who is a Mr. Dombey on the verge of insolvency. But a friend, one Oliver Black, corrupts the young lady's mind by whispering soft nothings out of Hegel and Comte, and, aided by a wicked gambling Creole aunt, nearly ruins the tottering firm. Just as things are getting more and more uninteresting, the girl turns out to have been changed at nurse or somewhere. Mr. Dorrien dies, Oliver Black withdraws, the wicked aunt goes to Monaco—too good a fate for her—and John marries the charming changeling. The vicious but vague philosophy of Mr. Black is confronted and confuted by the Truth, in the mouth of an orthodox lady housekeeper, and the most timid mother may safely place John Dorrien in the hands of the most feeble-minded daughter. The only danger is that its perusal might crush a nascent taste for reading in the young.

It is not always very easy to be in sympathy with MM. Erckmann-Chatrian's virtuous Alsatians. We know them too well by this time—their honesty, their industry, their peaceful character, their perfect appreciation of kirsch, sausage, blonde girls, and domestic comfort. It is a sad irony that has placed a nation so admirably fitted to enjoy a quiet life, in the cockpit of Europe. They are born into a vale, as Mrs. Gamp says, and they are greatly to be pitied. But one fails to see what particular good can come of a tale like *Brigadier Frederic*, with its pathetic story of families broken up, and of Prussian barbarities to women, such as we hope were rare, though they are only too probable. No foreigner can pretend to believe that a French invasion of Germany

would have been nearly so lenient. It is to be regretted that the Alsatians are set between the fiery race of France and the stubborn peoples of Germany, and once we have regretted it we are disinclined to be harassed by a series of novelettes on the dismal theme. Some one in Homer observes that men soon have their fill of bitter lamentations. We hope that MM. Erckmann-Chatrian have now had theirs, and that their next story may be more cheerful and original than this painful business of the woes of Brigadier Frederic.

Her Idol has the name of being a novel, but perhaps we ought rather to call it a parable. The usual runaway horse occurs, there are two cricket matches, and an elaborate account of the almost prehistoric diversion of croquet. The plot admits of being told briefly. Margaret Lisle lived at Shanklin, and as a rule disliked curates, but made an exception in favour of Hugh Treherne, a muscular divine of ungoverned passions. Captain Darrel also made love to Margaret Lisle; Hugh died of typhoid fever; Captain Darrel flirted with a Miss Northey whose betrothed shot himself in despair; a friend of Hugh's, failing to succeed him in Miss Lisle's affections, was drowned in a shipwreck, and an elderly clergyman persuaded the heroine that she had made "an idol" of Hugh, and that she had better take to good works.

Now here are all the materials of a novel—love, jealousy, despair, taking to good works, and the rest of it; but somehow the reader feels that a novel has not resulted from the combination. We hope the people of the Isle of Wight, and especially the clergy of Bonchurch, may enjoy being dragged before the public that reads silly stories. Out of the rather limited area of Bonchurch the book can excite no interest.

A. LANG.

An Introduction to the Study of Early English History. By John Pym Yeatman, of Lincoln's Inn, Barrister-at-Law. (London: Longmans & Co., 1874.)

A GREAT part of this work has already encountered the "slander and abuse" of "anonymous scribblers" as an introduction to the author's recently published *History of the Common Law*. Far from being crushed by this treatment, Mr. Yeatman triumphantly informs his critics that in attacking him they were attacking the great Dr. "William" Whitaker, a writer whom Gibbon himself called "ingenious,"—and, we may add, whom everybody but Mr. Yeatman calls "John." Mr. Yeatman has, in fact, since the publication of his former work, made a discovery. He said in his haste—and in the plainest terms—that all English histories were lies, including works of which he boasts that he has not read a line. He now admits one bright exception to this rule in Whitaker's *History of Manchester*, the reason, of course, being that he has found there theories of early British history only less paradoxical than his own. By the light of this "grand work," the true measure of which has been long ago taken, he has recast and elaborated his arguments in a volume which is indeed, though hardly in the sense he means it, beyond criticism.

Its theories are so fantastic and its language so reckless, that to make use of formal arguments in dealing with it would be sheer waste of labour: a few samples of matter and style will be more amusing and equally effective.

Broadly stated, Mr. Yeatman's object is to prove the Celtic origin of the English people, a pet theory of a certain school, but never before so reduced *ad absurdum*. He rejects the Teutonic element altogether, with infinite scorn for the "bastard English" who credit its existence. To use his own words:—

"The truth is that 'Saxon' was a term of reproach, and not the name of any nationality; and though it was applied by contemporaries to some of the natives of this country, it mainly was intended to designate them as *assassins*, people who carried short swords for piratical purposes."

The Angles, on the contrary, were a nationality, but of Celts; for Dr. Whitaker's derivation—An-gael, the Gaul—is "absolutely faultless," and one "which no scholar can doubt." They were, however, Celts and something more. They were "the people who called themselves Llogrians;" and these "English" Llogrians again are plainly to be identified with the Ligurians of North Italy, "the evidence of the name of Liguria" being "simply irresistible, permeating through the whole of England," chiefly, it seems, in the form of "endless Leighs." It results from this, that "English is the tongue of ancient Liguria," a fact of which Mr. Yeatman is as certain as he is that "it was the language of the natives and of their conquerors, the Romans, in the first five centuries after Christ," or, to go further back still, that "centuries before the Romans gained a footing in this country, the inhabitants were a polished and intellectual people, with a system of jurisprudence [he means our present common law] superior even to the law of Rome."

All this, however, is plain sober sense compared with Mr. Yeatman's treatment of the so-called Anglo-Saxon language, literature, and history. Not content with classing Saxon with modern German in particular as "gibberish," and with the Teutonic and Indian languages generally as no more worthy of study than "the lingo of the Christy Minstrels," he declares that it depends upon "wretched forgeries" for its very existence; that the Saxons, being in no sense a nation, but "a fortuitous concourse of atoms from various tribes," had "no traditions, no history, no language of their own, and no laws or liberty;" and that, in short, "the whole body of Saxon literature appears to the writer to be one huge lie," a forgery from beginning to end! Further than this, he has even laid his hand upon one, at least, of the forgers; for we are gravely asked to believe that the concoction of those "shocking impositions," the *Saxon Chronicle*, and Asser's *Life of Alfred*, as well as of other works in the same "lingo," was the amusement of the leisure hours of a mischievous "young Irishman," none other than Marianus Scotus, the chronicler. Having thus "safely" concluded that everything written in Saxon—codes, charters, poems, Gospels, and all—is apocryphal, Mr. Yeatman is not likely to find

much difficulty in disposing of the evidence against his theories which is to be found in the Latin works of Nennius, Gildas and, above all, Bede. So far as they can be made to support his own views, these writers are of course eminently worthy of credit; the misfortune is that "their books have come down to us stuffed, like fillets of veal, with Saxon garbage." "Very little consideration" satisfies Mr. Yeatman that "every notice of the Saxons which appears in Bede is a forgery;" and that, if we are to get at the real *Historia Ecclesiastica*, all the passages relating to them "should be incontinently rejected" as "morbid tumours and excrescences" due to those very industrious rogues, the "manipulators of Saxon lies."

Such are a few of the theories advanced with arrogant dogmatism in this astonishing volume; and they are not a whit more preposterous than the rest. Here, however, we must stop. We have neither space nor inclination to discuss the condition of England in the days of Tubal and Mesheck, or the management of the Record Office in our own, or any other of the various questions, more or less relevant to his subject, on which Mr. Yeatman exercises his talent for paradox and invective. We can afford, too, to pass over with a smile his rabid attack upon the "sickening baleful sprout" of Protestantism, and his assertion (interesting when read by the light of recent discussions) that the head of his own Church is still "the great arbiter of right and wrong," as when in the person of Alexander III. he blessed the expedition of William the Norman against a free and unoffending nation. To conclude, as Mr. Yeatman is fond of plain speaking, we feel no scruple in expressing our candid opinion that his work is a farrago of unmitigated nonsense. For the sake of those who seek his professional services, we fervently hope that he is, as he says, better versed in law than in history.

GEO. F. WARNER.

SOME TRACTS ON EDUCATION.

University Development in Scotland. (Reprinted from *The Perthshire Constitutional*, November 2, 1874.) This pamphlet has been published with the blameable irregularity of the omission of the printer's name and address; an omission which is imperfectly remedied by the statement that its contents are reprinted from a newspaper. Its author, however, deserves praise both for the thoroughness and originality of his opinions, and for the object which he has in view. The immediate aim of his writing is to make an appeal to that large portion of the educated public who are under obligations, direct or indirect, to the University of Edinburgh, for subscriptions toward the fuller development of that national institution. It appears that the university has already obtained from various sources the large amount of 70,000*l.*, and that a sum of only 30,000*l.* is now required to enable it to commence a long contemplated block of buildings, which are absolutely necessary for its primary wants. To give point to his appeal, and to illustrate the backward condition of higher education generally in Scotland, he takes the opportunity of sketching in outline the requirements of an ideal university according to the German model, and indicating the chief deficiencies which must be supplied before the metropolis beyond the Tweed has a university worthy of the name, and of her own position. He would,

of course, desire a material increase in the teaching staff, both in the professoriate and in the subordinate departments; and in his recommendations in favour of this object there is much that is both novel and important. He would have firstly a chair of Paedagogy, of which the name no less than the thing appears strange in this country; a chair of Celtic Language and Literature, in reference to which he remarks that Professor Blackie is at present engaged in an attempt to raise 10,000*l.* as an endowment for this very purpose, to remove a reproach of long standing against the universities of the North; a chair of Comparative Psychology, and another of Natural Religion. It must be admitted that he fortifies some of his proposals with arguments of a somewhat crotchety and polemical character; but in his general principles he is always sound. For example, he advocates the

"appointment of abundant class teachers and tutors to do all the rough work of drilling the younger students, so that the time of the Professor may be devoted to the cultivation of originality both in himself and his students; the latter should be relieved of all drudgery of whatever kind, free to extend his own fame, add to the *clat* of his university, and widen the bounds of knowledge by means of original research."

He would introduce also from Germany the system of the *privat-docent*, and recommends that "graduates should be encouraged to apply themselves to the prosecution of original work in literature, science, or the arts, by the provision of liberally-endowed fellowships, which might enable them *inter alia* to pursue their studies in other countries." He concludes with some severe strictures upon the method by which professors are at present selected for the Scotch chairs, and upon the universal jobbery which appears to exist in that part of the United Kingdom; and on this subject he displays such intimate knowledge of all the circumstances, and so much irritation of feeling, as to suggest irresistibly that the author of this pamphlet has been himself at one time an unsuccessful candidate.

DR. JAMES DONALDSON, Rector of the High School of Edinburgh, has republished his *Lectures on the History of Education in Prussia and England, and on Kindred Topics*. (Edinburgh: A. & C. Black.) So much is often vaguely asserted as to the superiority of the Prussian system of education, and so little are its details understood, that this concise and accurate account of its general purpose, and the historical summary of its development and progress down to the Falk administration and the *Regulativen* of 1872, possess special value at this moment. Dr. Donaldson has also studied with evident care and fairness the long series of documents, official and otherwise, in which is embodied the history of our English school-system. His fourth lecture, on the Relation of the Universities to the Working-classes, though suggestive, is disappointing. He argues admirably as to the relation of literary culture to the practical work of life, both in its lower and higher aspects. But he fails altogether to show by what methods a university, while fulfilling its first work, of cultivating the higher forms of learning and research within its own walls, can make its influence actually and directly felt on the operative class. In the lecture on the Science of Education the author is on surer ground, and draws from a wide and very varied experience. In an earnest plea for the establishment of professorships of didactics, or the science of education, at the Universities, he seeks to show how much a knowledge of the philosophy of mind would economize the powers of teachers, and facilitate and ennoble their work. The lecture has the merit—rare among enthusiastic writers on this subject—of honestly admitting that a tendency to regard psychological analysis as the basis of educational success may often prove a grave mistake; and that, after all, teaching, though a science, is very largely an empirical art, depending on quick insight, on sympathy with learners, on

variety of resource and on sleepless industry, even more than on a theoretical knowledge of what are called the laws of mind. On the whole these lectures are worthy of the author's high repute and standing as a schoolmaster, and are among the soundest and most valuable of recent contributions to educational controversy.

THE Hon. Dudley Campbell has reprinted from the *Contemporary Review* his thoughtful paper on *Mixed Education of Boys and Girls in England and America* (Rivingtons). It is a brief *résumé* of the main arguments in favour of the conjoint system of instruction, not only in schools for boys and girls, but in colleges and places of advanced instruction. These arguments are enforced by some very striking facts derived from the author's own observation at Antioch, Oberlin, and other high schools in the United States, in which the experiment of mixed education has been successfully tried. We do not regard this evidence as conclusive, since the social conditions of America differ much from our own, and since even in that country the plan is far from universal, and has not yet received the sanction of the best authorities. But Mr. Campbell's arguments are urged with candour and ability, and well deserve careful perusal.

MR. JOSEPH PAYNE continues his useful efforts to enforce upon schoolmasters and mistresses the importance of closer attention to the history and philosophy of their professional work. His latest pamphlet, *Fröbel and the Kindergarten System* (H. S. King & Co.), appears to us to have higher practical value than any of his recent writings on educational subjects. An interesting account of Fröbel's life and doings is followed by a careful analysis of the principles on which his methods were founded, and by a description of the Kindergarten method itself. By watching children at play; by noticing how their activities, their eager observation, their powers of invention and construction were called forth spontaneously, Fröbel came to believe that access to the hearts of children was to be gained by endeavouring to organise their play, to transform it into work, and so to lay, in harmony with Nature's own teaching, the foundation of a true education, both of the senses and the intellect. Hence the pretty devices which under the name of the Kindergarten have been so largely employed in the infant schools of our own country, and especially in Switzerland and the United States. Mr. Payne describes these devices in detail, and in a clear and attractive manner, and argues with much force in favour of a more general recognition of the truth of Fröbel's principles in the early education of children.

County Education: a Contribution of Experiments, Estimates, and Suggestions, by the Rev. J. Brereton (Bickers and Son), is mainly occupied by details of Mr. Brereton's very successful efforts in the foundation, first of a cheap boarding school for farmers' sons at West Buckland, in Devonshire, and afterwards of a proprietary school on a larger scale in Norfolk, which we observe was publicly opened amid many tokens of local sympathy and much promise of usefulness some days ago. Many of the plans, estimates, and practical suggestions as to school building and school economics generally are of considerable value, and may be consulted with advantage by managers and teachers of middle schools. The general views of Mr. Brereton on the mode in which the problem of secondary education for the lower middle class can best be solved appear to us to be of far less value. He thinks that great county associations of shareholders, each maintaining one or two large schools, are preferable to existing bodies of local trustees; and herein his view is certainly not confirmed by experience. He prefers the boarding-school to the day-school, even when the latter is accessible to the children of the farmer or the tradesman. And he not only objects to the efforts which are now being made to modernise and improve the country grammar schools, but proposes

a plan for sweeping all their endowments into a common stock, in order that in each county the great boarding-school or college of his own contrivance may be erected in their stead. His disposition to disparage other forms of educational effort, and his inability to make allowance for the very varied wants, tastes, and local traditions, which are satisfied by the ancient schools of the country, appear to us the most serious defects of a book otherwise full of useful suggestion, and distinguished alike by honourable enthusiasm, and by just views as to the kind of culture which the children of the English farmer most require.

EDITOR.

NOTES AND NEWS.

MR. SWINBURNE is progressing rapidly with his book on the progress of Shakspeare's style, and the first instalment will appear in the May number of the *Fortnightly Review*. He will shortly bring out a volume of his Early Poems, which will consist of the *Queen Mother*, *Rosamund*, those of *Poems and Ballads* which date from college years, and one or two pieces hitherto unprinted.

We are glad to learn that Messrs. Chatto and Windus are about to issue a complete edition of the works of Cyril Turner or Tournour, never before collected. It will be edited by Mr. J. Churton Collins, and will contain, besides *The Atheist's Tragedy* and *The Revenger's Tragedy*, some minor pieces in prose and verse. It has always been understood that Warburton's cook destroyed Tournour's comedy of *Laugh and Lie Down*, but Mr. Collins has had the tantalising good luck to discover the work with this delightful title, and to find, at the same time, that it is not a comedy at all, but a prose pamphlet. He has also discovered another tract on a scheme for planting tobacco in England. Tournour's gnomic poem, *The Transformed Metamorphosis*, which exists in a unique copy, will also be reproduced, but this proves to be extremely obscure and unlovely. Tournour's fame still rests wholly on his magnificent tragedies.

It is understood that the preface to the volume of Mr. Brewer's *Calendar of State Papers of the Reign of Henry VIII.*, which is now in the press, will contain an exhaustive review of the evidence on the Divorce of Catherine of Aragon, based to a great extent upon documents which have been hitherto unknown.

THE third volume of the *Paston Letters*, edited by Mr. James Gairdner, and completing the work, is expected next month.

AN interesting relic of the younger Scaliger is preserved in the Biblical collection in Lincoln College, Oxford. It is a Norwegian Bible, published at Holum in 1584, folio. At the bottom of the engraved title-page is written, probably in the hand of the giver, "Viro illustri incomperabili Josepho Scaligero Jul. Cæs. Fil. Geuerhardus Elmenhorst D. D." Elmenhorst, though much inferior to his friend in power or depth of knowledge, was a laborious scholar—"Vir diligentissimus et diffusissime lectionis." He formed one of the noble band of students who gathered round Scaliger at the then newly founded University of Leyden.

MR. SAMUEL ROBINSON has sent forth another of the elegant little volumes containing the result of his Oriental studies. His latest work is "*A Century of Ghazels*, or a Hundred Odes, selected and translated from the Diwan of Hafiz, a Persian lyrical poet who flourished in the fourteenth century."

PROFESSOR MONIER WILLIAMS has been engaged for some time on a new work called *Indian Wisdom, or Examples of the Religious, Philosophical and Ethical Doctrines of the Hindus*. It will give an historical account of the chief departments of Sanskrit literature, with English transla-

tions of select passages. The Indian Government has ordered several hundred copies of the work, which will be published at the end of next month.

MESSRS. A. J. JOHNSON AND SONS, of New York, are about to publish an *Illustrated Universal Cyclopaedia*, to be completed in three imperial octavo volumes. It is not to be a mere dictionary of reference, but will also contain essays by distinguished writers on their own special branches of knowledge. The editors in chief are Drs. F. A. P. Barnard and Arnold Guyot, and among the associate editors are the names of Professors Dwight and Asa Gray, and the late Horace Greeley. The list of contributors includes many of the best-known names both in Europe and America, and promises well for the success of the undertaking.

FOR the annual address of the President of the Philological Society (the Rev. Dr. Richard Morris), Professor Wagner, of Hamburg, will write the report on Latin, Mr. Davids that on Pali, Mr. Cust that on the Dravidian and modern Indian languages, and Mr. Morfill that on Russian.

DURING the visit of Professor W. D. Whitney, of Yale, to England this spring, the Philological Society, of which the Professor is an honorary member, will hold an extra meeting for the purpose of hearing a paper from him.

MR. SPEDDING's paper on the First Quarto and Folio of Shakspeare's *Richard III.*, in which he contests and refutes the view of the Cambridge and other editors that the folio was largely altered from the quarto by an inferior hand, will be read at the next meeting of the Society, on Friday, April 9, after Professor Leo's paper. As Mr. Spedding's argument necessarily involves the consideration of many passages and words in the differing texts of the play, his paper will be printed beforehand, and copies will be distributed to members at the meeting. This paper will also be the first in the Transactions of the Society for 1875.

MR. W. C. HAZLITT will issue in April, or early in May, a new *Shakspeare's Library*, in five volumes, foolscap octavo, price 30s. It will contain, not only all the Novels, Tales, Poems and Plays contained in Collier's *Shakspeare Library*, and Nichols's *Six Old Plays on which Shakspeare founded his King Lear*, &c., &c., but also several new Plays, Novels, and Stories, and all the Lives in North's *Plutarch* which Shakspeare used, with selected passages from Holinshed to illustrate *Macbeth*, *Cymbeline*, and *Henry VIII.*

M. PAULIN PARIS is correcting the last proofs of the fourth volume of his account of the Arthur Romances, *Les Romans de la Table Ronde mis en nouveau Langage*. The new volume will be the second of the Romance of Lancelot.

DR. KARL GOEDEKE's notions about Shakspeare's sonnets were translated by Mr. F. J. Faraday in the *Manchester City News* of March 5. The Göttingen doctor holds that the Sonnets were promiscuously thrown together; that some were addressed to Queen Elizabeth; that most were written to his wife, son, and daughter; specially Nos. 36, 29, 44, 45, 50, 51, 52, 110, while 108 is to his boy Hamnet, and 109 to his family; the eighth line of No. 108—

"Even as when first I hallowed thy fair name,"

Dr. Goedeke thinks must refer to Shakspeare having "at the baptismal font sanctified (hallowed) the beautiful heathen name of Hamnet."

THE *Revue Critique* notices an interesting book on Alsace and Strassburg, *Curiosités de Voyages en Alsace, tirées d'auteurs français, allemands, suisses et anglais, depuis le XVI^e jusqu'au XIX^e siècle, et annotées par Auguste Stoeber*. Starting with the Journal of Montaigne in 1580, and passing over the picture of Strassburg in 1600, from the Memoirs of Henry Duke of Rohan, we come to Bishop Burnet's sketch of Alsace in 1686 side by side with that by the Roman Catholic Bishop Flechier. Later occur those of Dom Ruissart, 1606;

Dom Martine and Dom Durand, 1708; Dom Calmet, 1748. Goethe's account precedes the Revolution; and that by our famous agriculturist, Arthur Young, relates the sack of the Hôtel-de-Ville, &c., which he saw. Many later authorities are given, and M. Stoeber has added plentiful and excellent notes.

THE Senatus Academicus of the University of Strassburg has made known the subject of the next "Lamoy" prize, of 3,000 francs, to be awarded in March 1879, and which is set forth as follows:—"What influence has been exercised on human and technical education in the lower and middle classes by modern forms of industrial development; and what light does the result of such enquiries throw on the question of the conflict between the requirements of technical art and its productions on the one hand, and on those of human and politico-social interests on the other hand?" Competition is open to all persons, without respect to age or nationality; and the essays, which must be sent in before January 1, 1878, may be composed in German, French, or Latin.

A GRAMMAR of the Greek language, written in Hindi, is a curious indication of the progress of European civilization in India. It is called *Yavan bhāshāka Vyākaraṇa*, a grammar of the Yavan language, Yavan being the name by which the Greeks—the Ionian Greeks of Asia Minor—became known at a very early time all over the East. This grammar, being published in India, shows that there is among natives, who do not know English, a demand for learning ancient Greek. As far as we know, there is no grammar of Sanskrit for the use of modern Greeks.

IN a little volume entitled *Fra Diplomatiens Verden (From the World of Diplomacy)*, Herr J. Hausen, a well-known and staunchly-patriotic Danish politician, gives extracts from his day-book which throw a good deal of new light on the difficult passages of intrigue at Paris and at Berlin that preceded the second Danish War. Regret is felt in Copenhagen that the author, who has been a good deal behind the scenes, refrains from confiding to the world his experiences later than 1866. Doubtless these also will follow in good time.

WE are indebted to the *Manchester City News* for the following report of the annual meeting of the Chetham Society, which was held on the 3rd instant in the audit room of the Chetham Hospital; Mr. James Crossley, President, in the Chair:—

"The Chairman read the thirty-second report of the Council, which stated that the first and second of the publications for the year 1874-5, and the 93rd and 94th in the Chetham series, consist of Parts I. and II. of the third and concluding volume of *The Admission Register of the Manchester School*, with some notices of the more distinguished scholars, by the Rev. Jeremiah Finch Smith, M.A. This volume carries on the register from the death of Mr. Lawson in 1807 to the resignation of the high mastership by Dr. Jeremiah Smith in 1837. An appendix of Addenda contains new notices of scholars and additions to those previously given. The third work for the year 1874-5, forming No. 95 in the Chetham series, is Christopher Towneley's *Abstracts of Lancashire Inquisitions*, edited by Mr. William Langton, Part I. With regard to the works in progress, Mr. Crossley said the first in order after Mr. Langton's second volume was the *Chetham Miscellanies*, the greater part of which would be edited by Canon Raine. He congratulated the Rev. Thomas Corser, who had taken in hand the *Collectanea Anglo-Poetica*, on the progress he was making. With regard to Worthington's *Diary and Correspondence*, which he had himself edited, he was happy to say that the concluding part would soon be ready for the printer. The other volumes, which were advancing towards completion, were—*Contributions to the History of the Parish of Prestbury, county Chester*, by Dr. Renaud; *The Lancashire Visitation of 1532*, edited by Mr. W. Langton; *History of the Ancient Chapel of Stretford, in Manchester Parish*, together with notices of the more ancient local families,

edited by Mr. James Croston; *Biographical Collectanea regarding Humphrey Chetham and his Family*, by Canon Raine; *Documents relating to Edward, third Earl of Derby, and the Pilgrimage of Grace*, by Mr. R. C. Christie; *A Selection from the Letters of Dr. Dee, with the Introduction of Collectanea relating to his Life and Works*, by Mr. Thomas Jones, librarian of Chetham's Library; and the *Correspondence of Nathan Walworth and Peter Seddon, of Outwood*, and other documents and papers in relation to the building of Ringley Chapel, prepared for the press by the late R. Scarr Sowler, Q.C. The Chairman concluded by expressing his deep sense of the loss which antiquarian literature as well as of scientific biography had sustained by the death of Mr. T. T. Wilkinson, of Burnley, and said that the town of Burnley had done itself credit by the respect shown to his memory.

"Canon Raine urged the advisability of publishing the history of the second class in the province of Lancaster, which included Bury, Bolton, Rochdale, and Dean, and extended from 1647 to 1657, which he understood that Mr. J. E. Bailey, whose *Life of Fuller* was known to them as one of the best religious biographies ever published, was willing to prepare. He believed that the history of the Manchester class was in the possession of the trustees of Cross Street Chapel, and might also be published.

"Lieutenant-Colonel Fishwick called attention to the valuable nature of the records of the Preston guild, and suggested their publication.

"The Chairman said that both suggestions would receive the attention of the Council."

THE French Academy has awarded the prize for a poem on *Livingstone* to M. Guillard.

At the sale of the Manley Hall library last Saturday, a copy of Redgrave's *Century of Painters of the English School*, interleaved with 1,166 engravings and numerous portraits of English artists, was sold for 132 guineas. The original two volumes had increased to ten by this means. The Manley Hall library was chiefly remarkable for its large number of modern illustrated books, and books of art reference.

THE historical and literary autographs collected by a foreign nobleman, of which we gave a short account three weeks ago, were sold by Messrs. Sotheby, Wilkinson and Hodge on the 17th inst. The large price of 82*l.* was realised by a letter of Queen Elizabeth to Henry IV., about the time when the latter was besieging Paris, while a letter of Mary Queen of Scots, to the King of Spain, entreating him to succour her, brought 65*l.* Other interesting royal autographs were:—Henry, Prince of Wales, son of James I., to the Dauphin, afterwards Louis XIII., dated Richmond, October 25, 1606, which sold for 34*l.*; James I. to Louis XIII., relating to the murder of Henry IV., 22*l.*; a letter of congratulation on the victory at St. Quentin from Mary, Queen of England, to Charles V., 81*l.*; Catherine of Aragon to the Cardinal of Santa Cruz, mentioning an alliance with the Pope, 43*l.* A second letter of Mary Queen of Scots, addressed to the King of France, went for 57*l.* Among other documents of historical interest were:—A letter of Sir Walter Raleigh to his nephew, Sir John Gilbert, 33*l.*; Cardinal Wolsey to the Pope, proposing Richard, Prior of Drax, as successor to the Bishop of Negropont, dated June 3, 1516, 12*l.* 10*s.*; Thomas Wentworth, the great Earl of Strafford, to his aunt, 25*l.*; the Young Pretender to Louis XV., from Edinburgh, October 15, 1745, announcing his first success, and urging the King to assist him, 70*l.*; Lord Nelson to the General of the Malta garrison, dated on board the *Victory*, August 5, 1803, 13*l.* 10*s.*; the Duke of Wellington to Talleyrand, June 29, 1815, to the effect that he did not consider the abdication of Napoleon afforded such guarantee to the allied powers as to induce him to stop his operations; but he should consider his object attained if Napoleon were given over to the allies—the French ought to call back Louis XVIII. without any conditions whatever, 11*l.* 10*s.* The remarkable letter of Robert Burns, several pages in length, fetched 60*l.*; one of Addison to the Lord Lieutenant of Ireland, 24*l.*; of Laurence Sterne to M. Foley, the Paris banker, written

from York, November 11, 1764, wherein he says, referring to two fresh volumes of *Tristram Shandy* sent at the same time:—"You will read as odd a Tour thro' France as ever was proposed or executed by traveller or traveller since the world begun:—'tis a laughing, good tempered satyr against travelling (as puppies travel)," 20*l.* Of James Thomson to David Mallet, from East Barnet, October 12, 1725, wherein he speaks of the dreariness of his present place of sojourn—"Flesh and blood can no longer endure to be exposed here, as in the bell-house of a steeple, to the raging elements," 20*l.* 10*s.*; of Sir Christopher Wren, June, 1699, respecting his inability to complete his professional engagements, 10*l.* 5*s.*

WE have received *Fasting Communion historically investigated*, by the Rev. Hollingworth Tully Kingdon, M.A., second edition (Longmans); *The Soul, is it, in its own Nature, immortal?*—an Essay, by a Layman (Elliot Stock); *Les Origines du Texte Masorétique de l'ancien Testament*, par A. Kuenen, traduit du hollandais par A. Carrière (Paris: Leroux); *Die Hausthier-Racen*, von Dr. Carl Freytag, 1. Bd., Pferde-Racen. 1. Lfg. (Halle: Waisenhaus).

A CURIOUS document, illustrating the state of men's minds when the news arrived of the Jacobite invasion of 1745, has been found among some old parish documents in the possession of a Lincolnshire yeoman. No copy of this paper, with the signatures attached, is known to be in existence. The one from which we print owes its preservation to its having some parochial memoranda written on the back.

In 1745 the squires of North Lincolnshire were most of them either avowed adherents of the exiled Royal house, or, what was a much worse thing, "whitewashed Jacobites," as Sir Walter Scott used to call them; that is, persons who, while taking oaths to and holding office under the king *de facto*, were prepared at any moment to betray their trust in favour of the king *de jure*. There is no room for doubt that if the invading force had crossed the Trent at Gainsburgh, as at one time many feared and hoped, a considerable body of gentry and yeomen would at once have joined Prince Charles's standard. So convinced was the High Sheriff of Lincolnshire—William Burrell Massenberd, of Ormsby—that the end of the Whig rule had come, that when he heard that the Pretender was marching on Derby, he called together secretly at Lincoln a meeting of persons whom he could trust—gentry, officers in the county trained band, and others—and proposed to them that they should enter the Chevalier's service. This traitorous counsel was heard gladly, and the High Sheriff himself was requested to repair to Derby with all despatch to meet "the Prince Regent." Massenberd set off at once, but only reached his destination after retreat had been determined upon.

"Whereas it is apprehended that the Rebels may make an Attempt to cross the River Trent in the County of Lincoln, or a Descent into the Isle of *Asholm* part of the said County. The Gentlemen whose Names are hereunto subscribed, met to consult for the Safety thereof, have come to the following Resolutions.

- "That An Account be taken of all the Arms, within the several parishes that attend or suit *Gainsburgh* Sessions, by the Constable of each Parish.
- "That All the Arms in each Parish be immediately put into good Order at the Expense of each Parish.
- "That An Account be immediately taken of the Gunpowder, and other Ammunition in all the said Parishes, by the Constables thereof.
- "That The several Owners of the said Arms be desired immediately to meet in their Parish Church-yard, or any other more convenient Place with what Arms they have, and there immediately to enter their Names with the Constables of their said Parishes, and engage

themselves to produce all the said Arms on the first Notice given them by the Constable.

"That The Constable of each Parish, do immediately cause six Stone Weight of Lead to be run into Bullets of Proper Size, and to provide ten Pounds of Gunpowder in each Parish and three Hundred Flints, or a greater Quantity.

"That A Meeting of the Parishioners in each Parish be immediately call'd in order to take down the Names of all such Persons as are willing to exert their Endeavours with the rest of the Country, for the Defence of the Isle of *Asholm*, the Town of *Gainsburgh*, and the *Trent-Bank*, as far as it extends itself along this County. Sign'd in the Sessions Hall at *Gainsburgh*, December the Third Day 1745. Here follows the Names of those Gentleman that sign'd the above Resolutions.

"Lincoln } To wit, To the Constable of in the
Lindsey } Parts and County aforesaid.

"You are hereby required to observe the above Resolutions, and to obey such Parts thereof as far as they are directed to you, as you will answer the contrary at your Peril. Given under Hand and Seal at this Day of One Thousand Seven Hundred and Forty-five."

THE following curious account of a dramatic performance at the Charterhouse, at a time when such diversions are generally supposed to have been prohibited, is contained in a document preserved among the State Papers of the Commonwealth. No other paper of about the same date has any reference to the subject, so the cause of its presence in such a collection is somewhat obscure. It is to be observed, too, that the last paragraph which we quote relates to a totally distinct matter. The document is endorsed "Junii 1656, S^r W^m Davenant's Opera," and runs literally thus:—

"The Bills for S^r Will: Davenants Opera are thus Intituled:—

"The Entertainment by Musick and Declamations after the manner of the Ancients.

"The Scene Athens.

"Upon friday the 23 of May 1656 These foresaid Declarations began att the Charterhouse, and 5^a a head for the entrance. The expectation was of 400 persons, but there appeared not above 150 auditors. The rome was narrow, at the end of which was a stage, and on either side two places railed in, Purpled and guilt, the Curtayne also that drew before them was of cloth of gold and Purple.

"After the Prologue (wth told them this was but the narrow passage to the Elizium theire opera) Vp came Diogenes and Aristophanes, the first against the opera, the other for it. Then came up A Citizen of Paris speaking broken English, and a Citizen of London, and reproached one another with the defects of each City in theire Buildings, Manners, Customs, Diet, &c. And in fine the Londoner had the better of itt, who concluded that hee had seene two Croche-tours in Paris both wth heavy burdens on theire backs stand complementing for y^e way wth, ceste a vous Mons^r: Mons^r vous vous Mocquies de Moy &c., which lasted till they both fell down under theire burden.

"The Musick was above in a hole railed about and covered wth sarcenets to conceale them, before each speech was consort Musick. At the end were songs relating to the Victor (the Protector). The last Song ended wth deriding Paris and the french, and concluded—

"And though a shipp her scutchen bee
Yet Paris hath noe shipp at sea."

"The first song was made by Hen. Lawes, y^e other by Dr Coleman who were the composers. The singers were Cap^t Cooke, Ned Coleman and his wife, another woman and other inconsiderable voyces. It lasted an houre and a haulte & is to continue for 10 dayes by wth time other Declamations will be ready.

"There was lately held at Marchand tailors Hall y^e Cockney feast of the better sort of Citizens borne wthin y^e walls at 5^a a man club, it proved so great a feast by y^e care of y^e City Cookes and cutters y^e the like hath not bine seene in y^e City, there dined 1000 in one rome, and 300 in another."

NOTES OF TRAVEL.

WE regret to learn from the German papers that the distinguished traveller, Dr. Nachtigal, is suffering severely from the effects of the fatigue and privations which he underwent during his six years' explorations in Africa. He is reported to have gone to stay at the sulphur baths near Cairo; and according to recent communications from Egypt, the Khedive, who had been informed that pecuniary embarrassments were added to Dr. Nachtigal's other difficulties, has with his usual munificence come forward to relieve him from all further anxiety on that head, and has even offered him the post of governor of the newly acquired province of Darfur, with the title of Pasha, provided his health should be sufficiently restored to admit of his entering upon the duties of the office.

A PAPER was recently read before the Bohemian Academy of Sciences on the travels of Dr. Emil Golub, a young scientific traveller, who in 1872 visited the diamond fields of the Vaal river with the object of adapting himself to the climate of South Africa, and preparing for a grand journey northward across the Zambesi to the equator. He furnishes a great deal of geographical information which modifies the existing maps of Griqua West Land and the Orange Free State to a considerable extent. He gives a descriptive list of eleven hitherto unnoticed tributaries of the Vaal river, which he crossed on his return to Dutoitspan, his head-quarters, from whence he proposes to start on his northward journey.

In the last number of the *Overland Monthly*, a magazine published in San Francisco, some interesting "Notes of a Naturalist at Mazatlan" are given from the unpublished papers of the late Andrew J. Grayson. During the seventeenth and eighteenth centuries, it appears, the Spaniards carried on the pearl-fishery in the Gulf of California systematically until the supply of pearl-oysters failed. About 800 divers were regularly employed, and the value of pearls exported was on an average 60,000 dollars annually. A scientific study of the fauna of this sea, however, only dates from the early part of the present century, one of the first and most extensive conchological collections made being that of a Belgian gentleman at Mazatlan, M. Reigen, which at his death was divided, part being sent to Havre and part to Liverpool. Dr. Philip P. Carpenter, in a catalogue of the species obtained from Mazatlan, says:—

"The very few that fell into my possession proved to be a little museum in themselves, each specimen so abounding in parasites, within and without, that I have described upwards of a hundred entirely new forms of molluscan life derived from this source alone, besides about 250 others which had not been personally investigated, or which are not yet determined—a variety of annelida, crustaceans, zoophytes, sponges, protozoa, protophytes, and algae—which are yet awaiting the attention of naturalists acquainted with these special departments."

After a description of some of the varieties of the limpet found on the beaches about Mazatlan, of which one (*Patella Mexicana*) is sometimes a foot in length and large enough to serve as a basin, a paragraph is devoted to the shells which produce a rich purple dye much sought after by the Indians. These shells are found further to the south. Mr. Grayson says:—

"I have seen them collecting this dye in the Bay of Banderas, below San Blas, from the shells as they clung to the rock. It is done by disturbing the shell, when the colouring substance is ejected by the animal, and caught in small cups by the collectors. This beautiful purple dye is held in high estimation by the natives, and is used to a considerable extent by the Zapoteca Indians in Tehuantepec for dyeing the cotton cloths of their own manufacture. Six yards of this cotton stuff, or enough to make a skirt for a woman, dyed with this peculiar dye, sell for 16 dols. or

20 dols. (3*l.* to 4*l.*). The shells of this class are not found very abundantly anywhere."

SOME interesting facts about the wood-carving industry of the Bernese Oberland are given in a recent official report from Mr. Jenner. This industry, which does not date further back than 1815, now furnishes employment for upwards of 2,000 workmen, and within the last few years the sales have risen to an average of nearly 80,000*l.* These sums have sufficed to spread ease over districts the inhabitants of which were formerly much pinched by want; the work, too, is of such a nature that it does not interfere with many other avocations. The cowherd and shepherd tending their flocks in the Alpine pastures, the charcoal-burner watching his fires, and the peasant families sitting round their stoves, during the long winter evenings, can, at the expense of but little physical exertion, add greatly to their store of comforts by means of some little skill in carving. A very large proportion of the cheaper articles are actually produced in this manner. The wages of regular workmen range from one to eight francs a day. Almost every variety of timber may be utilised; fir, lime, walnut, oak, pear, and apple trees have all their special applications, and of late years the most renowned makers have taken to carve "palissandre" or rosewood, mahogany, cedar, &c. Side by side with the wood-carving industry, but greatly surpassing it in pecuniary results, is the manufacture of parquets, which is of still more recent introduction. This trade is carried on in eighteen out of the twenty-two cantons of Switzerland, and is now in the most flourishing condition. As nearly as can be ascertained, the annual production of the twenty odd establishments which carry it on reaches the value of 8,000,000 francs (320,000*l.*). Scarcely a Swiss house with any pretension to comfort is now built without a parquet in at least one of its rooms.

In reporting to the Foreign Office on the forest land of Cuba, Mr. Graham Dunlop notes that, in proportion as the forests (especially in the plains and lower uplands) have been destroyed and cleared away, the rains have diminished from the want of influence on the clouds in the tropics; and, in many places the winding rivulets and sluggish streams, which were often dry near dense forests, have become fuller where the largest fellings took place, the roots of the trees having absorbed the waters in their drainage from the springs to the streams. Some check from the Spanish authorities on the indiscriminate fellings of timber which go on there is much called for.

In reporting on the trade of Hiogo and Osaka, Mr. Consul Gower mentions a curious fact:—

"A large portion of the bronze exported," he says, "has been furnished by the Buddhist temples. The discouragement given to that sect by the Government—anxious to favour and foster Shintoism, the ancient national religion—and the appropriation to Imperial purposes of the revenues of many of the temples, have induced the priests to realise as much of their moveable property as possible; and the massive bells, which formed such a striking feature of these temples, have, with other bronze articles of use or ornament, found their way into the hands of foreign merchants."

In his Report on the first fair held at Palampur, Sir J. D. Forsyth remarks that

"the Kangra district abounds in varied and valuable products. From the valley rice is exported to the extent of upwards of two and a half lakhs of rupees annually. Sugar is grown of such excellent quality that it is exported to the sugar-growing country of the plains. Hemp is produced of the very finest quality, and when compared with the Russian fibre was found to surpass it in strength and general qualities. A Report furnished by the East India House in 1854 showed that, whereas Russian hemp broke under a pressure of 160 lb., Kangra hemp stood a pressure of 240 lb. Iron is produced from the mountains equal to the finest Swedish kind. Tea has been successfully cultivated by both Englishmen and natives. China

chona is being introduced. China grass has been planted. Borax is imported from Ladakh. Wool is brought in large quantities from the sheep which graze over the pasture grounds of Kulu, Lahul, and Spiti; and woollen blankets of the finest description are manufactured by the inhabitants of those parts, who, however, have hitherto been unable to obtain any good market for their textures."

Notwithstanding its very favourable position in this neighbourhood, the Palampur fair has not yet proved so successful as was anticipated, but in concluding his report on that held at the end of last year, Colonel E. H. Paske advocates its maintenance on the ground that

"even as a local fair it is of some use, and within the next two or three years, when Mr. Forsyth's mission has accomplished its work, it will be seen whether a commercial treaty will bring down the trade from Central Asia to Palampur."

It is highly probable that the unsatisfactory condition of this fair is, in some measure due, as Mr. P. S. Melvill suggests, to its being "held at a most inconvenient time for the agriculturists of the Kangra district," for they are then "busy harvesting their crops, notably rice, and in preparing the land for the rabbi sowings." The same volume contains Reports by Dr. Cayley and Major Montgomerie on Trade Routes to Eastern Turkistan; papers relating to our trade with Tibet; and Major Clarke's Report on the Suda Fair, held in 1873.

PARIS LETTER.

Paris

I told you in my last letter that works on philosophy had for some time been regaining favour in France. Let me now describe more at length the different directions French philosophy has been taking of late, and the books it has recently produced. The imperious supremacy which M. Cousin exercised for a long period over philosophical study in France is well known. While doing good service in the field of philosophical history, he did his utmost to kill all speculation and free enquiry by making the adoption of the creed of official spiritualism compulsory not only in all the Lycées, but also in the different Faculties, and even at the Académie des Sciences Morales. It is necessary to know something of the excessive centralisation of our public institutions, and of the exaggerated influence acquired by certain members of our Academies, in order to be able to understand the authority M. Cousin exercised, first as Minister, and afterwards as a simple member of the Institut. M. Vacherot, who in his book *La Métaphysique de la Science* had given forcible expression to idealistic theories of a very exalted nature, was for a long time shut out as a heretic from the Académie des Sciences Morales. As for M. Renouvier, the friend of John Stuart Mill, who had the merit of being the first to restore, single-handed, in France the tradition of Kant, and of being the representative—a representative distinguished alike for his dialectical power and philosophical learning—of the critical school, he was purposely ignored, and remained in a position of such complete isolation as proved eventually fatal to his talents. As for the word "Positivism," hardly anyone dared to pronounce it. Such a state of bondage could not last; M. Cousin grew old, then died, and philosophy, long regarded with suspicion and persecuted during the first years of the Empire in every conceivable manner, was restored to honour by M. Duruy, who re-established it as a subject of academic study, and a movement of a serious character began which drew the minds of students in the most different directions.

The French philosophers of the present day may, it seems to me, be divided into three distinct classes: the disciples and direct successors of the spiritualistic school of M. Cousin; the disciples of M. Ravaisson or those who, like him, recognise that it is impossible for spiritualism to maintain its

ground, and endeavour to come to its rescue by a kind of metaphysical mysticism; and, lastly, those who, holding in other respects very different views, would apply to philosophy the rigour of scientific methods and found it on the observation and study of facts. Thus we have before us a spiritualist, a mystic, and a scientific school. Amongst the spiritualists, the two names best known at present are those of MM. Caro and Janet. M. A. Lemoine, a psychologist of great merit, is lately dead; M. J. Simon long since gave up philosophy to turn his attention to social questions and to politics; as for M. Lévêque, a professor high in the estimation of the ladies, he exhibits himself in his last book, *Les Harmonies providentielles* (F. Didot), rather as a preacher of religion and morals than as a philosopher. Lastly, M. Franck, who has just been re-editing his *Dictionnaire des Sciences philosophiques*, represents the less liberal side of M. Cousin, and has not thought fit to accord a place in his dictionary either to the German philosophers who succeeded Hegel, or to the contemporary English school.

MM. Caro and Janet are men of larger minds. The former is, however, a man of letters rather than a philosopher. As a brilliant professor and a distinguished writer he was admitted to the French Academy, an honour he well deserved; his best book, *La Philosophie de Goethe*, is almost wholly a work of literary criticism, and he seems to incline more and more towards giving up philosophy in favour of literature, or of an eloquent advocacy of morals. M. Janet, on the other hand, is a genuine philosopher, a philosopher from taste, I might almost say from duty. He is himself so strongly convinced of the truth of what he believes and teaches that he brings to his teaching that enthusiasm and modesty which are the result of deep convictions. He is not an original thinker, nor does he invent new theories or new systems, but he is an accurate historian, a shrewd critic, and a dialectician of the first order. He has never shrunk from following his adversaries to fight them on their own ground. When he saw the importance the natural sciences were acquiring in the study of philosophy, he set himself zealously to work to study them, and wrote his excellent little discussions, *Le Matérialisme contemporain*, *La Crise philosophique*, *Le Cerveau et la Pensée* (Germer-Baillière). The subject he has chosen this winter for his course at the Sorbonne is "La Psychologie anglaise contemporaine."

M. Janet has earned the respect and esteem even of his adversaries for his impartiality and earnestness of purpose. There are beside him a few young philosophers who take a similar line—M. Joly, the author of a very good book on *L'Instinct* (Thorin); M. Compayre, the author of a thesis on Hume (Thorin)—but, generally speaking, it is not under the banner of classical spiritualism, but in the ranks of the small school grouped round M. Ravaisson, that we find the most distinguished young philosophers ranged. M. Ravaisson does not on first acquaintance look like a philosopher destined to be the founder of a school. He is, above all things, an artist of fine discernment, a good violin player, and skilled in the painting of china; disdainful, too, not only of popularity but even of publicity. Twice only has he given public expression to his views—the first time in an *Introduction à la Métaphysique d'Aristote*, of which only one volume has appeared up to the present moment; and a second time in the concluding pages of a report on the study of philosophy in France, written on the occasion of the Great Exhibition of 1867. Without pretending fully to explain these views, I will here merely state that while the spiritualist school distinguishes clearly between God, whom it regards as pure and free spirit; nature, which it looks upon as subject to laws of necessity imposed on it by God; and man, half matter and half spirit, in whom liberty and necessity find a battle-ground; while it directs its principal attention to the idea of an efficient cause, the mystical school on the contrary

clings above all to the idea of final causes, and looks upon all beings as controlled in their development by the mysterious attraction of their ideal form. God, like the immutable motive force of Aristotle, attracts to himself the whole world of nature, which in all its various degrees aspires to an ideal superior to itself, and so escapes entirely the fatal and necessary laws which are alleged to exist. This school, the tendency of which I have thus roughly delineated, affects somewhat of a contempt for science and facts; it delights in pure metaphysics, discourses unceasingly of love, of attraction, of the ideal, till the question now and then suggests itself whether these are poets or philosophers with whom we have to deal. At the Ecole Normale it reigns supreme just now in the persons of two of its most eminent representatives—M. Lachelier, who till now has published only one book, *De l'Induction*, a work that is remarkable for power and concentration of thought, but he has given courses of lectures at the Ecole Normale on psychology, aesthetics, and the history of ancient philosophy, which I hope are not to remain sealed up in the notebooks of his pupils, but will before long appear in the shape of published volumes. M. Fouillée, who, with a mind, it is true, less precise than M. Lachelier, is nevertheless a very able writer, produced a great sensation with his book on *La Liberté et le Déterminisme* (Germer-Baillière). He has just published a *History of Philosophy* (Delagrave), in which, with most ingenious zeal, he discovers the elements of the doctrine of the new school existing in all former systems. Lastly, M. Boutroux, who is a writer of great ability, in his *Essai sur la Contingence des Lois de la Nature*, upholds similar theories with certain modifications in some points. The qualities common to all the philosophers of this school are great loftiness of ideas and sentiments, boldness of thought, and that contempt for received ideas which characterises all the mystics; their defects are an excess of metaphysical abstraction, and in spite of their pretensions to and efforts after mathematical precision, a vagueness of thought, or, in one word, obscurity. If these teachers are to be considered as its representatives, the spiritualist school seems to be quitting the ground of facts, of science and psychology, ground where it finds it difficult to defend itself, and to be taking refuge in the clouds.

Very widely opposed to this is the school I called the scientific school. Strictly speaking, it cannot be called a school at all: it consists of workers who, either separately or in small knots, are endeavouring to found philosophical speculations on facts of experience, and not to diverge from the methods that are admitted by the positive sciences. Among them, no doubt, the first place ought to belong to the Positivists and their organ, *La Philosophie Positive*, a review published under the direction of MM. Littré and Weyrouboff, were it not for the superstitious attachment they cherish for the teaching of Auguste Comte, which renders their philosophical labours absolutely fruitless. Up to the present moment, with the exception of M. Littré's articles, interesting as they always are, and of the more specially scientific researches of MM. Onimus and Weyrouboff, we have seen nothing very original proceed from their number. There is another influence which will become more fruitful, and which grows more important every day, the influence of the English psychologists, Stuart Mill, Bain, and Herbert Spencer. Their works have all been translated, and are read with avidity. I have no doubt that in a few years we shall see the fortunate results arising from the fact that English philosophy is now fashionable in France. M. Taine belongs in every way to this party, and his philosophical writings are the more interesting because his self-development was carried on not under the direction of those English thinkers, but side by side with them and contemporaneously. By his witty sallies in his *Philosophes français au XIX^e Siècle* he had formerly struck a terrible blow at the

school of M. Cousin. In his fine book, *De l'Intelligence* (Hachette) he endeavours to explain the formation of all our ideas and even of our reason, from the very moment, obscure as it is, of their origin, in our sensorial and cerebral system. This work will be followed and supplemented by a second volume on *La Volonté*. It were to be wished that physiologists would study this book *De l'Intelligence* very carefully with a view of verifying by their own experiences the theories and inductions of M. Taine. Though much younger and less original than M. Taine, M. Ribot devotes himself more exclusively to philosophy, and has contributed more than anyone else to the spread of the ideas of English psychologists in France. By his work *La Psychologie anglaise* (Ladrange and Germer-Baillière), he made them known before their books were translated. M. Ribot has recently been attacked with great severity in your pages by Mr. Galton with reference to his book *De l'Hérédité* (Germer-Baillière). The book is certainly not without defects, and M. Ribot will very shortly publish a new edition, revised and considerably modified. But he has the merit of having been the first in France to treat the question in a comprehensive and impartial manner, and to put forward some new views which are not without value. Mr. Galton accuses him of plagiarism; I trust the public will read the book before they endorse this accusation. So groundless is it, that it is due to M. Ribot's book that Mr. Galton's name is at the present day known in France. I felt it incumbent on me to undertake the defence of M. Ribot in this matter, because he is a conscientious modest worker, who is incapable of trying to put himself forward at the expense of another. He came to Paris to study physiology and medicine, and is engaged in preparing a work on the German psychologists for the press, similar to that which he has written on the English psychologists. Two portions of it have already appeared in the *Revue Scientifique*, one on "La Mesure des Sensations," the other on "Wundt." He has also lately published a treatise on *Schopenhauer* (Germer-Baillière).

In speaking of the school of scientific philosophy, I ought not to omit some mention of those writers who treat questions of physiological and natural science in their relation to philosophy as M. Luis does in his important treatise, *L'Action réflexe* (J. B. Baillière), but in so doing we should be leaving the domain of philosophy to enter on that of science more properly so called.

Beside those philosophers who can be at once classed as belonging to this or that party, there are others who stand aloof from all. As for instance MM. Charpentier and Liard, who specially devote themselves to mathematical questions in philosophy; and lastly M. Renan, whose ideas defy analysis and definition, but whose writings possess all the charm of beautiful verse.

I will add to this letter, which is, perhaps, of a rather technical order, some of the latest literary news. In December, 1874, I called attention to the appearance of the poetical works of André Chénier, published from the original manuscripts by his nephew, M. Gabriel de Chénier. M. Becq de Fouquières, who had published in 1864 and 1872 two editions of A. Chénier, together with most excellent commentaries, has just issued an interesting work called *Documents Nouveaux sur André Chénier et Examen Critique de la nouvelle édition de ses Œuvres* (Charpentier). Aided solely by a fine critical perception and literary knowledge of a very varied kind, he has rectified innumerable blunders in M. G. de Chénier's edition. He even shows that M. de Chénier has misread the lines he has appended in facsimile. He points out and corrects biographical errors made by M. de Chénier, and proves from the documents that if André Chénier was guillotined it was solely on account of his implication in the so-called prison conspiracy. He adds some very valuable notes on the friends of A. Chénier.

The literary correspondence of Proudhon and that of Lamartine continue to appear. Each of the series has reached five volumes. The last volume of Lamartine's letters (Furne) is most interesting. It comprises the period of *Jocelyn* and the *Chûte d'un Ange* and the poet's entrance into political life, and closes with the year 1842. The littlenesses that marked his character in youth gradually disappear and give place to a genuine enthusiasm for political and social progress, to which he then wished to consecrate his life, and to religious sentiments independent henceforward of all dogma, but deep and true in themselves. M. Maxime Du Camp has just completed his great work, *Paris, sa Vie, ses Organes* (8 vols., Hachette). He describes minutely all the varied machinery of that immense and manifold organism which we call a great city, its posts, its hospitals, its sewers, etc. Not only is the book an administrative and statistical treatise; it is a moral, psychological and historical study. Those who wish to understand France, her revolutions, and the part Paris plays in them, should read M. Du Camp's book.

CORRESPONDENCE.

THE INDIAN AFFINITIES OF THE GIPSIES.

In the ACADEMY of February 27, 1875, I read these words:—

"Professor de Goeje, of Leyden, has printed some interesting *Contributions to the History of the Gipsies*. He accepts the view propounded by Pott, as early as 1853, that the Gipsies are closely related to the Indian Jatt (a name which the Arab historians transform into Zott). . . . Dr. Trumpp has already pointed out the close resemblance between the European Gipsies and the Jatt of the banks of the Indus."

I venture to hope that you will permit me to show the part taken by myself in this question. *Sindh and the Races that Inhabit the Valley of the Indus* (London: Allen, 1851), written between 1845 and 1849, thus treats of the plain-peoples (pp. 246-7):—

"The Jat, or, as others write the word, Jath, Juth, and Jutt, was in the time of the Kalhorá dynasty

one of the ruling classes in Sindh. It was probably for this reason that the *Tohfut el Kirám* (a well-known book of annals) made them of kindred origin with the Belochis, who now repudiate such an idea with disdain. The Jat's account of his own descent, gives to Ukayl, the companion of Mohammed, the honour of being his progenitor; but what class of Moslem people, however vile, does not claim some equally high origin? As Játaki, the dialect peculiar to the race, proves, it must have come from the Panjáb, and the outlying districts, such as Ubho or Baladasht, Jhang-Siyál, Multán, etc., dependent upon the great Country of the Five Rivers. Driven by war or famine from their own lands, these nomads migrated southwards to Sebi and the hills around it. They are supposed to have entered Sindh a little before the accession of the Kalhorá princes, and shortly afterwards to have risen to distinction by their superior courage and personal strength. At present they have lost all that distinguished them, and of their multitude of Jágirdárs, Zemindárs, and Sardárs, now not a single descendant possesses anything like wealth or rank. Their principal settlements are in the provinces of Kakrálo, Játí Chediyo, Maniyár, Phuláji, and Johi. They are generally agriculturists or camel-breeders, and they appear to be a quiet inoffensive race. In the eastern parts of Central Asia, the name 'Jat' is synonymous with thief or scoundrel.

"The Sindhi Jats have many different karams or clans; the principal of which are the following:—Babbur, Bháti, Jiskáni, Jiya, Kalaru, Magási, Mirjat, Parhiyár, Sanjaráni, Siyál and Solángi."

In the notes to these passages (p. 411), I added:—

"Jat", or, written as it is pronounced, 'Dyat', has three significations: 1, the name of a tribe (the Jats); 2, a Sindhi, as opposed to a Beloch—in this sense an insulting expression—so the Belochis and Brahmins of the hills call the Sindhi language 'Júthki'; 3, a word of reproach, a 'barbarian,' as in the expression 'do-dasto Jat' (*lit.* a two-handed Jat), an 'utter savage.'

I continued:—

"It appears probable, from the appearance and other peculiarities of the race that the Jats are connected by consanguinity with the Gipsies. Of 130 words used by the Syrian Gipsies, no less than 104 belong to the Indo-Persian class of language. The rest may either be the remains of one of the barbarous tongues spoken by the original mountaineers who inhabit the tract between the Indus and Eastern Persia, or the invention of a subsequent age when their diffusion amongst hostile tribes rendered a 'thieves' language' necessary. The numerals are almost all pure Persian. There are two words 'kuri' (a house) and 'psik' (a cat), probably corrupted from the Pushtu (Afghan) 'kor' and 'pishu.' Two other words are Sindhi 'manna' for 'máni,' bread, and 'húi' for 'hú,' he. As might be expected from a tribe inhabiting Syria, Arabic and Turkish terms occasionally occur, but they form no part of the groundwork of the language."

It was my fortune to wander far and wide about the valley of the Indus, and to make personal acquaintance with many, if not all, of the wild tribes. I saw much of the Jats, lodged in their huts and tents, and studied the camel under their tuition. They are the best "vets" and breeders known to that part of the East. My kind friend, Colonel Walter Scott, of the Bombay Engineers, had a Jat in his service, and the rough old man's peculiarities afforded us abundant amusement. Thus I was able to publish in January, 1849, with the Bombay branch of the Royal Asiatic Society, a "Grammar of the Játaki (locally called) Belochki Dialect;" the author of the famous "Dabistan" applies the term "Jat tongue" to the language in which Nának Sháh (the apostle of the Sikhs) composed his *Grauth* and other works. In the Panjáb "Jatki bát" (Jat tongue) is synonymous with "Ganwár ki boli" (peasants' jargon) of Hindostan.

I wrote the word *Játaki* with two italics; the first denoting the peculiar Sindhi sound, a mix of "J" and "T," and the second being the familiar cerebral of Sanskrit and Prakrit—still lingering to a certain extent in our modern English. The tribal name is Jat", with the short terminal vowel

which follows the consonant in Sindhi, and the plural, *Játán*, ends with a marked nasal.

In the Grammar, which occupies forty-one pages, I divided this rude race of quasi-Bedawin into four great tribes, namely:—

"1. The Panjábí Jat, who is neither a Moslem nor a Hindú. He first appears in Indian history as a nomad, alternately cultivator, shepherd, and robber. Many became Sikhs, and did great benefit to that faith by contending zealously against Moslem bigotry, and, as this was their sole occupation for many years, they gradually became more and more warlike, and were at one time as fighting a caste as any in India. They have been supposed to be descendants from a very ancient race, the Getae (misprinted in p. 85 'Goths')."

"2. The Jat of the Hazárah country, Jhang-Siyál, Kach (Kutch) Gandáwa and Sindh generally, where they may number 250,000 out of a total of 1,000,000. He is generally a Moslem, and is supposed to have emigrated from the north during, or shortly after, the Kalhorá reign. In those days the Belochis were all but unknown in Sindh, and the aristocracy of the land, the Amirs, Jágirdárs, and opulent Zemindárs, were all either Sindhis or Jats. About Pesháwar the word 'Jat' is synonymous with 'Zemindár,' and as in Sindhi it is occasionally used as a term of reproach.

"3. A class of Belochis who spell their name with the Arabic, not the Sindhi 'J.' In Sindh they inhabit the province of Játí, and other parts to the south-east. The head of the tribe is entitled 'Malik' (master), e.g., Malik Hammál Jat.

"4. A wandering tribe, many of whom are partially settled at Candahár, Herat, Meshhed, and other cities in Western Asia; they are notorious thieves, and are held to be particularly low in the scale of creation. They are found in Mekrán and Eastern Persia, and they occasionally travel as far as Maskat, Sindh, and even Central India. No good account of this section has as yet appeared."

All four tribes are looked upon as aborigines, which only means that their predecessors are unknown. They are not wholly analphabetic: they write in the Nastalík, and sometimes in the Nashki character. In the preface to the Grammar I quote six books known to them, including a translation of *Háfiz*; one of them was shown to me in the Gurumukhi (Sikh) character. Their songs and miscellaneous poetry may be classed under five heads, viz., the "Rikhtah" of Hindostan, the Ghazal of Arabic and Persian, "Dohrá" or couplets usually sung to music, "Tappá" or short compositions of three, four, or five verses, mostly amatory and sung by the *mírásí* (minstrel); and "Bayt," an indefinite number of couplets. The latter frequently begin the lines with the letters of the alphabet in regular succession; this trick of composition is much admired, and probably the more so because the themes are, to speak mildly, vigorously erotic.

The first band of Jats was deported by the Arwám (Rúmi or Byzantine Greeks) in 865. The great conqueror whom Europe has apparently determined to call by his Shi'eh, or Persian nickname Tamerlane (= Taymúr i lang, or limping Taymúr), swept through the land in A.D. 1398-1400, and his horde must have caused a wide scattering of the weaker tribes. About this time, too, the Gipsies are known to have entered Europe, like their Keltic congeners of a far earlier date, viz Persia and Asia Minor. They called themselves, as all know, Egyptians, "Gitanos," "Egyptiens," and our Gypsy, or Gipey, is simply "Kubti," pronounced in Egypt "Gubti," a Copt. They invented a superstitious legend to account for their emigration from the banks of the Nile, possibly suggested by the racial name *Jatáni*, the adjectival form of the plural. The modern Arabic name of the nomads, still preserved in Egypt and Syria, is "Ghajar." Allow me to join issue with Professor de Goeje, who would explain "Zigeuner" (= "Zingaro," the older Italian form of "Zingaro") by "Shikári," a hunter, which he writes "Sjikári," or by "Tsjengán," the Persian plural (?) of *Tsenj*, a musician or dancer (Chang, a harp?). It appears to me a simple corruption of the Persian Zang, in Arabic "Zanj," a negro, a dark man.

These ideas occurred to me and were printed before 1849, at a time when the Orientalists of Europe had agreed to identify the Gipsies with the "Nath," a scattered trans-Indine tribe of mimes and musicians, utterly unaccustomed to horse dealing and cattle breeding—I may add poultry-plundering. And the conviction still holds its ground, only lately my erudite correspondent Dr. J. B. Davis reminded me of it.

Of course the humble linguistic labours of an explorer can hardly be familiar to the professionally learned world, but I cherish a hope that you will aid me, despite the length of this letter, in resurrecting my buried and forgotten work.

RICHARD F. BURTON, F.R.G.S.

SPENSER'S LAST LINES.

8 St. George's Square: March 20, 1875.

A lady at Bedford, No. 16* in the audience at my lectures on Elizabethan Literature in that town, has called my attention to a most interesting point in Spenser's *Faery Queene* that no biographer of his has yet noticed, so far as I have examined. It is this, that the latter stanza of the two which constitute the fragment of Canto viii. of Book vii., may well be, and most probably is, the last lines that Spenser wrote, on, or in view of, his sad deathbed in King Street, Westminster; so well do the lines breathe in words the wish, the prayer that he, after the last change in his life, the burning of his Irish home and one of his children, must have uttered:—

"Then gin I thinke on that which Nature sayd,
Of that same time when no more Change shall be,
But stedfast rest of all things, firmly stayd
Upon the pillows of Eternity,
That is contrayr to Mutabilitie:
For all that moveth, doth in Change delight:
But thenceforth, all shall rest eternally
With Him that is the God of Sabaoth hight:
O! that great Sabaoth God, grant me that Sabaoth's
sight!"

The singular appropriateness of these lines as Spenser's last, will, I believe, be gladly acknowledged by all students and lovers of him; and they will feel grateful, with me, to the Bedford lady who adds this memory of prayer and peacefulness of spirit to the poet's sad end.

The same lady suggests that the last line of Canto vi. Bk. vii.—"which too-too true that lands indwellers since have found"—may also have been written after, and in allusion to, the plunder of Spenser's house, or castle, at Kilcolman, in October, 1548; but robbery and spoil of the kind were too frequent in his time in Ireland to allow the point to be pressed; and Spenser names "Woods and all that goodly Chase" only, as abounding "with Wolves and Thieves." These words would not apply to the plunder and burning of Spenser's castle by men only.

F. J. FURNIVALL.

THE WORD "FYE-MARTEN."

Skipton, Yorkshire.

This word has been lately the object of some research, and much discussion among the critics of the earlier drama. No satisfactory explanation of its meaning has, however, yet been proposed. It occurs in a MS. date 1582, Feb. 22: "We went to the theater to se a scurvie play set owt al by one virgin, which ther proved a fye marten without voice, so that we stayd not the matter." Now, of "martens" proper there are in England two kinds, the *beech-marten* and the *pine-marten* (*Martes fagi* and *Martes abietis*). The *Martes fagi* or *fagina* was in French called *fau* or *faine*. *Faine* in English became *foine*, and *foine-marten* was in Yorkshire corrupted into *foul-mart* or *foumart*. This name was then transferred to the polecat as the *foul-marten*, the marten itself being called the

* Miss Marshall, of Kimbolton Road, as I have since found.

sweet-marten, and these latter terms are in common use at this day. So much for *faine*. What would *fau* be represented by in English? In other words, what would *fagi* become in our language?

We have seen that *fagina* became *foine* or *faine*. We should expect *fagi* then to become *faye* or *foye*. Let us compare a few other words in which the *g*, under French influence, disappears. *Alligare* becomes *allye* or *alie*; *denegare* becomes *denay* or *denie*; *exfrigare* becomes *affray*; *ossi-fraga* becomes *orfray*; *renegare* becomes *renay*. Forms in *aye* and *ye* or *ie* then equally represent the contraction that ensues on adopting a word from Latin through French, and omitting the *g* between two vowels; so that *martesfagi* would be either *fye-marten* or *faye-marten*. That the pronunciation in either case would be that of our word *fe* is proved in Mr. Ellis's great work on Pronunciation. As to the meaning of the word, anyone who has noticed the way in which *ficheu*, *polecat*, &c., are used by Shakspeare, will have no difficulty in seeing the antithesis to "one virgin" in the passage quoted above. *Fie* may take an under-sense corresponding to *foul*, as it still has in Suffolk.

F. G. FLEAY.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, March 27,	3 p.m.	Crystal Palace Concert.
	3.45 p.m.	Royal Botanic.
	8 p.m.	First night of <i>Rose Michel</i> at the Gaiety Theatre.
MONDAY, March 29,	8 p.m.	Royal Albert Hall: <i>Messiah</i> .
	8 p.m.	Royal Albert Hall: Grand National Concert.
	7 p.m.	Actuaries.
TUESDAY, March 30,	8 p.m.	First night of French plays at the Opera Comique.
	8 p.m.	Royal Albert Hall: Grand National Concert.
	8.30 p.m.	Chemical: Anniversary. Civil Engineers.
WEDNESDAY, Mar. 31,	8 p.m.	Royal Italian Opera, Covent Garden: Opening Night (<i>Guillaume Tell</i>).
	8 p.m.	Society of Arts.
	8 p.m.	London Institution: Dr. E. A. Freeman on "The History and Use of the English Language."
THURSDAY, April 1,	8 p.m.	Linnean. Chemical.
	8 p.m.	Signor Salvini as Othello, at Drury Lane.
	8 p.m.	Archaeological Institute.
FRIDAY, April 2,	4 p.m.	Geologists' Association.
	8 p.m.	

SCIENCE.

The Principles of Comparative Philology. By A. H. Sayce, Fellow and Tutor of Queen's College, Oxford. (London: Trübner & Co., 1874.)

MR. SAYCE stands in no need of being introduced to the readers of the ACADEMY, as they are already perfectly familiar with his name as one borne by a scholar who ranks second to none in the gallant band of investigators who have lately been doing so much to bring to the light of day the ancient records of Assyria, and to unearth the philological treasures of Accad. Hence, perhaps, some might imagine that the present work is, above all things, the utterance of a specialist; but so far is that from being the case, that its entire tone might be said to be distinctly anti-specialistic and corrective of the habits of the students of the Japhetic languages, who must plead guilty to being occasionally too prone to project on language generally the laws and tendencies which those they study have made them familiar with. In fact, the whole book may be regarded as a

* Othello iv. 1. 150; Merry Wives iv. 1. 30.

sustained protest against this kind of gratuitous generalisations, which are fascinating and tempting to our philologists, and for evident reasons, as will be seen from the following words of Mr. Sayce, p. 64:—

"One of the first assumptions of the glottologist, either openly avowed, or unconsciously implied, is, that a scientific investigation of the Aryan family alone will give a full and complete solution of all the problems of the science of language, helped out perhaps by a few illustrations from non-Aryan dialects. The causes of such an assumption lie upon the surface. Not only did Comparative Philology begin with the Aryan family; not only are its students members for the most part of that family, and best and primarily acquainted with some one or more of its dialects; not only does the historical position of Europe give to this group of languages an immediate and practical interest; but still more, it is here that the facts of language are most numerous, and its vicissitudes most accurately known, from the oldest hymns of the Rig-Veda down to the newspaper of to-day. When the great discovery of the affinities of this group dawned upon Schlegel and Bopp, and the commonest inflections of grammar were traced from dialect to dialect, and from century to century, it was impossible not to believe that what held good of the Aryan would hold equally good of all other tongues."

A little further on the reason appears why Semitic scholars have not lately distinguished themselves in a similar fashion; and that is, mainly, the fact that the Semitic family of languages is at once both too small and too compact, and that its branches do not differ more among themselves than do the Romance languages in Europe; so that until its Sanskrit has been found, as it may yet be in the Old Egyptian or the sub-Semitic idioms of Africa, we cannot, we are told, get back beyond a parent speech which is philologically late, and which fails to offer that facility for comparison which is needed by the young glottologist. *Glottologist*, I may remark in passing, the author uses advisedly instead of *student of comparative philology*; for at the end of his first chapter he tells us that, in the remaining ones, he avails himself of the term *glottology* as synonymous with, and far preferable to, *comparative philology*—an awkward and somewhat pedantic circumlocution to which German scholars, with their *Sprachforschung* and *Sprachforscher*, could not nowadays think of being confined. So it is to be hoped that Mr. Sayce will be followed by others in his adoption of the terms *glottology*, *glottologist*, and *glottological*. No better authority need be cited than Ascoli's brilliant but hitherto incomplete *Corsi di Glottologia*.

Unawares I have already plunged in *medias res*, and in order to give a more intelligible account of the work I must now retrace my steps with a view to consult the author's own account of it in the introduction, where we find that the substance of the first eight chapters was originally delivered as lectures at Oxford in the early part of 1873, and that the ninth and last chapter was a subsequent addition which may be regarded as strictly an appendix to the first. The work, as a whole, is rather critical than constructive, and the theories it criticises are summarised as follows:—(1) The belief that the Aryan languages are the standard of all others, and that the generalisations

gathered from their exceptional phenomena are laws of universal application. (2) The substitution of the mechanical and the outward for the intellectual and the inward. (3) The confusion between the convenient classifications of science and actual divisions into natural "families." A glance at the contents of each chapter in order will enable the reader to form an idea as to the plan followed by the author. Passing by the first chapter as devoted to defining the sphere of glottology and its relation to the other sciences, we come to the second, which treats at length of the *idola* of glottology with special reference to the laws of the science as determined from the Japhetic family of languages only: this has already been alluded to. The third chapter deals with the *idolum* of primeval centres of language; for not only does Mr. Sayce utterly disbelieve in any former unity of speech of Japhetic and Semitic nations, but he considers it idle to try to classify the existing languages of mankind, his view being that

"our sole wonder must be, not at the diversity of languages, but at the paucity of the wrecks of ancient speech that still remain spread over the face of the earth. The modern races of mankind are but the selected residuum of the infinitely varied species that have passed away: the same surely will hold good of language; and we ought no longer to be surprised at the multitudinous variety of dialects found in North and South America, in Australia, in the islands of the ocean, or in the continents of the Old World, but be content to believe that they represent but a small part of the extinct essays and types of language which have gone to form the language-world of the present day, like the numberless types that nature has lavished since the first appearance of life upon the globe."

One of the fundamental teachings of Mr. Sayce's book is that the units with which glottology has to do are not words but sentences, as language, he maintains, is based upon the sentence, not upon the isolated word, for the latter can mean nothing except interjectional vagueness, a point of capital importance nowhere so clearly and persistently proved as in the Celtic languages with their initial mutations of consonants, which, syntactically considered, may be said to mean that words *en phrase* have no individuality of their own. Considerable use is made of this position in the fourth chapter, which is devoted to the refutation of the theory of the three stages of development in the history of language. The author maintains that an isolating language could not become inflectional, but his views cannot be better expressed than in his own words (p. 164):—

"Without doubt the three successive stages of language mark successive levels of civilisation; this much is proved by the subversion of the one civilisation by the other; but each was the highest effort and expression of the race which carried it out, and the form which, by the constitution of the mind of the race, each was necessitated to assume. Mankind progresses as a whole, but the several steps of advance are made by the appearance of different races on the scene, each with his mission, each with his predetermined method of accomplishing it."

As I have always differed from Mr. Sayce on the important question of the origin of flexion, I could hardly trust myself to do

justice to his views in this chapter, which, if I am not mistaken, will elicit a good deal of controversy, especially on the part of Professor Whitney, whose opinions are repeatedly challenged in the course of it. Mr. Sayce's well-trained eye never fails to perceive linguistic differences, but I am not sure whether he does not occasionally make somewhat too much of them, as, for example, in the following observations (p. 158):—

"The Aryan languages have always been inflectional so far as Glottology has any cognisance of them. Beyond that, the Aryan must be dealt with by physical science; and whatever the latter may demonstrate, even that he was the eldest born of a gorilla, we feel sure of this much, that his brain could produce only an inflectional language, that is, could view things and their relations only in a particular way as soon as he came to speak consciously and to be a subject for Comparative Philology."

The succeeding chapter is taken up with the discussion of the question of the possibility of mixture in the grammar and vocabulary of languages; the conclusion arrived at is that glottology is right in the denial it gives to the old notion of the mixture of grammatical forms, but that is construed in a way not to exclude the imitation by one language of the idioms of another. The sixth chapter, on the doctrine of roots, is exceedingly suggestive, and abounds with telling criticism on untenable hypotheses which have been too long in vogue. The next, on the metaphysics of language, is to me the most interesting and fascinating in the book, especially that part of it which treats of the dual number, which Mr. Sayce successfully shows to have been prior—contrary to the usually received theory—to the plural, or rather to have been at one time the nearest approach which our very remote ancestors were able to make to a plural; for there seems to have been a time when *two* had exhausted their power of counting; all beyond that being to them vague, indefinite, and unintelligible—there are savages who are still in that state. The view here advocated throws new light on the reduplication, of which savages are so fond: thus, the Malay *raja-raja* "princes," *orang-orang* "people," must have once been duals as suggested by their form.

In the eighth chapter, on comparative mythology and the science of religion or dogmatology, the author defines the relations those two sciences bear to glottology, and follows Professor Max Müller in not considering myths as proved to be of the same origin in the absence of glottological evidence to that effect; for he maintains that,

"to imagine that the coincidence of legends among two races unallied in language means anything more than the common uniformity of intellectual action in the mythopoeic age, is to repeat the mistake of bygone writers, who believed that the story of a flood among different peoples bore witness to the Biblical deluge."

Thus it would appear that glottology stands in much the same relation to comparative mythology as phonology does to glottology itself, and it is phonology, as every student of language well knows, that sets up the barriers which prevent the fields of glottology and the allied sciences from being

overrun by charlatans with their fancy etymologies and fancy metaphysics.

But to close these remarks, which have already grown longer than originally intended, one may venture to say that the present volume, though merely the first fruits of what may be expected from the learned author, will not fail to be welcomed by the admirers of critical courage and independence of thought. No doubt it broaches views which he may sooner or later find it necessary to reconsider. But, on the whole, it has a truly cosmopolitan ring, and breathes throughout an uncompromising hostility to that spirit of authority and crystallisation which would fain see the science of to-day trammelled by the supposed discoveries of yesterday.

J. RHYS.

Comets and the New Comet of 1874. By the Author of "Astronomy simplified for General Reading." (London: W. Tegg & Co., 1874.)

THIS book appears to have been written solely to satisfy that craving for astronomical knowledge which possesses the general public whenever any unusual celestial phenomenon presents itself, and which appears to culminate in the apparition of a conspicuous comet. But with this desire for information there is usually a keen enjoyment of that delightful bewilderment caused by the sense of being a little out of one's depth; and this is enhanced tenfold when both writer and reader are floundering together. It is only on this principle that we can account for the appearance of the present work, for all the information which it contains is to be found in the usual text-books, though, it must be admitted, not presented in the same agreeable jumble. Variety is everything in the author's eyes, and accordingly he skips from the supposed discovery of Vulcan to the passage of the earth through the tail of the comet of 1861, and in the midst of a discussion on the orbits of comets interpolates a paragraph on spectra of comets, nebulae, and the aurora borealis. If this is the principle on which astronomy is simplified for general reading, we can imagine that the author's first effort must have been more amusing than instructive.

Having politely dismissed the late comet in a couple of pages, the author enters on the general subject, about which he has evidently read a good deal in popular works and acquired this much information, that the ablest men are at present unable to explain all the appearances presented by comets. From this he has apparently jumped to the conclusion that as it was all guesswork, he might as well try his hand at it; but it is rather dangerous work guessing where the laws of motion are concerned, and as our author totally disregards Newton's third law that action and reaction are equal and opposite, his conclusions sometimes appear rather strange to those who have a blind belief in the ordinary principles of mechanics. The following quotations will exhibit his standpoint clearly:—

"Possibly the contraction of the orbit may in some measure be due to the contraction of the nucleus when nearest the sun, and the non-con-

centric nature of cometary matter, combined with the continual shifting of balance which must be taking place from the chemical activity they display, as already mentioned in reference to Donati's comet and others. It is plain that the division of Biela's comet into two must have wholly changed the original orbit in that case, and possibly from leaving the parts with less mass to be acted upon by solar attraction and the same projectile force or tangential velocity as before, caused the two parts to extend outwards into space, and acquire much more enlarged orbits.

"Were Encke's comet . . . to divide like Biela's, or even very greatly to elongate in one direction from its nucleus, and thereby alter its centre of gravity with reference to solar attraction, we cannot well say what would be the result of such a change or modification."

On similar principles the author boldly accounts for the existence of parabolic and hyperbolic orbits, by supposing the comets to be really moving in ellipses round the same centre of motion (in the direction of the Pleiades) as the sun, quite overlooking the circumstance that the attraction of such a central body could only affect the relative motion of a comet about the sun as a perturbation which would be quite inappreciable, since the action of such a centre of force, even if no further from us than the nearest fixed star, would be sensibly the same on both sun and comet. But in this work we find a mysterious term "concentric attraction," which we can quite imagine to be capable of explaining these or even greater difficulties.

Our confidence, however, in this author's system of mechanics is somewhat shaken on finding that he is obliged to call in a wonderful and exceptional power to account for the circumstance that Lexell's comet suffered great perturbations from Jupiter; the rhapsodies which this event calls forth sound very grand, but are unfortunately founded on an utter misconception of the facts. Lexell's comet simply passed very near Jupiter, and its motion was much altered by the attraction of the planet; but it was not stopped in its path for four months, and then suddenly started off again with its original projectile velocity, as stated in this work.

No allusion is made in this book to one of the most important discoveries of recent times—the connexion between comets and meteors; and though much is said about Biela's comet, no mention is made of the remarkable star-shower of November 27, 1872, supposed to be an outlying portion of the comet with which we had come into collision; nor to Mr. Pogson's discovery of a comet (presumably Biela's) in the place indicated by Professor Klinkerfues on this supposition. Probably the text-books which the author has read were written before Schiaparelli's researches.

Another important point which is not noticed is the partial polarisation of the light of the tail in a plane passing through the sun; a fact which indicates reflection of sunlight from the particles of which the tail is composed.

To make up for these omissions the author treats us to some very wild speculations, the most startling of which is that the aurora is caused by comets' tails coming into collision with the earth; but why they are always

seen in the direction of the magnetic meridian we are not told. We have dwelt at some length on the fallacies contained in this book, because it seems calculated to do a great deal of mischief, by setting forth as the conclusions of science what are nothing but the dicta of a writer who has much to learn before he can safely undertake to teach.

W. H. M. CHRISTIE.

SCIENCE NOTES.

PHYSICS.

Specific Heat of Carbon.—The law enunciated by Dulong and Petit, that the product of the specific heat into the atomic weight of a solid elementary body is a constant quantity, was shown by Regnault to be of very general applicability, the numerical value of the constant (the atomic heat) being about 6.3. For three solid elements, however—silicon, boron, and carbon—considerably smaller atomic heats were obtained, viz., 4.8 for silicon, 2.7 for crystallised boron, and 1.8 for crystallised carbon. Examining in succession the various allotropic modifications of carbon, Regnault found their specific heats to vary between 0.1429 (for diamond) and 0.2608 (for animal charcoal). Contemporaneously with Regnault, De la Rive and Marcet found much smaller numbers for the specific heat of carbon. Again, Kopp and Wüllner obtained numbers differing from each other as well as from those of Regnault and De la Rive. The differences in the individual results are so great as to preclude the belief that they are due to errors in the methods of experiment or to impurities in the substances themselves. Dr. H. F. Weber (*Phil. Mag.*, March, 1875) attributes these differences to the widely differing ranges of temperature between which the specific heats were estimated. His elaborate researches show that the specific heats of these bodies increase very rapidly with the temperature. In the case of diamond, for instance, he found the specific heat at -50° C. to be 0.0635; at 247° it was 0.3026, and at 986° , 0.4622.

Studies on the Magnetisation of Steel.—The account of Professor E. Bonty's researches on the magnetisation of steel needles, the first portion of which was published in the February number of the *Philosophical Magazine*, and noticed in the ACADEMY, February 27, is concluded in the March number. In this latter portion Professor Bonty gives an account of some very interesting and important results which he has obtained. For instance, he shows that a formula given by Green in 1828 in his now celebrated *Essay on the Application of Mathematical Analysis to the Theories of Electricity and Magnetism*, and deduced from the hypothesis of coercive force, is strictly verified by the results of experiment when the lengths of the needles employed are not inconsiderable in proportion to their diameters. With regard to the breaking of long needles magnetised to saturation, Professor Bonty found that the fact of breaking had no influence on the magnetic moments of the broken halves, provided the original needle was tempered hard, so as to break between the fingers like glass. If, however, the steel was tempered soft, so as to bend several times before breaking, the two halves possessed unequal magnetic moments, the difference being due to the flexions which preceded the fracture. The author criticises the theories of Coulomb, Wiedemann and Holtz, and reviewing the whole of the known facts, argues the insufficiency of present theories of permanent and temporary magnetism to explain the various peculiarities of the temporary magnetism of steel. He suggests that in respect of the magnetic properties of its elements that substance must be considered a heterogeneous mass.

Currents of Electrical Machines.—In the last number of the *Annales de Chim. et de Phys.* (Sér. V.

vol. iv. p. 214), is an account of the investigations of M. Rosetti on the electrical currents produced by the Holtz machine, and published in the *Atti del R. Istituto Veneto*, vol. iii. 1874. The following are some of M. Rosetti's conclusions:—

The strength of a current produced by a Holtz machine is very nearly proportional to the velocity of rotation of the disc, provided the hygrometric state of the atmosphere remains constant.

The ratio of the velocity of rotation to the strength of the current increases with the humidity.

The effective work spent in each second is exactly proportional to the strength of the current; the ratio of the work spent to the strength of the current diminishes as the humidity increases. If the motion of the disc be maintained by a rotation apparatus, and if the weight which is necessary to turn the disc with a certain velocity when the machine is charged be called the *total moving weight*, the weight necessary to turn the disc when inactive the *partial moving weight*, and the difference between the total weight and the partial weight the *effective moving weight*, it is observed that the effective moving weight remains constant, whatever be the magnitude of the total weight, i.e., whatever be the intensity of the current. The effective moving weight is greater as the air is more dry.

The behaviour of Holtz's machine is in some respects analogous to that of voltaic couples. Its electromotive force and internal resistance are both constant if the velocity of rotation and hygrometric state remain constant. The electromotive force remains invariable for any velocity of rotation if the hygrometric state does not alter, but diminishes if the hygrometric state increases. The internal resistance is independent of the hygrometric state for a given velocity of rotation, but diminishes if the velocity increases.

In the Holtz machine the electromotive forces are enormously great in comparison with those of the most energetic voltaic combinations. For instance, when the hygrometric state is 0.35, the electromotive force of the Holtz was found to be more than 50,000 times as great as that of a Daniell's cell. Similarly, the internal resistances are very great; e.g., when the disc makes eight turns per second, the internal resistance was found to be equal to 570 million Siemens' units.

Ohm's law is obeyed by the currents of these machines; consequently, if in the external circuit resistances are introduced which are not negligible in comparison with the enormous resistance of the electro-motor, a diminution of the current will be observed conformably to the law of Ohm.

The Electric Spark.—Professor Antolik has given in the last number of *Poggendorff's Annalen* (vol. cliv., p. 14) an interesting (and somewhat diffuse) account of his experiments on the form and structure of the electric spark, obtained by means of an ordinary Holtz machine, or by connecting the inner and outer coatings of a charged Leyden battery. The electrodes between which the discharge took place consisted of two pieces of tin-foil about 2 centimètres long, and sharply pointed. These were pasted on a glass plate, the points being separated from 5 to 8 centimètres according to the strength of the discharge. It was also found conducive to good effects to paste the tin-foil electrodes over with thin smooth paper. The glass plate was covered with a fine deposit of soot from a sooty flame, and the spark, as it passed, traced its course on the surface of the plate so prepared. It was found to follow a zigzag path, with three, sometimes with five, parallel lines. Sometimes, and especially when the spark was powerful, it divided itself—always at a point nearer the negative electrode—into two or more branches.

When two prepared plates are employed, placed one over the other about two millimètres apart, the appearances presented by the passage of the spark are very beautiful on both plates. They differ, however, considerably from one another,

each having distinctive characters of its own. M. Antolik calls the picture impressed on the plate across which the spark really passes, i.e., whose electrodes are directly connected with the two coatings, the *active* picture; that, on the other plate, which is due to a kind of reaction, the *passive* picture. The active picture is characterised by a bright line forming its core, which is surrounded by a narrow brown border, whose distinctness increases with the strength of spark. Around this, again, is a bright portion, which is indeed the most conspicuous part of the whole spark-picture, and consists of a series of stratifications perpendicular to the central bright line. Outside these there is a bounding layer, generally of a faint and cloudy appearance. The passive picture has a dark elongated nucleus which is bordered by a bright portion, and this again by other portions more or less bright. The two pictures—the active and the passive—are in fact complementary. Many interesting variations in the forms of the spark pictures were obtained by compelling the spark to follow a certain track, which was done by painting a path for it on the sooty glass.

In rarefied air (about 20 millims. pressure) spark-pictures were also obtained, but were not so decided or so characteristic as those formed at the ordinary pressure of the atmosphere.

BOTANY.

MR. HENRY CHICHESTER HART, one of the naturalists appointed to the Arctic Expedition, has published a list of the plants found in the Islands of Aran, Galway Bay. From the geographical position and geological construction of these islands, their flora offers many features of interest. The geological formation of the islands belongs to the upper subdivision of the carboniferous limestone, and many of the rocks are replete with fossils. In several places large rounded blocks of conglomerate and granite are to be met with, evidences of a boulder drift from the adjoining shores of Connemara. Some of these measure seven or eight feet in height; they are called Connemara stones by the natives. The interesting feature of the flora is the presence of south-west European types, which reach this part of Ireland. The total number of species hitherto observed on this group is 372, about thirty of which the author claims to have added to those previously known. The luxuriance of the maiden-hair and other ferns abounding in the deep fissures of the rocks, and the diminutive forms of many flowering plants on the thin crust of soil covering the rocks in some places, are characteristic features of the flora. There are no species peculiar to these islands, but several of the commonest plants are of the Atlantic type of Watson. This enumeration includes only the flowering plants and ferns; the lower cryptogams are said not to be abundant.

DR. ALEXANDER PRYOR has announced his intention to publish a new *Flora of Herefordshire*. In a circular that he has issued, in which he defines the nature of the information sought to make his projected work as complete as possible, he solicits the assistance of all botanists whose residence in the county, or other resources, would enable them to render the desired aid.

THE *Oesterreichische Botanische Zeitschrift* has celebrated its twenty-fifth birthday, and Dr. Sko-fit, its editor and founder, was duly feasted and congratulated on the event. In the February number Dr. Niessl describes some new spheroid fungi—*Gnomonia misella*, *G. riparia* and *Chamaemori*. This paper is to be continued. The first part of an almost complete translation of H. C. Sorby's article on "Comparative Vegetable Chronology," by Alfred Burgerstein; and various short notes on descriptive and geographical botany complete this number.

DR. BUNGE's monograph of the species of the

genus *Oxytropis* has appeared. In the preface the author requests some indulgence for his work, and complains of the difficulties encountered in attempting a classification and discrimination of the species of this genus as compared with the closely-allied *Astragali*. He found it exceedingly difficult to devise satisfactory sectional characters.

No. 77 of the Botanical Section of the *Journal of the Linnean Society* is entirely occupied by twenty papers forming the commencement of a series of contributions to the Botany of the *Challenger* Expedition. It contains a number of interesting observations on the Flowering Plants, chiefly of Bermuda, St. Vincent, St. Paul's, Fernando de Noronha, Tristan d'Acunha, and Kerguelen's Land; a paper on the Freshwater Algae obtained at the boiling springs at Furvas, St. Michael's, Azores; and a number on the cryptogamous vegetation of the countries visited, in which several new species of lichens, fungi, and algae are described. A large portion of No. 78, just issued, is occupied by two papers on systematic botany; Notes on Indian Gentianaceae, by Mr. C. B. Clarke; and Additions to the Lichen Flora of New Zealand, by Dr. J. Stirton, consisting chiefly of technical descriptions of species. A valuable morphological paper is contributed by Dr. Masters on the Bracts of Crucifers, treating chiefly of the cause of the normal absence of the organs in that order; and a very interesting addition to our knowledge of Insular Floras is contained in Dr. Hooker's paper on the discovery of *Phyllia arborea*, a tree of Tristan d'Acunha, in Amsterdam Island, in the South Indian Ocean, with an enumeration of the phanerogams and vascular cryptogams of that island and of St. Paul. Surgeon-Major W. H. Colvill sends a paper on the vegetable productions and the rural economy of the province of Baghdad.

Carnivorous Plants.—Since Dr. Hooker gave his lecture at the Belfast meeting of the British Association on the carnivorous propensities of certain plants, some attention has been paid to the subject by other observers. The most recent contribution to this branch of botanical science is a paper by Mrs. Treat, of New Jersey, on the American species of *Utricularia* or bladder-wort, especially *U. clandestina*. These plants grow in water; the stems float on the surface, and are furnished with a number of bladders of very beautiful structure, composed of irregular cells, with clusters of star-like points, always four in number, arranged very regularly, and evenly distributed over the inner surface. These bladders are so constructed that when the minute insects which abound in the water in which they grow enter them, it is almost impossible for them to escape; they quickly perish and rapidly become absorbed or digested, as is shown by the coloured fluid from the bladders being transmitted to the neighbouring parts of the leaves and stem. Mrs. Treat found in almost every well-developed bladder one or more animal remains in various states of digestion. There was some variation with different bladders as to the time when maceration or digestion began to take place, but usually, in less than two days after a large larva was captured, the fluid contents of the bladders began to assume a cloudy or muddy appearance, and often became so dense that the outline of the animal was lost to view.

THE third and concluding part of volume xxx. of the *Transactions of the Linnean Society* is entirely occupied by Mr. Bentham's revision of the sub-order Mimoseae. In his introductory remarks the veteran systematist points out—what must inevitably be the case in any practically convenient system of classification—the great difference between the values in different cases of the characters on which different classes and genera are founded. Thus he remarks that the genus *Cassia* and the order *Compositae* resemble each other in these respects—that both are perfectly isolated; the pistil and seeds are uniform

in each; the variations in the corolla are scarcely more marked in the one than in the other; and the androecium and fruit present, if anything, more important diversities in *Cassia* than in *Compositae*; in fact, on purely abstract principles, the latter have as good a claim to be included within the bounds of a single genus as the former. And yet, because there are 10,000 species of *Compositae*, and only 350 of *Cassia*, the latter has been almost universally treated as a single genus, while the former is divided into genera varying between 750 and 1,200. The 1,200 *Mimoseae* are as uniform in their pistil as the 350 *Cassia* and 10,000 *Compositae*; the corolla is more uniform than in either; the androecium and fruit are much more varied than in *Compositae*, and they were established by Linnaeus as a single genus. They are here treated as a sub-order, divisible into six tribes, *Parkieae*, *Piptadenieae*, *Adenanthereae*, *Eumimoseae*, *Acacieae*, and *Jugeae*, and into twenty-nine genera. Mr. Bentham considers that the *Mimoseae* probably originated in some ancient warm country, whence they were enabled to spread gradually over the various tropical regions they now occupy, the greater number of the genera now existing having become differentiated before the disappearance or disruption of their original native country; and that the absolute identity of a few tropical species in the Old and New Worlds is in most cases due to human intercourse and commerce.

AN illustration of the laborious nature of German scientific-literary work lies before us in Dr. Just's *Botanischer Jahresbericht: Systematisch geordnetes Repertorium der botanischen Literatur aller Länder. Erster Jahrgang* (1873), *Erster Halbband*. The editor has had the assistance of above twenty-five "Mitwirkende," eminent in various branches of botanical science, and every department appears to be worked at with great assiduity. The value of such a work as this is seen on its face; its defects could only be ascertained by careful study; but so far as we are able to judge, it presents a valuable and complete bibliography of the year. The titles of the works are classified under various heads, so as to admit of easy reference, and of each of the more important ones an abstract is given, in many cases signed by the compiler as a gage of its trustworthiness. The amount of work annually turned out from the German botanical workshops (we have none in England, or only one or two) is truly amazing.

MEETINGS OF SOCIETIES.

LINNEAN SOCIETY (Thursday, March 18).

DR. G. J. ALLMAN, F.R.S., President, in the Chair. The following papers were read: 1. "On Thirty-one New Species of Marine Planarians from the Eastern Seas," by Dr. Collingwood. 2. "On the Resemblances of Ichthyosaurian Bones to the Bones of other Animals," by Mr. H. G. Seeley.

NUMISMATIC SOCIETY (Thursday, March 18).

MR. JOHN EVANS, President, in the Chair. A paper was read by Mr. Arthur J. Evans on the coins of Magnentius and Decentius, *à propos* of a hoard of 260 of these recently found at Alresford. The writer pointed out that Magnentius represented the conservative reaction of the West and the troops against the Oriental type of government introduced by Diocletian, and, in the beginning of his reign, the party opposed to Christianity. Corresponding with what might have been expected, we find in the early part of Magnentius' reign no Christian symbols on coins; the Emperor's head also is bare of the diadem. After the defeat of Mursa, Magnentius threw himself into the arms of the orthodox party to oppose the Arian Constantius, and at this period we find both Christian symbols and the imperial insignia. Mr. Evans supported his somewhat

novel theory of the reign of Magnentius by a careful review of his coinage, as well as with the testimony of historians and inscriptions.

ROYAL SOCIETY (Thursday, March 18).

THE following papers were read:—"The Behaviour of the Hearts of Mollusks under the Influence of Electric Currents," by Dr. M. Foster and A. G. Dew Smith; "On the Absorption Spectra of Metals volatilised by the Oxyhydrogen Flame," by J. N. Lockyer and W. C. Roberts; "On the Liquefaction, Fusibility, and Density of certain Alloys of Silver and Copper," by W. C. Roberts.

BRITISH SCANDINAVIAN SOCIETY (Friday, March 19).

HIS Excellency Baron Hochschild in the Chair. The first general meeting was chiefly occupied with the ratification of the proceedings of the committee, and with arrangements for future progress. Sketches of Norwegian scenery by Messrs. Thelwall and Pritchett, and a small collection of Scandinavian antiquities were exhibited.

PHILOLOGICAL SOCIETY (Friday, March 19).

REV. R. MORRIS, LL.D., President, in the Chair. Mr. Joseph Payne discussed the subject of the Old French or Norman element discoverable in the English *patois* of the Midland area. Before examining special words, he laid down the principle that many of the *patois* forms are explained by the difference between the laws of English and Old French accentuation. In naturalising French words the distinguishing or tonic accent, generally resting on the last syllable, was by the English rule transferred to the first or second syllable, the effect of which was to shorten or obscure the vowel or diphthong which had before been prominent and distinct. Thus *enchanteur* became English *enchánter*, *batáile*, *bátel* or *bátte*, *vicáire viker*, *gramáire grámmer*, *figúre figger*, &c.

It was also noted that the English tonic syllable became by this transference of accent almost invariably short, whatever might have been its quantity before. On these principles the writer accounted for the *patois* forms—*náppern* for *napéron*, *lábber* for *labóur*, *fávver* for *favóur*, *sávver* for *savóur*, *múttén* for *mútáine*, *dúbbler* for *doubler*, *árran* for *aráine*, *sóller* for *solér*, *púzzén* for *poissón*, *fízzen* for *foissón*, *mánnér* for *manúre*, *Múrry* for *Marie*, *bóttle* (of hay) for *botéille*, *cántle* (a corner) for *canéle*, *skúlet* for *ecuelette*, *réssón* for *raisón*, *créttur* *crúttur* for *créature*, *pápper* for *papier*, *béver* for *bevére*, *déssent* for *decént*, &c.

It was also shown, as a mark of the Midland *patois*, that there is a constant tendency to fling off the syllable preceding the tonic syllable, especially in words of French extraction—*fend*, *gree*, *noint*, *sry*, *stry*, *tice*, *tend*, *gin*, &c., from *défendre*, *agrée*, *enoint*, *descrier*, *destrúire*, *entúer*, *attendre*, *engin*, &c. This tendency sometimes—as was shown in reference to *mend*, *ray*, &c.—brings about a form which expresses the very contrary meaning to that of the original word. Thus, *amendér* is to free from blots or faults, *desráier* to throw into disorder; hence *mend* ought to mean to blot, and *ray* to put in order.

As to special words, the writer showed that *grudgeons*, *copper-rose* (Norfolk name of the red poppy), *gofers*, *hupil* (to disturb, harass), *lucam*, *carbels*, etc., were referable to the Norman or Old French words *grugeon*, *coprose*, *gauffre*, *houspiller*, *lucarne*, *garbouil*. The curious expression "a mort of people" was also compared with the Norman *patois* phraseology, "il y avait du monde à mort," "charger à mort," where "à mort" means in abundance, in excess.

The South Lancashire idiom, "a two-three miles," was also shown to be paralleled by the Guernsey *patois*, "chès deux-treis choses."

ROYAL INSTITUTION (Friday, March 19).

THE last Friday evening lecture was delivered by Dr. Liebreich, on "The Real and Ideal in Portraiture," but chiefly in portrait sculpture; painted portraits, though equally distinguishable as realistic or idealistic, being yet less suitable for the demonstration either of the effects of light or of anatomical facts; and these were two of the points on which the lecturer had to lay great stress. Greek sculpture, he began by saying, had worked out certain types of ideal beauty, between which and actual portraits was the difference conceived to exist between gods or heroes and ordinary mankind. In modern times the consequence of studying and copying these Greek types has been to produce sculptors who either implicitly followed out the classical models, or who sought to combine in some way Greek forms with a partial accuracy to nature and to modern habits. These are the idealists, compared with whom are the realists, who apply themselves exclusively, or profess to do so, to the observation of nature. If each class would keep within its own limits, there would be nothing to say. But unfortunately, the realistic sculptor in particular is constantly being tempted away, even in portraiture, from the living model before him, whose general expression he is satisfied to reproduce in a way, while the details, which would require the most careful observation, are worked out with a facility acquired by copying from the antique. The forehead of the Olympian Jupiter, the neck of the Apollo Belvidere, or the thorax of the torso of Hercules, is present to his mind, and guides his hand when he is engaged on the portrait of a mortal. The result, too often, is not only the loss of likeness, but the production of an imitation of a being not recognisable by naturalists as belonging to the human species in its present state of development. It was against this proceeding that the lecture was levelled. Greek portraiture, so far as it is known, i.e., from the time of Alexander onwards, was intensely true to nature. The same may be said of the large series of Roman busts or statues still existing, with the exception of instances where an emperor was represented in the character of a god. As an example of modern so-called idealism in portraiture, a cast from Chantrey's bust of Byron was exhibited and compared with an admirably realistic old bust of Dr. Ray. It was shown that if you covered only the familiar lock of hair on Byron's brow, the likeness vanished from the rest of the face, while, if you covered even one of the eyes and part of the brow of Dr. Ray, the likeness was not in the least diminished. On the other hand, when a bad light from below was turned on both busts, it appeared that Byron's suffered the least, and this, considering the frequency with which sculpture is exposed to light of this kind, might be an argument for trying to take advantage of it, by reproducing only the accidental characteristics of a face, and neglecting the essential features! Then followed a description of the essential features in a portrait bust—the skull, with the form of which not the slightest liberty was to be taken; and the skin, a source of great difficulty, requiring accurate anatomical and physiological knowledge in the artist, if he would distinguish between furrows or lines in the face formed by the habitual movement of certain muscles (and, therefore, expressive of an essential tendency of character), or by a temporary movement. But anatomical knowledge gained from the dead body must, before it is applied to copying from life, be corrected by physiological observation, and if this is fully done, the lecturer contended that a truthful reproduction of the external part of the human face might be accompanied with the animation and intellectual expression which constitutes the true idealism in portraiture. He concluded by strongly urging this method of studying on those who have the direction of schools of art, especially in cases where copying from the antique forms a large part of the training, and by its very nature tends to dull the appreciation of fine distinctions in nature. Casts

from several strikingly realistic early Florentine portraits, with some others of Greek and Roman origin, were exhibited in the theatre and referred to as illustrations of the main points of the lecture as they arose. In the library a series of modern sculptures or casts were arranged so as to show the true manner of lighting sculpture.

FINE ART.

Children of the Mobility. Drawn from Nature by John Leech. With a fine Portrait of Leech, and a Prefatory Letter by John Ruskin. Reproduced from the Original Sketches by the Autotype Process. (London: R. Bentley & Son, 1875.)

THIS is a publication of six sketches of the slightest description by the excellent draftsman and humorist, who, year after year, and week after week all round the year, gave us so many witty and brilliant satires and *jeux d'esprit*. If, as Mr. Pater has put it at the end of his *Studies on the Renaissance*, the best philosophy of actual life is that which affords the greatest number of pleasurable sensations—and, indeed, nearly all our daily activities and successes go towards this end—then John Leech was one of the men most deserving the gratitude of society. To how many thousands every Saturday, or Friday evening, did he not send a smile and a flash of light; and we cannot remember any instance in which he outraged good taste. On the contrary, he and the publication in which he worked were always on the right side, and must have done immense service to the *minor morals*, the manners, of the age. In an art point of view they were equally admirable, or nearly so: Leech's type of ladyhood and manhood was no doubt repeated over and over again, but then it always gave pleasure because it was excellent and so beautiful, and his children were ineffably charming, even when enacting the *enfants terribles*, first made so amusing by Gavarni. The mention of the illustrious French humorist, who was even abler as a draftsman than his English contemporary, suggests a comparison, and an instructive one, because so expressive of the national differences that indicate a substratum, we hope, still more distinct. The motive in Gavarni's pictures was very frequently a betrayal by means of the children of the infidelities of papa or mamma, or serious offences against truth, in either case by no means amusing to any party concerned, nor properly to the spectator either; while Leech's were invariably pleasantries, *gaucheries*, or evil manners properly punishable by laughter. The same may now be said of Leech's successors, but I am far from attributing the change to his influence; there can be no doubt at all that all caricatures take their colour and stamp exactly from the lamp-light and the matrix of the social life they illustrate and depend upon. The humblest of our comic or pictorial journals are not indecent; they may be sensational or even brutal, but direct indecency is left to our neighbours, and without it the *Journal pour Rire* and such like would find their occupation gone. The change with us had been going on ever since the day of Rowlandson, whose works were insufferably coarse; Kenny Meadows's cuts in *Bell's Life* were the earliest that

showed clean hands and that only occasionally, but his style of drawing was a little better than had before been seen in trivial comic prints, and he himself was far from being a vulgar or unaccomplished man.

Under the influence of Meadows, I remember John Leech first beginning his tentative designs. When I became acquainted with both of these men, Meadows was engaged on *The Heads of the People*, a series of sketches that still deserves some consideration as an exponent of the society and humble life of the day, while Leech had just dropped out of the ranks of medical, or rather surgical, student life, and his first productions, one or two of which I remember him then showing to the elder artist, were sketches of Parisians done on a visit to France, and published, I think, in *Bell's Life*. He was determined to follow the bent of his genius, but the pay was so little that he thought of painting comicalities instead of drawing them. One or two attempts in oil colours, however, convinced him that painting was an art beset by immense difficulties, technical adaptations, and, as he called them, artificialities, that would ere he attained to any success, warp and destroy his powers as a satirist and truth-teller. The fashionable dress of the moment was as dear to him as its manners and vices; and his despair on showing his first pictures to his friends, inspired by the evident impracticability of the square black hat and roll-collared surtout, as well as the difficulty his visitors had in answering his plaintive interrogative, why he could not be allowed to paint them and everything else simply as they were, we still vividly remember.

This was, as far as we can recollect, about 1839. Time gives a wonderful importance to events tiresome or trivial in passing, and now it is very interesting to recall this passage in Leech's life, and the contemptuous reply of Kenny Meadows that the things of the day were *ephemera* not worth embodying, except to get a guinea for pocket money, and then showing, very modestly, however, his own highly-finished water-colour painting, his last done, for Mr. Heath's *Book of Beauty* or *Shakespeare Gallery*. In these truth-telling was altogether ignored, that highly polished publisher requiring Mrs. Page to be represented just as young as her daughter, for the very absolute reason that nobody would buy the print unless the face was as young and pretty as a valentine.

Perhaps the reader begins to think I am wandering from my brief and its substantive, *The Children of the Mobility*. But it is not so; the surfeit of prettiness at last given the public by these "Books of Beauty," culminated in a volume of pictures called *The Children of the Nobility*, and Leech at the time made these drawings (now published apparently from imperfect tracings), to satirise the superfineness and the snobbery, which, however, collapsed and died out as suddenly as they had risen.

How these slight and evidently never finished drawings come to be published in this splendid manner requires some explanation. We should like to see *The Adventures of Mr. Briggs*, and various other sets of prints reproduced carefully—but perhaps that is not possible now—as they were poured

out in the shape of *Pictures from the Collection of Mr. Punch*, Christmas books, too soon after their first appearance, and too profusely printed, four or six or even eight on a page, to be highly valued. A selection of his best works will, no doubt, some day be done; meantime we can scarcely think the six sketches forming the subject of the present reproduction by photography, thrown off in 1841, important enough. The organist, one of the curses of Leech's later years, when continuous application to the amusement of the town had induced nervous impatience, called here *The young Denticci the Italian Instrumentalist*, and *The Flinn Family*, show something of the artist's appreciation of beauty in female children. *The Family of Mr. and Mrs. Blenkinsopp* has pathos, but the set as a whole is not of sufficient consequence to be produced by themselves. This the publishers have felt, as they have padded the thin quarto volume by introducing a portrait of Leech, a *Coat of Arms of the Mobility*, lithographic sheets of writing, and "A Preface," as it is called in the advertisements, "by John Ruskin." This preface, which is no preface at all, making no allusion to the subjects, or to Leech as an artist or satirist, is printed small, like the Lord's Prayer on a sixpence, surrounded by an absurd piece of Renaissance ornament.

WILLIAM B. SCOTT.

THE LINNELL EXHIBITION.

MR. E. T. WHITE, a picture-dealer who has been a large purchaser of recent works by our octogenarian but none the less highly vigorous landscape-master John Linnell, has collected together, at the Gallery No. 48 Pall Mall, sixteen specimens of the painter's skill, associated with a moderate number of pictures by other artists. The correspondence, actively carried on by Mr. White and others, regarding certain spurious copies of Linnell palmed off fraudulently as originals, will be fresh in many readers' recollection. Of the Linnell works now exhibited, the only one that bears a remote date is a small and fine *View near Bayswater, Sunset*, executed in 1820. The recent ones may be somewhat thinner and sketchier in handling than when the painter was in his prime; but, for knowledge, picturesque perception, abundance, and sureness, they would stand high, if matched against the productions of any other living master. Some of the best examples are *The Barley Harvest*, *The Pons Asinorum*, *The Woodcutters*, *A Storm in Harvest*, *Down Rays*, and *Harvest Home*.

Trade-interests, rather than anything pertinent to the essence of the exhibition, may have been served by the display of the works by other painters. Some of these are trivial or objectionable: for instance, *Prince Charming*, by Mr. Pettie, is of no higher rank than those photographs so numerously presented to the eye in shop-windows, gregariously termed "leg-pieces;" nor should such trumpery as the *Crowned with Flowers*, by Mr. Baxter, have found admission here. It seems at any rate a pity that the Linnells should have been scattered over the walls, instead of forming one compact assemblage. Pictures of creditable standing, already well known, are—Calderon's *British Embassy in Paris on the Day of the Massacre of St. Bartholomew*, Watson's *Pet of the Common*, and Poole's *Banquet Scene from the Tempest*. *Prince Arthur and Hubert*, by Mr. Pott, is recklessly anachronistic in showing us a tapestry proper to some such date as 1550. *A View in Italy* is a good specimen of William Linnell, the protagonist's son. *Visitors from the Outer World*, by Cataneo, is a refined and impressive conventional picture, with a peasant woman and her daughter gazing at the nuns as they pace the jealously-shut

garden precincts. *La Réprimande* by Henrietta Browne, *The Farmer's Daughter* by Pettie, and *Falling Leaves* by Boughton, are worthy of note amid the residue.
W. M. ROSSETTI.

THE STUDIOS.—VI.

WHEN Mr. Burne Jones's painting, *The First Mirror*, was yet in an early stage of progress, the design was described in these pages. It is now far advanced towards completion, and is fulfilling all the incredible promise which it gave from the very commencement. Then, Venus and her group of kneeling disciples gleamed like pale pearls in the still quiet of the solemn landscape; now, they glow before our eyes resplendent with the full passion and mystery of colour. Venus, the all-powerful goddess, has guided from afar a willing band of maidens. She stays their steps with a mute gesture of authority on the edge of a clear pool, which lies a sheet of glass fringed by myriad blooming forget-me-nots filling the wide foreground. All have sunk on their knees, and gaze entranced by the sweet magic which shows them the reflections of their own forms mirrored on the placid surface of the water. The centre figure stoops boldly forward resting on the palms of her hands, and looking intently into the depths below; behind her kneel three of her companions. Either side of this central group comes a little break, then on the left rises the dominant figure of the goddess shrouded in misty draperies, grey tissues, thin and cold as waving wreaths of morning cloud. At her right hand, stooping partly forward, stands a young girl, her eyes eagerly fastened on the face of Venus, seeking, as it seems, to read the full meaning of her leader's mind. This figure is repeated and varied in gracious balance on the opposite side of the central kneeling group, and finally the lines drop on either side like wings softly unfolding, for two other maidens kneel lowly couching close to their stooping companions. Then the circle is completed by the chain of reflected images on the water, which loops across from side to side connecting either point. The robes of the kneeling maidens burn with changeful brilliance of colour. They are ranged round the dead quiet of the cool water, which sleeps buried in its thick-set border of innumerable blue blossoms, even as might show so many lamps of live flame shooting rays of fitful hue. Out of their midst towers the grey-white form of the goddess, shining pale with a faint opalescent light, her eyes wide in strange vision looking on to the coming of many mysteries. Behind the kneeling band, grandly upheaved against the sky, rise slowly the weighty forms of bushless downs. Vast shapes of earth now poured out as in the youth of the world, unfretted and unworn by terrible agencies yet undeveloped, but destined later to tear and rend the land. The tranquil embrace of morning lies upon the hills, and folds them in the peace of promise. The great curves of the mountain background which vary and accent the sinuous chain of figures that girds about the still waters sweep across a sky serene with the hopeful light of early dawn. Before us kneel the mothers of the race which shall be. They kneel with the message of days to come on their lips, and the spirit of the tale which shall be told looks out upon us from their eyes.

Laus Veneris brings us to a later hour. Women have worked alone the long day. They are worn with their toil, and the dreams of unsatisfied longing lie heavy on their weary souls. Some gather about a desk near an open window. They sing. Their lips, their eyes, their very movements repeat the refrain which we trace on the leaves of the book open before them, *Laus Veneris*. One has drawn apart, beneath the tapestried wall of the narrow chamber. She sits apart, too sick for song:—

"My length of days goes swiftly down,
The thronging hours have brought no crown;
The hours, the days, no pleasure prove,
I have not seen the face of Love."

But even now fate has sent to the love-sick damsels those for whom they wait. Through the open window we see knights riding by. They hear the song, and at the hearing they will stay their steeds. This design also is resplendent with all the glory of lovely colour. It is yet unfinished, but portions, such as the orange-red robe of the damsel on the right, woven over with curious pattern of scale-work half hidden, half revealed, and again the deep cool tones of the tapestry close against which this figure sits, show the key in which the whole harmony will ultimately be pitched.

The Feast of Peleus, which has also been previously alluded to in these pages, is but a portion indeed of a large scheme, planned originally to be carried out with attendant accessories of bronze-work and marble; but which it is to be feared will remain a project only realised on canvas. The framework of marble and bronze should have contained six pictures. The centre design shows *The Judgment of Paris*, beneath this is inserted *The Feast of Peleus*. Then, on the right hand, we see a vision of Aphrodite. Her statue looks to Paris, and grants him fair Helen. Beneath this design is placed a peaceful picture of happy lovers, whose bliss is guarded by the presence of the goddess herself, enthroned, and bearing on her knees the fateful apple awarded by Paris. But on the left are other sights—the fiery burning of Troy town, the fall of Aphrodite's statue, the crouching figure of Helen captured by the wrathful Greeks; and below this picture, fulfilling all its awful threat, passes the dread spectacle of the torments which are the miserable portion of unhappy love, the band of helpless sufferers driven by the cruel authority of the merciless god who sits aside, and with eager gestures appoints to each his allotted portion of woe. As a whole this design is scarcely beyond the point of commencement. *The Feast of Peleus* only has been painted by Mr. Burne Jones on a separate canvas, and one or two of the other subjects have but been sketched in. And now, again, in this nearly completed picture of the *Feast*, the colour challenges the eye with the prick of keenest pleasure. It is brilliantly lovely, and it is only when we come patiently to examine it in detail that we begin to understand how it is that this extraordinary effect of radiance is brought about. Every little passage is in itself a study for purity of tone and matchless delicacy of hue. The gleaming gold flashed with faint lilac which shows in the corselet of Minerva is a moment of effect felt with the most exquisite sympathy of quick and intense sense. Everywhere the same vivid passion of sight has gone to the seeing, not only of colour but of form. The accidents of manner which once were sufficient to disturb the enjoyment which many might otherwise have felt in the work of an artist of the rarest type, have long since disappeared. Before work such as that of the *First Mirror*, for instance, we are now left defenceless, charmed by the resistless force of an attraction which sucks up from us all energy. We are absorbed in mere sight and feeling, we drop off at last after long looking in a great fatigue of soul, with senses filled to the edge with pleasure.

But the paintings which we have mentioned are but three among a number of works now lying in Mr. Burne Jones's studio. Seven designs of the *Seven Days of the Week*; four designs of the *Story of the Briar Rose*, destined for wall decoration; designs for tapestry; a painting of Merlin and Vivien; of Luna, and many others, are there, all showing the same qualities of noble design and poetic invention. In all we see the expression of the habitual strain of a mind ever selecting from things visible those facts which may fitly give shape to the conceptions of a fervid imagination, stimulated by a precious sensitiveness to the highest forms of beauty, and sustained by unwearied industry which day by day stores up the rich results of stricter discipline, and passes onward to fresh triumphs. E. F. S. PATTISON.

THE BRITISH ACADEMY OF ARTS AT ROME.

THE British Academy of Arts in Rome is an institution that one would imagine would readily commend itself to the notice of all those concerned in art matters in England. Considering the splendid Academy that the French Government is able to support in Rome, it seems somewhat hard that our poor little English school should languish for want of encouragement and subscriptions. A short time ago it seemed as if it must be given up altogether, the secretary having last year intimated his utter inability to carry on the school with the interest of the fund placed at his disposal. In this state of things a committee was formed to investigate the affairs of the Academy, and the report made by this committee last January now lies before us.

It will be seen into what a state of neglect all business connected with this Academy had fallen, when it is stated that for twenty-one years there had been no committee of management, and that its direction had wholly but illegally devolved on the late Mr. Gibson, R.A., and the late secretary, Mr. C. Coleman. No rules had been printed during this time, and when the present committee began their work of investigation the books and papers of over fifty years had to be examined in detail and classified. After this was done and a careful statement gained from the bankers, Messrs. Plowden and Co., it was too truly found that the income of the Academy scarcely amounted to 2,300 lire (about 90*l.*) per annum, a sum obviously inadequate for the necessities of the school. Under these circumstances it was determined to appeal to the public for assistance, and accordingly circulars were printed and sent with letters to the Royal Academy, the Royal Scottish Academy, and to each individual member of those bodies, and many other influential persons in England. The Scottish Academy immediately responded by voting a sum of 50*l.*, but, strange to say, the Council of our Royal Academy in London, which in the time of Sir Thomas Lawrence accorded the most generous support to the then infant institution at Rome, have intimated through their Secretary that they are unable to afford any help in its present difficulties. The subscription made last year among the artists of Rome was, however, most encouraging, and Mr. Halswelle also collected a sum of 100*l.* in London, so that it is still hoped that the endeavour now being made to organise the Academy on a more efficient and extended basis will be successful. One difficulty that pressed heavily on the committee last year has fortunately been removed. It was thought then that it would be necessary to remove the Academy from the premises it at present occupies, as the landlord Signor Girelli had announced his intention of making various alterations and of raising the rent. This removal of the heavy casts and other property of the Academy would have entailed a great expense, and in the present state of things in Rome it would have been almost impossible to find premises sufficiently commodious that did not exceed in rent the resources at command. In the ACADEMY of February 27 it was stated that application had been made to our minister, Sir Augustus Paget, to obtain the sanction of government for the purchase of a vacant convent on the Pincian Hill as the *locale* of the Academy, but all thought of removal has now been set aside by Signor Girelli agreeing to make certain necessary alterations and repairs on condition of a slight increase of rent. The committee consider this arrangement in every way satisfactory, and nothing is now wanted to ensure the working efficiency of the Academy but some little aid towards defraying its very moderate expenses. It will surely be something of a reproach to the Art authorities in this country if this aid is not forthcoming. Unlike the other foreign Art institutions in Rome that are fostered and encouraged by their respective governments, it must be remembered that the British Academy receives no help from the State, but owes its existence to

private enterprise, and is entirely dependent on private aid. It was founded in 1823 for the purpose of maintaining "a free and permanent school for the benefit of all British artists studying in Rome," and among those who have availed themselves of its benefits may be mentioned such artists as Etty, Gibson, Eastlake, Wyatt, Rennie, Barry, Hook, Armitage, Leighton, Poynter, Yeames, Prinsep, and others of equal note.

Of late years, of course, the efficiency of the Academy under such a long era of mismanagement has greatly declined, but there seems good reason for believing that the exertions now being made will tend to raise it to a higher position than it has hitherto held. MARY M. HEATON.

THE ESQUILINE AND PALATINE HILLS.

Hotel Costanzi, Rome.

The Esquiline Hill continues to be the principal centre of public works and antiquarian discoveries, most noticeable among the latter class being a bust of a woman (probably ideal) of much beauty, destined, with other such treasure-trove, to have its final place in the Capitoline Museum. The splendid pavement of a ruined hall (or temple), which I have already mentioned, has lately been removed, for its preservation, from the area occupied by its rich marbles and alabasters on the same hill; and it is reported that in the course of such transfer it is found to contain alabasters of no fewer than 200 species. Near the same spot have been discovered the remains of another ancient building—a mansion with paintings of some interest on the stuccoed walls. The number of houses more or less like patrician houses found on this hill confirms the statement that in the reign of Constantine a population of 200,000, almost equal to that of all Rome at the present day, inhabited the three zones into which the Esquiline is divided.

The works on the Palatine Hill—commenced by order of its former owner, Napoleon III.—were prosecuted under the new Government, after the purchase of that ground from the ex-Emperor in 1870, during more than a year with some vigour, but with no such valuable results as had previously been obtained. Before the end of the year 1873 they were, to the regret of many, interrupted, all activities being thenceforth diverted to the Forum and Flavian Amphitheatre. I am glad to say that on January 15 the *scavi* on the Palatine were resumed, and on the spots where the hitherto discovered ruins (long buried and unknown) are most interesting because marked with the character of highest and most venerable antiquity. On the western ridge of this hill, which overlooks the now cultivated and almost uninhabited valley of the Circus Maximus, were brought to light, a few years ago, groups of buildings the primeval origin of which is strikingly manifest, and the dim twilight of a perhaps prehistoric past seems more mysterious here than among almost any other extant ruins in Rome or its environs. The theory maintained by Signor Rosa—still, as under the French Emperor, the director of the works on this hill—and indicated in a quotation from the *Aeneid* on a tablet set up among these Palatine remains—

"Tum rex Evander Romanæ conditor arcis,"
(*Aen.* viii. 506.)

—is that he traces here the veritable *arx* of Evander, near which that Arcadian king of the prehistoric Rome received the fugitive from Ilion on the Latian coast. It is questionable whether the principal ruin here before us, consisting of a low elevation of stonework, lithoid tufas in enormous square-hewn blocks, which enclose two narrow quadrangular chambers, one much smaller than the other, be the cella of a temple or the chief tower of a fortress. One may be led to decide for the latter, seeing that the edifice is so placed as to command the access to the hill-summit by a very steep approach between walls of

stonework almost alike massive, and of lithoid tufa also, ascending from the valley westward to this high ridge. The structures which fortify this approach have been enclosed, partly in ancient stonework, partly in brick. It appears that the ascent must have been by a staircase, for several blocks of hewn stone, some placed like steps, others turned over, have been found by the removal of soil from this steep pathway. To the left as we look westward rises a clay bank behind the rugged old walls; to the right extends, on a platform, another group of buildings, most curious and heterogeneous, divided into several roofless chambers, and what seems to have been a quadrangular hypaethral court. A frontage between that area and the chambers on the eastern side is formed by three arches of considerable span, built of enormous square-hewn stone blocks, but in great part restored in inferior (though ancient) brickwork; the supporting pilasters and the springings of the arches being almost all of the original and firmer structure that remains. Here, as in other of these last-discovered Palatine ruins, it is evident that violence must have been used, and immense portions of masonry torn off for other buildings—probably for the barbaric castles of mediæval Rome. Most of the constructions on the platform summit, which extends near what I suppose to be the primeval fortress (or is it truly the arx of Evander?), are similar in their stone masonry to the latter edifice; but two of the chambers (roofless like the rest) are of brick with much mortar, similar to that used for the repair of the arches, and probably (to judge from its inferior character) dating from the fourth century. In the interiors we perceive the arrangements for the bath, the calorifers for hot air set into the thickness of partition walls, and a hypocaust, into the cavity of which we may look down, though it is too narrow for us to enter or explore. It is here, amid these bath-chambers, and on the ascent by what seems to have been a lofty staircase, that we see the results of the latest resumed labours on the Palatine. A fine marble basement, apparently for statues, and mutilated epigraphs are the only other antiques recently found on the same site. Great indeed is the contrast between the actual scene on the "Imperial Mount" and what was here presented to view before the purchase of the ground by Napoleon III.—a then wild and solitary region, with the remnants of antiquity half buried under garden soil, half hidden from sight by paltry modern buildings, or more gracefully concealed by the draperies of Nature's weaving—just such, perhaps, as it had been when Goethe wandered about and picked up wrought marble fragments on this Palatine Hill in 1787. On the south-western terraces we now visit the extensive halls and courts of the Flavian palaces, completed by Domitian, long totally concealed, save in a few piles of ruins loftier than the rest; further southward we descend by zig-zag paths into a valley, where the removal of the grass-grown soil has disclosed remains recognisable as the stadium (ascribed to Domitian), with the large basin of a decorative fountain at one end; rich pavements, basements and shafts of granite columns being among the antiques lately exhumed. Above this area, on the south, rises a great hemicycle of brick buildings, divided into two storeys, the upper forming a *loggia* from which the Emperors and their court may have contemplated the games in the stadium or hippodrome. The lower story of this building, probably of the Flavian period, with additions—perhaps the whole upper part—made by Septimius Severus, is divided into three halls with paintings on the higher spaces, and in the lower, remains of panel incrustation in yellow marble (Numidian)—the paintings inferior, the marble decorations most rich. In front, on the level of the stadium, we see the vestiges of a stately colonnade, granite shafts with fine marble capitals. All that is most remarkable in these remains has come to light

within recent years, after being long hidden under garden soil, or thickets and weeds. Here many other objects, formerly concealed, have been brought to light; but the most vast and imposing among the Palatine ruins, with a broad front of vaulted halls, in two storeys, extending along the western acclivity, the latest additions to the imperial residence ascribed to Septimius Severus, stand in sternly picturesque decay, unaltered through any of the excavations which have transformed so much in the regions around. North-eastward we reach the now fully uncovered ruins of buildings evidently more ancient, and in two spacious storeys of halls and smaller chambers, many still roofed over, still adorned with paintings and stucco relief-work. Here are recognised on the ground-floor storey the buildings of Caius Caesar; on the upper those of Nero; though many vaulted halls and gloomy cells of these conspicuous ruins appear, as the ancient brickwork seems to attest, not earlier than the time of Hadrian.

Man's labour has done much on the Palatine Hill within late years; but still it is a spot where silence and solitude usually prevail. Yet the beauty of Nature, spread before us in a magnificent landscape, disputes with the relics of antiquity the claim to our admiration. C. I. HEMANS.

ART SALES.

THIS last week has been remarkably prolific in art sales, among which perhaps the greatest interest has been excited by the dispersion of the accumulated treasures of fifty years of the veteran collector Mr. Henry Bohn. The sale at Christie's lasted four days, consisting only of the English portion of his collection. It realised above 6,500*l*. A Bristol tureen sold for 65*l*., and a sweetmeat stand of three shells with dolphin handle, 40 *gs*. A beautiful miniature of a lady by Skiercliff, a Bristol painter, 34*l*. Battersea enamels sold well, a pair of small vases attributed to Paul Ferg, 24 *gs*.; two pink canisters, from Stowe, 30*l*. An étui, 16*l*. 10*s*.; and a set of card trays, 27½ *gs*. A Plymouth mug sold for 24*l*. 10*s*., and a jug for 19*l*. 10*s*. A pair of Bow figures, Kitty Clive and Woodward, 43*l*., and three rococo vases, 110*l*. Of the Chelsea, a two-handled cup, maroon and gold, 28*l*.; a deep fruit dish with maroon border and peacock centre, 96*l*.; a plate, also maroon and gold, 35*l*., and two deep blue, 71*l*.; a fluted vase, deep blue and gold with medallions, 157*l*. 10*s*.; a pair of vases, crimson and turquoise bands with frieze of dancing figures, 110*l*.; another pair, alternate bands of deep blue and white, 181*l*.; ewer with Watteau subjects, 100*l*. Of the Chelsea figures, the statue of Lord Camden sold for 107*l*.; John Wilkes, 15*l*. 4*s*. 6*d*.; Quin as Falstaff, 24*l*.; shepherdess with hurdy-gurdy, 35*l*.; lion and lioness, 24*l*.; two figures of the Seasons, 32*l*.; two in fancy costumes, 35 *gs*.; two of sportsmen with gun, and female with basket, 60*l*.; a figure of a youth richly dressed, holding a rose, 60*l*.; a pair, Pilgrims of Love, 32*l*.; a Chelsea Derby covered cup and saucer, deep blue, 55*l*.; a pair of Derby peacocks, 24 *gs*.; Lowestoft cup and saucer, 15*l*. 10*s*.; two Worcester tulip-shaped vases with Watteau medallions, 129*l*.; a cup of the Nelson service, 8*l*. 10*s*.; a coffee-cup, 7*l*., and three egg-cups, 7*l*. 15*s*.; two royal plates made for William IV., the one at Rockingham sold for 25½ *gs*., and one at Worcester, 32*l*. 13*s*.

On the 16th inst. Messrs. Christie, Manson and Woods sold, at Manley Hall, Mr. Mendel's collection of engravings after Turner and Sir Joshua Reynolds. The following are some of the prices:—*Cape Column*, 49 *gs*.; and *Mercury and Argus*, 23 *gs*., both engraved by Willmore. *The Shipwreck*, 61*l*.; *The Rivers of England*, a series of sixteen, including the cancelled plates, 76 *gs*.; Illustrations to Campbell's *Poems*, 30 *gs*.; of Sir Walter Scott (62), 60 *gs*.; Turner's *England and Wales*, early proofs, 87 *gs*.; *Richmondshire*, 80 *gs*.;

Liber Studiorum, complete set of the seventy-one engravings, 160 *gs*.; *Basle*, 40 *gs*.; *Windmill and Loch*, 41*l*.; *Inverary Pier*, 61 *gs*.; *Inverary Castle*, 43 *gs*.; *London from Greenwich*, 38 *gs*.; *The Premium Landscape*, etching, 26 *gs*.; *Sheep-washing*, 40*l*.; *Stonehenge*, 40 *gs*.; *The Felucca*, 43*l*.; *The Rainbow*, 40*l*. Of the engravings after Sir Joshua Reynolds, *The Strawberry Girl*, by Watson, sold for 70*l*.; *Lady Catherine Pelham Clinton*, 74 *gs*.; *C. J. Fox, Lady S. Strangways, and Lady Sarah Lennox*, in the garden of Holland House, also by Watson, 66 *gs*.; *Duchess of Ancaster*, by Dixon, 30½ *gs*.; *The Three Graces*, 100 *gs*.; *Duchess of Buccleugh and Lady M. Scott*, 100 *gs*.; *Lady Bamfylde*, 135 *gs*. (these three last all by Watson); *Winter, Lady Caroline Montague*, by Grozer, 110*l*.; *St. Cecilia (Miss Sheridan)*, 60 *gs*.; and *Lady Charles Spencer*, 45*l*., both by Dickinson; *Lady Talbot*, by Valentine Green, 60*l*. The day's sale realised 4,000*l*. Some fine Italian engravings were sold on the following day:—*Lo Spasmo di Sicilia*, after Raffaello, by Toschi, 50 *gs*.; and *The Descent from the Cross*, after D. da Volterra, by the same engraver, 41 *gs*.; *The Marriage of the Virgin*, after Raffaello, 125 *gs*.; *Guido's Aurora*, 80 *gs*.; and L. da Vinci's *Last Supper*, 330 *gs*., both by R. Morghen; *The Belle Jardinière*, 44 *gs*.

On the same day was sold the collection of Wedgwood:—One of the original copies of the Barberini or Portland Vase sold for 189*l*. (181*l*. was the price obtained at Mr. Cother's); a pair of black basalt ewers, *Wine and Water*, 71 *gs*.; a pair of oval plaques, blue jasper with white cameo, a Boar Hunt and Children of Niobe, 121 *gs*.; pair of blue and white jasper ewers, 165 *gs*.; a cabinet containing above 600 plaques, which Mr. Mendel wished to be sold in one lot, fetched 500 *gs*.; an ivory tankard, 110*l*.; four figures of children, the Sciences, 100*l*.; four statuettes of children, emblematic of the Seasons, 180*l*.; *Helen carried off by Paris*, group by Simon Troger, 230 *gs*. On Thursday was sold the sculpture, which produced above 6,000*l*.:—*A Girl with a Kid*, a statue by Wyatt, 350 *gs*.; Gibson, *Venus*, a bust, 85 *gs*.; and his *Wounded Amazon*, exhibited at the International Exhibition of 1862, 610 *gs*.; Spence, *Rebecca at the Well*, 160 *gs*.; R. Ormerod Smith, *Hebe*, 130 *gs*.; the *Gleaner*, 100 *gs*.; I. Lawlor, *Poetry*, 205 *gs*.; Bell, *Babe in the Wood*, 185 *gs*.; Macdonnell, *Eve*, 520 *gs*.; Marshall, *The First Whisper of Love*, 100 *gs*.; Amigoni, *The Dying Spartan*, 215 *gs*.; a pair of Capo di Monte vases enriched with figures in high relief, sold for 271 *gs*.; and a pair of equestrian figures of *Fame*, and *Perseus mounted on Pegasus*, 800 *gs*.

THE well-known collection of Prince Paul Galitzin was sold on the 10th inst. at the Hôtel Drouot. The pictures sold at the following prices: Crome, *On the Yare*, 4,150 fr.; Fyt, *Dog and Cat*, 2,700 fr.; Huysmans of Meehlin, *The Ravine*, 2,000 fr.; Baudouin, *The Indiscreet Wife*, 3,080 fr.; Lépicé, *La Bouillie*, 3,650 fr.; Van Beyeren, *The Scales*, 3,500 fr.; Both, *Summer Evening*, 2,000 fr.; Dusart, *The Old Musician*, 6,000 fr.; Dirk Hals, *Burgomaster of Haarlem and Family*, 1,000 fr.; De Heem, *Still Life*, 4,000 fr.; De Hooch, *Happy Mother*, 4,000 fr.; Van Ravesteyn, *Portrait of a Man*, 2,750 fr., and a *Woman*, 2,750 fr.; Ruysdael, *Winter*, 3,500 fr.; Terburg, *Glass of Lemonade*, 6,700 fr.; Caravaggio, *Portrait of Ariosto*, 1,010 fr.; Tiepolo, *Madonna "au Lys"*, 5,000 fr.; Diaz, *Assumption of the Virgin*, 3,700 fr., and *Dogs in a Wood*, 4,000 fr.; Jules Dupré, *Return of the Flock*, 5,100 fr.; Jongkind, *Dordrecht*, 1,865 fr.; Ziem, *A Bridge at Amsterdam*, 1,820 fr.; Fromentin, *Women of Sakara returning from Drawing Water*, 2,000 fr. Among the decorative objects were:—A drageoir or comit box of tortoiseshell, piqué with gold, 1,400 fr.; wall clock (cartel) period of Louis XV., 3,225 fr.; Renaissance mantelpiece of carved oak, 4,900 fr.; sofa, Louis XIV., 1,500 fr.; small arm chair, Louis XV., 3,705 fr.; four Gobelins tapestries, after compositions of Bérain, 13,805 fr.; and a

portière, Louis XIV., 8,060 fr.; two portières of Gros de Tours, 3,000 fr.; Beauvais panel, signed by Audry, 4,900 fr.; Brussels tapestry, with arms of England, 3,000 fr. The Galitzin collection produced 237,917 fr. (9,516l. 14s.).

NOTES AND NEWS.

A SMALL but interesting collection of miniature portraits, painted, it is affirmed, by the earliest native portrait painters of whom we have any knowledge, Nicholas Hilliard and Isaac and Peter Oliver, has lately been lent to the South Kensington Museum by the Rev. E. T. Edwards, Vicar of Trentham. These portraits formerly formed part of the cabinet of Louis XVI., and were given by him, we are told, to a gentleman of his court who had rendered him a service. After this they came somehow into the possession of the Foreign Office, and were presented by it to the father of the present owner. It is supposed that the miniatures originally belonged to James II., and were acquired at his death by Louis XIV. The first miniature of the series, by Hilliard, represents Mary Queen of Scots, in a rich bodice, over which is thrown a long red chain studded with points, supposed to be in imitation, or meant to serve as a reminder, of the crown of thorns. The second is a portrait of Queen Elizabeth, also attributed to Hilliard. It is executed with much care for detail, but the expression is somewhat wooden. The Queen wears a gold love-knot, supposed, it is stated on the label, to contain a portrait of Essex. Next comes a portrait of James I., and two charming little pictures of the young princes Henry and Charles, the first a handsome youth in armour, and Prince Charles, afterwards Charles I., a pretty boy in a white embroidered tunic and ruff. Another likeness of Prince Henry in Damascene armour is assigned to Isaac Oliver, and by his son Peter Oliver we have portraits of the much tried Princess Elizabeth, wife of the Elector Palatine and Queen of Bohemia, of the unhappy Lady Arabella Stuart, of Henrietta, daughter of Charles I., known in France as *la belle Henriette*, and of Ludwig Philippe, Duke of Simingen, brother of the Elector Palatine. In the same case, but not belonging to the cabinet of Louis XVI., are also two good miniatures of Charles II. and James II. These are ascribed to Petitot, but whether to the elder or the younger painter of that name is not stated.

ONE of our lady-painters, Mrs. Stillman, is a leading exhibitor at the Water-Colour Society in New York. The American journal, *The Nation*, speaks of her works in these terms:—

"The large and remarkable pictures by Mrs. Stillman are almost the only examples present this year of that intellectual subtlety in figure-treatment and that Northern or Gothic ballad-pathos which mark the British school. In one composition, Launcelot is discovered by Elaine, as he dreams by a fountain in his fool's dress, his bauble lying beside him, and the 'pleached bower' of a rose-garden woven above his head; in another, Isoud stands white and ghost-like before Tristram, a lily planted beside her figure, like the symbol of a saint. The pictures are marked by a very perfect observance of unity, the mediæval slenderness of the forms going well with the fashion of the plesance and the orchard in the respective scenes, the quaint formality in which reminds one of missal-work. Deep, pure, and transparent colours are embroidered over the intricate compositions, and fit the drawing like primitive music accompanying antique words. Whatever has been seen of this artist's work is marked by thought and intellectual beauty; her treatment of portraiture, as in the large female head on exhibition, is fascinating in its intensity of comprehension and reserved power."

Other exhibitors mentioned by the same review, not always with commendation, are Messrs. Burling, Fredericks (*Romeo and Juliet*), Matt Morgan, William Magrath (*Wilds of Connemara*), Winslow Homer, Knight, and Eakins, and Mrs. Murray.

THE Munich correspondent of the *Allgemeine*

Zeitung mentions that a notice occurs in a document, now in the Royal Bavarian Archives, which proves that the name of Holbein was to be found as early as the fourteenth century at Augsburg. In the deed in question, which belonged to the Benedictine monastery of SS. Ulrich and Afra, at Augsburg, and bears date November 16, 1312, mention is made of the ground rent due for a piece of meadow-land by a Dame Holbine to "Chunradus de Walshoven quondam tabellio curie." From that time till 1448 no mention of the name is to be met with in any of the tax-books or other known public and official deeds of Augsburg, but after the latter date the name of Holbinne, or Halbin again appears, and it has been conjectured that the family had migrated from Augsburg to Schönefeld between 1312 and 1346, and did not return to the former city till near the middle of the following century.

It has been announced that an Exhibition of works of art will be opened at Dresden in the early part of the summer, which will illustrate the progress of art from the Middle Ages to the middle of the eighteenth century. This exhibition, which is under the immediate patronage of the King and Queen of Saxony and of the Saxon Ministry, will include enamels, cut gems, paintings on glass, ivory, metal casts, terra-cotta, glass, and porcelain, stamped leather, book-bindings, textile fabrics, lace, embroidery, &c. The principal object aimed at in this undertaking is the improvement of industrial art in Saxony, and it thus forms a part of the scheme at present under contemplation by the Government, of providing better technical instruction for the artisan classes, and establishing museums in which perfect specimens of every branch of artistic workmanship will be brought together for inspection by the public. The forthcoming exhibition is under the immediate direction of Professor Hettner and the historical painter, Herr Andrea, besides several architects and manufacturers of standing.

THE *Kölnische Zeitung* states that the German art connoisseurs at Rome speak with commendation of two busts which Professor Joseph Kopf is now exhibiting in his Roman studio, of the German Emperor, who sat to the sculptor last year at Baden Baden, in order that a good likeness might be secured for the marble statue which he had commissioned him to execute. In one the Emperor is represented in all the insignia of imperial power, while in the other he appears in ordinary civic attire. These busts, which are destined for the Royal Academy at Berlin, are executed in marble, and are stated to be remarkable for the success with which the sculptor has combined accurate resemblance to the original with a considerable degree of ideality in the conception and much delicate finish in the technical handling.

THE King of Holland, says the *Chronique*, has bought for 35,000 francs the statue called *Ceinture Dorée* exhibited by M. d'Essinay at the last salon, and, has commissioned that sculptor to execute a pendant to it for the same sum.

AN interesting exhibition and sale, the proceeds of which are to be devoted to French charities in London, is being organised by M^{me}. la Comtesse de Jarnac, and will take place, it is said, early this summer in London. Among the French artists who have promised contributions are M^{ms}. Boulanger, Delaunay, Claude, Gröme, De Nittis, Jobbé-Duval, Manet, Chaplin, Foulonge, Palizzi, Henri Pille, Detaillé, Rapin, Cottin, Dupray, Burgers, Veyrassat, Feyen-Perrin, and the distinguished lady artists M^{mes}. Jacquemart and Henriette Browne. An appeal has also been made to the great French publishing houses, and the firms of Goupil, Hachette, and Plon will be represented by some of the finest engravings and most magnificent volumes that have ever issued from the French press. The splendid collection of the *Histoire Générale de Paris* has also been offered by the Prefect of the Seine.

EIGHT thousand paintings, it is said, have been sent in for admission to the Salon during the past week. Among these are more than the usual number of works of huge dimensions, so that the hanging committee have by no means an easy task before them. The increase in number of large canvases is due, it is supposed, to the fact that the Prix de Salon was gained last year by M. Lehoux's enormous *Martyre de Saint Laurent*.

MR. J. D. CHITTENDEN, who a short time ago executed a most successful bust of Mr. Gladstone, is now engaged upon one of Mr. Disraeli.

AN exhibition of the works of Corot will be opened very soon at the Ecole des Beaux Arts.

THE *Gazette des Beaux-Arts* contains as many as three biographical and critical notices of recently deceased artists this month: three, that is to say, if we reckon Emile Galichon as an artist, and this may justly be done, although he has attained greater distinction as a critic and connoisseur of art. Charles Blanc's estimate of him is that of a warm friend; indeed, the names of Blanc and Galichon are intimately connected in the memories of the readers of the *Gazette des Beaux-Arts* in its earlier and palmier days. The former, it is pleasant to find, now that he is relieved from the cares of state, is returning to his old avocations, but the *Gazette* sustains a loss by the death of its former proprietor and editor that will not easily be filled up. A portrait of Galichon, etched by Léopold Flameng, accompanies the article. The second artist under notice in the number is Charles Gleyre, a painter highly esteemed by the critical few, but very little known to the general public; and the third is the brilliant young Spanish artist Mariano Fortuny, who died so suddenly at Rome last year when at the height of his fame and success. The article upon him, which is to be continued, is by Walther Fol. It is illustrated by several very clever sketches, and an etching by Boilvin of a strange weird picture called *Le Charnour de Serpents*. The other articles of the number are, a learned essay by Charles Blanc on the "Form of Vases," to be continued; a further dissertation on the history of costume, reviewing the Salle de la Renaissance at the late costume exhibition; a descriptive account of the Imperial Treasury (*Schatzkammer*) of Vienna, and a review of Champfleury's *History of Caricature*.

WE are glad to find that the results of Canon Wilmonsky's explorations of Trèves have at length been made public. The expenses connected with the publication of the work have been the cause of the delay in its appearance, as we learn from a recent communication in the *Allgemeine Zeitung*; but, happily, this has now been removed through the combined liberality of the state and the municipality of Trèves. The learned canon's investigations, which were carried on almost unremittingly between 1843 and 1858, have brought to light the interesting fact that three periods of Roman occupation may be traced in three distinct strata of archaeological remains. Each stratum presents its own specific character of masonry and decoration, and in several instances these respective series of Roman workmanship are found superimposed one upon the other. Under the cathedral itself evidences of Roman life have been discovered at a depth of fifteen feet below the level of the surrounding ground, and here have been found walls and floors, painted in the Pompeian style, with wreaths of laurels, aloes, swimming fish, and arabesques of various kinds. No stone mosaics have been discovered in the oldest deposit, and the floors have here been laid down in wooden blocks upon a cement bottom, which has amalgamated together into one general thin brownish layer; while the walls, door-lintels, and other supports have been preserved to a height of three or four feet. At the time of the Roman occupation the bed of the Moselle must have been from eight to ten feet lower than its pre-

sent level, and the oldest settlements of the colonists were situated immediately on the banks of the river. These remains obviously belong to the Flavian age, while the second period of Roman occupation must be referred to the time of Constantine, as is shown by the coins discovered below the beams and rafters of the buildings in this middle stratum. The third and most recent of these architectural series is only about from three to five feet above the second, and shows by the richness of its remains, among which large quantities of mosaics, mural tablets, marbles, polished serpentine and porphyry are found, that the period with which it coincides must have been one of great wealth. This period M. Wilmowsky believes we may with certainty identify with the time of the Emperors Valentinian and Gratian, under whom Trèves had become the local seat of imperial administrative power, and the focus of Roman learning, art, and commerce in Germany. This assumption has now received additional confirmation by the discovery, under the ruins of a building apparently designed for a hall of justice, of a bronze tablet, cast at Lyons, and bearing the bust of Gratian with the inscription DN. GRATIANUS. P. F. AVG. On the obverse the Emperor is represented leaning with his right hand on the shoulder of a youth, and carrying in his left a sceptre with the figure of Victory. Besides the words "Reparatio Reipub." this side of the tablet is marked with the letters L V C, and the imperial cipher.

Canon Wilmowsky's work, which is illustrated with numerous maps and plans, and twenty-six admirably-executed plates, is one of the most interesting contributions to ancient classical and mediæval art that has appeared of late in Germany.

THE STAGE.

Macready's Reminiscences, and Selections from his Diaries and Letters. Edited by Sir Frederick Pollock, Bart. In Two Volumes. (London: Macmillan & Co., 1875.)

THOSE who have any knowledge of what Macready was will hardly need to be told that the two volumes which have just appeared are wholly free from the errors common to many similar works, in which bare and slight and unsuggestive and often ignorant comment takes the place of criticism which should pierce to the truth of things, and in which for all record of character and life we have only petty gossip and rough sketches taken at a distance. Macready's long career must indeed have furnished themes for much valuable remark that is not made here: certain periods are passed over with a slight touch because Macready's own record of them has been bare, and there has been no attempt to fill up from the memories or the letters of others what Macready himself left wanting. In some sense, of course, we are the losers by this; but the principle has been firmly laid down, and strictly kept to. Only Macready speaks. And he speaks first in his reminiscences; next in the long series of his diaries; and lastly in a few letters addressed chiefly to the intimate friend who has edited the book.

So that our loss is a negative loss, and it is of Macready's own infliction. Many of the years of his career in London were filled too busily to allow him to record at any length the social life in which he took part, or that which is more important to the purpose, the story of the stage of that day. Thus it is that he lapses into mere memo-

randa, which at this distance of time have the air of commonplace. And then we read: "May 9th. Madame and Mademoiselle Rachel, Colonel and Mrs. Gurwood, Mrs. Norton, Eastlake, Young, T. Campbell, Kenney, Dr. Elliston and Quin came to dinner;" and "Nov. 23rd. Settled with Marshall and Tomkins the scenery of *The Two Gentlemen of Verona*." But there is not much of this—though the "Diaries" made in middle life are throughout naturally much poorer and less pregnant than the fuller "Reminiscences" of youth, made seemingly in age—and on the whole the book is an excellent chronicle of all that was most interesting in the stage life and stage work of many years. It is a chronicle tinged constantly with strong feeling; full of the appreciation of a mind vigorous and cultivated, and sympathetic too, for whatever was best in dramatic literature and dramatic performance. And we cannot have this chronicle, so pregnant, so full, so revealing as to its author's mind, without having, at the same time, a character. And it is in giving us a great actor's character, as well as the story of a career—and giving that character firmly, definitely, fully—that the main interest of the book will be found to consist, by those at least who in the record of life, want not the petty and chance facts for their own sake, but "incidents in the development of a soul." "Little else"—says the poet of *Sordello*—"little else is worth study."

"Unhappily, a soul does not only "develop"—it sometimes dwindles too. And though no doubt Mr. Macready thought—humbly withal—and many thought with him, that his life of retirement, first at Sherborne and then at Cheltenham, was more desirable than the restless life led in sight of the public of London, one cannot help feeling that he did, in a certain measure, narrow himself down there, however lovably, with his interests in the work that is called "practical"—the village school, the domestic management of the household. He had to care anxiously for his own health. He had had losses—loss of children and wife. And all this told upon him: on his habit of thought, as well as on his outward existence. He kept up some of his old interest in high poetical literature, but not without change. The old artistic life had passed away from him: something of his best self, as an artist, was surely gone.

For the character, then, of Macready, while he was before the public, it is to the record of his youth and middle age that we must look. That was the period of development. His faults were faults of impulsiveness. Into pettiness of feeling and action he was very rarely surprised. But he was always regretting his quickly roused anger, and the sensitiveness and the excitability which were his strength as well as his weakness. Want of appreciation he had not often to complain of; but when he noticed it, it irritated him. "Acted *Money* very well," he writes on one occasion, "to a very dull audience. Was very angry." And now and again there are entries regretting his irritability: his want of self-control in the small things of life.

Born in Mary Street, Tottenham Court

Road, in March, 1793—and the son of an actor and manager—he went from preparatory schools to Rugby, which he had to leave early, owing to his father's difficulties. His first appearance on the stage was in the character of Romeo, and this took place at Birmingham, when he was but seventeen. He rapidly acquired country reputation, and hesitated as to acting in London, where Kean and the Kembles and Young held the great places of the stage; but having finally decided to make the experiment, he appeared at Covent Garden in September, 1816, as Orestes—with good success—and three years later his performance of Richard the Third set him at the head of his profession. Between these two events he had had grave thoughts of abandoning the stage for the profession of the Church. The scale was only turned by his wishing to borrow money to lend to his brother—that his brother might be replaced in his old regiment—and this money, which Macready succeeded in borrowing, could only be repaid by his own earnings at the theatre.

Long before his marriage he was a famous man; and his engagement to Miss Catherine Atkins, who was a very young provincial actress of no note, was not very welcome to his friends. There is an amusing account of how he introduced his sweetheart to his sister, and how evident was the sister's surprise and disappointment. Catherine was chagrined, and the sister laid up for the rest of the day—it reads like a page out of domestic comedy. But Macready's own feeling for Catherine was always tender and poetical, from the morning when he saw her walking on the stage at Dundee, waiting for a rehearsal not yet begun. She played Virginia, to his Virginius, in the tragedy of Sheridan Knowles. But let us hear him on the subject:—

"She was distinguishable for a peculiar expression of intelligence and sprightly gentleness. She rehearsed with great propriety the part of the Prince of Wales, and was introduced to me by the manager as my Virginia for the next night's play. On the following morning she came an hour before the regular summons to go through the scenes of Virginia and receive my instructions. She was dressed in a closely-fitting tartan frock, which showed off to advantage the perfect symmetry of her sylph-like figure. . . . She might have been Virginia."

He says this quite simply. He hardly knows that he is praising her. The sentence slips out accidentally, with many others. But, "she might have been Virginia." It was that that settled it, whether he knew it or no. And long afterwards he is found declaring that his Virginia had never disappointed him. And from the triumph of the stage, in later days—as Richard, Hamlet, Iago, Henry the Fourth, Evelyn, Richelieu, Strafford—he was glad to turn to the quiet of his country house and its family party: "Catherine and the children" were loves to which he was always true. Some artists find their truest rest in the pursuit of their art; but in this Macready seemed to find no rest at all, but at most, only a fierce satisfaction which lessened as time went on. That point in his character and temperament is certainly to be noted. He was happier at home, in a quietness,

which he did not feel to be the quietness of stagnation.

Yet no one can read his reminiscences without perceiving how genuine was his appreciation of the art of the theatre; how intelligent his judgment on his great contemporaries. He was decided in preferring Talma to Kemble; Talma, he said, was on occasion quite as nobly statuesque as Philip John, and at the same time more natural. Kemble declaimed his part—Talma lived in it. Miss O'Neill was the most perfect Juliet of his experience. She entirely realised his conception of the character. He was for awhile a somewhat jealous rival of Young's, but he always respected him. Rachel he was disappointed with. She lacked, not indeed intensity in passion, but exaltation in passion; and for this he went back to his memory of Miss O'Neill, as he might have gone forward to his sight of Ristori.

During his professional career Macready was ever studiously occupied with the thought of his characters. The first time he had to represent madness, he went to a lunatic asylum, and made his painful observations, not at all in the spirit of a medical student engaged in vivisection, but with reluctance, and even with fear. Two rooms were all that he could manage. Then he turned back. And in the night he woke with nervous horror, remembering everything that he had seen, and praying that he might never himself be bereft of his reason. Long afterwards, he went again. That was when he was studying Lear. But even then, Bedlam was too dreadful a sight for a man of his sensitive nature and quick imagination. He was too nervous to go on, as he confesses in his diary. He played Lear very unequally. At Swansea, in 1833, he reports himself ill satisfied after five hours of rehearsal. Then came the performance itself—"a crude, fictitious voice, no point—in short, a failure. To succeed, I must strain every nerve of thought." A day or two later, walking, at night, about the streets of Gloucester, "I perceived clearly my want of directness, reality, and truth, in Lear." At Cardiff, in the coach, "thought a little on Lear." At Leeds, "applied myself to the consideration of Lear." Afterwards, "walked from Knaresborough to Harrogate, thinking of Lear." And so it was that unremitting work made him an artist—among the last of our great ones.

But we stop here. That *Macready's Reminiscences* abound in valuable criticism and interesting record—besides, but not above, this picture of personal life and character—has already been indicated. By reason chiefly of its earlier and least fragmentary portions, this is a book that will live.

FREDERICK WEDMORE.

STAGE NOTES.

Nicholas Nickleby, or as much of it as can conveniently be put into a single drama, was produced at the Adelphi Theatre on Saturday night, with all the signs of success. Dickens's earlier heroes were not very interesting, and his earlier plots were not very well constructed, though they were often more than sufficiently complicated. In both points, he improved as he went on, until at last in *The Mystery of Edwin Drood* he gave us, in addi-

tion to the thousand other charms of an inexhaustible genius, a good plot and an interesting young man. The story of *Nicholas Nickleby* goes, so to say, on many lines, and it is round the episode of Smike that Mr. Halliday has clustered the persons and scenes of his play. He has introduced a good deal of dialogue not to be found in Dickens, and the sequence of scenes he has necessarily altered; and the relationship of Smike to Mr. Ralph Nickleby may be guessed at early in his work. The Crumles family have no place in the play; we do not make the acquaintance of Mr. Mantalini; and even Mrs. Nickleby herself—who perhaps never quite succeeded, in the book, in being all she was meant to be—is little better than a shadow. On the other hand, much prominence is given to Newman Noggs, and some to Brooker—whom Mr. Shore does not make less melodramatic than the novelist has made him—and to Squeers and Mrs. Squeers, Miss Squeers, Tilda Price and John Browdie much room is naturally assigned. Mr. Halliday has not, we think, had as good material to work upon as when he undertook to dramatise *David Copperfield* and *Dombey*. It is true that he made of *Dombey* almost two distinct plays in one evening's entertainment, but both had interest, and one gave occasion for the most artistic display of humble and peculiar life that the stage had witnessed for a very long time. In presenting in his version of *Nickleby* one connected story, his work has both gained and lost. But as regards this particular novel the gain is greater than the loss. That *Nickleby* would on the whole be well acted appeared pretty certain from the list of strong names in the programme. But the owners of one or two of the strong names do not fit their parts quite as well as they are accustomed to. Mrs. Alfred Mellon has been seen to far greater advantage than in the character of Mrs. Squeers, though she appears to realize what most of the audience desire to have presented them. Mr. John Clarke as Squeers brings humour and experience to his task, acting, as usual, with alertness and energy; but his luscious voice and genial utterance are perhaps out of keeping with the presentation of Squeers, who was probably a more morose rogue. Mr. Emery looks John Browdie to the life, and acts throughout the tea party with the nervousness of a big shy man who is afraid of nothing in the world except women. But John Browdie's part is noticeable for little beside geniality of nature, and though Mr. Emery has presented us with few more accurate portraits, he has given us more interesting and more touching work. Mr. Fernandez makes up well as Ralph Nickleby, and Mr. C. J. Smith—a veteran at the Adelphi—gives us a good picture, a bit of the true Dickens, in his lachrymose Snawley. Nicholas Nickleby himself is represented with some grace and youthfulness of feeling by Mr. Terriss. Newman Noggs is forcibly played by Mr. Belmore. The gait of the besotted servant—once a gentleman—is excellent. Notice the half-paralysed hands: a detail true, though repulsive. But of the softer elements in Newman Noggs' character Mr. Belmore is not so complete an exponent. Poor Smike is acted by a lady—Miss Lydia Foote. She does not seize the imbecility of the boy, but gives a sufficiently touching picture of the wrongs he suffers, and has a death-scene not without effect. As Mrs. Nickleby Mrs. Addie is poor. Miss Edith Stuart appears as Kate. Miss Harriet Coveney is good in the beginning of her representation of Miss Squeers, and Miss Hudspeth is set down for Tilda Price.

MANY readers will have heard with surprise and regret of the death of Mr. H. L. Bateman, who for the last three or four years has been the lessee and manager of the Lyceum Theatre. Mr. Bateman died suddenly on Monday evening, at his house in Rutland Gardens. For very many years he had been engaged in theatrical and operatic enterprises, always prosecuted by him with energy, tact, and shrewdness; but no enterprise had been

more creditable to him than his last, by which he had sought to restore the poetical drama to some lasting home on the English stage, and in so doing to give room for the fit display of the abilities of a wholly remarkable actor—Mr. Irving. The Lyceum Theatre has been closed during the week; but it will reopen on Monday, when the performances of *Hamlet* will be resumed.

THURSDAY next, it will be observed, is fixed for the first appearance of the Italian tragedian, Signor Salvini, at Drury Lane Theatre.

A NEW *bouffonnerie* is to be played immediately at the Strand, in place of Mr. Farnie's *Zoo*, and we hear that they are also rehearsing a new comic drama by Mr. Byron, which in due time will take the place of *Old Sailors*.

THE Opéra Comique, in the Strand, reopens on Monday for a season of French plays. Sardou's *Famille Benoiton* will be performed, with Mdlle. Andrée Kelly in the cast.

A REVIVAL of the *Ticket of Leave Man*, it is now announced, will follow *Two Orphans* at the Olympic.

DURING the week *Money* has been acted at the Gaiety Theatre, where *Rose Michel*, with the new cast which we announced last week, will take its place to-night.

MISS LITTON and her company return from the East End to the West End, on Monday evening, appearing for the first time at the Saint James's Theatre, where the Pit, which was lately banished, has wisely been restored.

THE *Nation* is outspoken in its criticism of Mrs. Rousby, who has just been playing at New York. "Her acting," it says, "is absolutely flat and weak—uninspired, untrained, unfinished. It was singular to see so extremely pretty a person take so little the critical chill off the atmosphere. Mrs. Rousby is distinctly incompetent." But the *Nation* is not the first paper that has told Mrs. Rousby that she has her art to learn.

MANY will be surprised to learn that the *Société des Auteurs et Compositeurs dramatiques*, founded by Scribe in 1829, has now 749 members. Of these only seventeen are ladies.

Les Ingrats, by M. Jules Claretie, is the last new production at the Théâtre de Cluny.

THE death is announced of Mdlle. Ancelot, who wrote many pieces for the Paris stage. The *Mariage Raisonnable* was her first piece, at the Théâtre Français; and she afterwards wrote for the Variétés and other theatres. Her daughter married Maître Lachaud, the famous advocate.

MUSIC.

MONDAY POPULAR CONCERTS.

THE seventeenth season of these concerts was brought to a close last Monday, the director's benefit taking place on that evening. As usual on this occasion, Mr. Chappell brought together a large number of the artists who through the past season have taken a prominent part in the concerts; and the programme, though consisting for the most part of well-established favourites, was, perhaps partly for that very reason, sufficient to crowd St. James's Hall to the doors. As a representative programme, that of Monday night is worth giving in its entirety. It commenced with Beethoven's quintett in C, Op. 29, played by Messrs. Joachim, L. Ries, Straus, Zerbini, and Piatti. Mdlle. Sophie Löwe then sang two songs by Schumann ("Waldegespräch" and "Frühlingsnacht"), after which Mendelssohn's well-known variations in D for piano and violoncello were given by Mdlle. Krebs and Signor Piatti. Two movements from Spohr's Duet in D for two violins (Op. 67, No. 2) succeeded, the performers being Mdlle. Norman-Néruda and Herr Joachim. After Miss Antoinette Sterling had brought forward Schubert's two songs "Der Lindenbaum"

and "Der Tod und das Mädchen," the first part concluded with Beethoven's Sonata in G, for piano and violin (Op. 30, No. 3), played by Dr. Bülow and Herr Joachim.

The second part of the concert comprised the Andante with variations for piano and violin forming the second movement of Mozart's Sonata in F for those instruments, which on the present occasion fell to the share of Mr. Charles Hallé and Mme. Norman-Néruda; Chopin's song "Polen's Grabgesang;" (Miss Antoinette Sterling); three of Brahms's "Hungarian Dances" arranged for violin and piano by Herr Joachim, and performed by that gentleman and Dr. Bülow, one being encored; and, lastly, Bach's Triple Concerto in D minor for three pianos with double quartett accompaniments, the three pianists being Mdle. Krebs, Dr. Bülow and Mr. Charles Hallé, and the accompaniments being sustained by Messrs. Joachim, L. Ries, Pollitzer, Wiener, Straus, Zerbini, Piatti, Daubert, and Reynolds. With such artists as those enumerated any detailed criticism of the performance becomes altogether superfluous. It will be more to the purpose, as well as more interesting, to attempt a slight review of the season which on Monday was brought to such a successful close.

There can be little doubt that Mr. Chappell has had, so to speak, to make his own public. When the Monday Popular Concerts were commenced in 1869, our concert-goers could be attracted only by well-known names, and not always by them. A "Beethoven night" or a "Mendelssohn night" might be counted on as a probable success; but at that time the announcement of a new work by Brahms or Raff would certainly not have been expected to bring together a large audience. Mr. Chappell, however, by sheer perseverance, has educated his hearers till they are capable not merely of enjoying but of appreciating good music whencesoever it may come. There is probably no more discriminating audience, whether as regards the merit of the music or of the performance, than that which assembles on a Monday in St. James's Hall. Were it otherwise, the director would hardly have ventured to produce so many new and unknown works as he has done during the past season. Among the novelties, or almost novelties, brought forward, have been Beethoven's Variations, Op. 121, for piano, violin and violoncello; Spohr's Third Trio (in A minor, Op. 124) and his piano Quintett in D minor, Op. 130; Schumann's Toccata in C, "Faschingsschwank aus Wien," Fantasiestücke, Op. 88, and Sonata in D minor for piano and violin; Schubert's Fantasia in C, Op. 159, for the same instruments; Chopin's Sonata in G minor, Op. 65, for piano and violoncello; Brahms's Sextett in B flat (Op. 18), his piano Quartett in A, and his piano Quintett in F minor; Raff's Suite for piano in E minor, and Sonata in D for piano and violin; Rubinstein's Trio in B flat, Grieg's Sonata in F for piano and violin, Gernsheim's Trio in F, and Rheinberger's piano Quartett in E flat. Besides these works, Bennett's Chamber Trio in A, and his Sonata "The Maid of Orleans" were given at a memorial concert; and on every evening the programme has included some of those old-established favourites which can scarcely be heard too often. Mr. Chappell may well be proud of such a retrospect as that of the season now ended, which is not only most honourable in itself, but which affords well-grounded reason to hope that the course which he has adopted of bringing out of his treasury things new as well as old will be adhered to in future seasons.

EBENEZER PROUT.

A GENUINE treat was afforded to musicians at the Crystal Palace last Saturday by a particularly fine performance of Schumann's symphony in D minor. This remarkable work has been repeatedly produced at these concerts—the one in question being its eleventh performance there—but has, strange to say, seldom if ever been heard elsewhere in this country. That it is one of Schu-

mann's finest and most finished works can, perhaps, hardly be affirmed; that it is one of his most individual may safely be maintained. With the exception of the second subject of the finale, which was (no doubt unconsciously) suggested by a theme from Beethoven's symphony in D, the ideas are throughout most original; and the treatment is no less so. The work is the first example of a symphony "in one movement," as the author himself describes it on his title-page; the four, or rather five, divisions of the piece having not merely that external connexion which arises from their following one another continuously and without break in performance, but that deeper internal unity resulting from the employment of the same subjects in different parts of the work—the theme of the introduction recurring in the "Romance," while the principal subject of the finale is founded on an important episode of the first allegro. May not this symphony have suggested to Liszt the form which he has adopted, and so largely extended, in his "Symphonische Dichtungen," of using the same leading subjects ("Leitmotive") in variously metamorphosed forms throughout the different parts of his compositions? With respect to the performance of the symphony, we can but repeat the phrases which it is useful to employ nearly every week—it was simply the perfection of symphony-playing. The remaining orchestral pieces of this concert were Hiller's "Dramatic Fantasia" (Op. 157), an interesting and scholarly work which was written for the opening of the new theatre at Cologne in 1872, and first performed at the Crystal Palace in the following March, and Weber's overture to *Euryanthe*. The solo instrumentalist was Mme. Norman-Néruda, who brought forward Viotti's concerto for violin in A minor (No. 22), which she played with her well-known purity of tone and delicacy of style. The work itself is of chiefly historical interest, being of course, like nearly all the older Italian music, not destitute of melody, but somewhat old-fashioned, and, as a whole, dull. The vocalists were Mme. Lemmens-Sherrington, who sang Auber's brilliant "Ah quelle nuit!" from *Le Domino Noir*, and Beethoven's "Kennst du das Land," and Miss Antoinette Sterling, who, whether from a misunderstanding with her accompanist, or from some other unexplained cause, had to "try back" twice with her first song (one by Blumenthal) with an effect more novel than agreeable. This afternoon Bach's great cantata "Ich hatte viel Bekümmernis" (one of his noblest works), is to be performed at these concerts for the first time in England.

As we are obliged this week to go to press on an earlier day than usual, we are prevented from giving, as we had intended, an account of the Passion week performances of Bach's *Passion according to Matthew*, under Mr. Barnby, at the Royal Albert Hall. It is a gratifying sign of the progress towards popularity which Bach's masterpiece is rapidly making in this country that the directors of these concerts should have been encouraged to repeat the experiment of last year, and to perform this great work three times in one week.

MR. MAPLESON has issued his prospectus for the coming season of Her Majesty's Opera, Drury Lane, the opening night of which is fixed for the 10th proximo. His list of artistes includes, besides most of the members of the company last season, the new names of Mdles. Varesi and Pernini, and of Signori Bignardi and Panzetta. Far more interesting, however, than the mere recital of names is the list of promises, which for the sake of art it is much to be hoped may not result in a mere paving of the nether regions. The intended production of *Lohengrin* has been already announced in the ACADEMY, and the complete cast which Mr. Mapleson now gives is as follows: Elsa, Mme. Christine Nilsson; Ortrud, Mdle. Titiens; Lohengrin, Signor Campanini;

Telramund, Signor Galassi; King Henry, Herr Behrens; and Herald, Signor Costa. That Sir Michael Costa will do his utmost to secure a fine performance no one will for a moment doubt; it is only earnestly to be hoped that the spirit may not move him to retouch Wagner's masterly orchestration. Hardly less welcome than the promise of *Lohengrin* is the announced revival of Cherubini's *Medea*, with Mdle. Titiens as the heroine, a part she has made completely her own. Balfé's *Takismano*, as might be expected, again occupies a prominent place in the programme, and a new opera, *Gli Amanti di Verona*, composed by the Marquis d'Ivry, in which Mme. Nilsson will sustain the principal character, is also in the list of novelties. Best of all however, for true lovers of music is Mr. Mapleson's intimation that in order to meet the increasing taste for works of the highest artistic value, one evening in each week will, as an experiment, be devoted to classical opera. Among works of this class named in the prospectus we find, besides the *Medea* already mentioned, *Fidelio*, *Der Freischütz*, *Il Flauto Magico*, *Don Giovanni*, and *Figaro*. We sincerely hope that the result of the "experiment" may be sufficiently favourable to warrant its continuance; but remembering the sad fate of *Les Deux Journées* in 1872, and the present state of operatic fashion, it is impossible to feel very sanguine. The frequenters of the opera mostly go there not to hear good music, but to listen to their favourite singers. It will be indeed a happy result if Mr. Mapleson's venture should succeed in raising their taste to the required standard.

THE prize for the composition of the best string quartett, offered last year by the Société des Beaux Arts of Caen, has been awarded to M. Alex. Luigini, of Lyons, who last year obtained a similar distinction for a string quartett at Paris.

THE German Government intend, according to the *Allgemeine Zeitung*, to build a new quarter in Berlin, in which all the streets and squares will be named in honour of great composers and musicians, as has already been done in the case of artists.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Ecclesiastical Architecture of Ireland to the close of the Twelfth Century, &c. With 54 Plates. By Richard Rolt Brash, Architect, M.R.I.A., F.S.A.Scot., Fellow of the Royal Historical and Archaeological Association of Ireland. 4to. (Dublin: Kelly. London: Simpkin, Marshall & Co., 1875.)

SINCE Petrie gave to the public his (alas!) unfinished work on the Ecclesiastical Architecture of Ireland previous to the Anglo-Norman Invasion, the work which heads this article is the most important and valuable contribution to an interesting and almost unexplored branch of knowledge. When, however, we bracket these works together, and indicate the value of Mr. Brash's volume, we are far from wishing to dethrone Petrie from his well-earned pre-eminence. However meritoriously Mr. Brash may follow in the track of his predecessor, yet, *hæud passibus æquis* must bethe verdict; and that it should be so is not a disparagement to Petrie's follower. Petrie, as was almost inevitable to the explorer of paths totally untrodden, has made mistakes, and of these the greatest was the assignment of too early a date to the specimens of Irish church architecture which he illustrated so well. That Petrie was convinced of this himself is certain; and it is a sad truth that the necessity of retracting his error was a task he shrank from, and although he had prepared the illustrations and was familiar with the matter necessary for the completion of his second volume, yet it never saw the light; while by a strange nemesis his glorious woodcuts, drawn lovingly on the block in his unequalled style, and no less lovingly and beautifully engraved under his own eye, were sold by his publishers, after his death, to pay the expenses incurred, and now go to form the illustrations in the book which ventilates Mr. Marcus Keane's "Cuthite" theory, and converts the saints of Ireland into demons and idols!

Mr. Brash may object to Petrie that the work of the latter was written with a foregone conclusion; but at least Petrie is not open to the charge of writing an essay on the Architecture of Ireland which avowedly leaves out of its field the Round Towers of that country. And it cannot but be held a blot in Mr. Brash's work, that let these remarkable structures be what they may (and Mr. Brash openly and honestly avows his belief that they are not of Christian origin*),

* Mr Brash says, when speaking of the lesser round tower at Clonmacnois, "much ado has been made about

they should, as a class, be left out of a treatise on ecclesiastical architecture which very properly arrays examples of the masonry of avowedly pre-Christian *cashels* and *crypts* among the facts by which it is conclusively proved that Irish builders constructed stone edifices, and were available for their erection, when Christianity was introduced early in the fifth century. It certainly looks like an instinctive shrinking from the truth of the Pagan theory of the towers, when a writer of Mr. Brash's known proclivities on the question, although he describes a few of them incidentally, has omitted to cite them as triumphant proofs that cemented and tool-dressed masonry was known to the Pagan Gaels.

But to return to the work before us. The author's plan first leads him to treat of confessedly pre-historic structures, into the constructive features of which masonry enters; the proofs of this must be looked for, curiously enough, at both the commencement and conclusion of the work; while last of all he gives an interesting account of the great traditional builder of the Irish—the Goban Saer. All the examples of this class are devoid of cement of any kind; in most instances, as in the walls of the crypts, or souterrains, of earthen *raths*, they consist of rough unjointed masonry; but he gives some examples of the fine jointing or joggling of the stones one into another, which are very remarkable. He then passes on to the earliest Oratories, and proves their connexion with the buildings of the pre-Christian period in this last-mentioned feature, the sole improvement being the use of mortar. These early oratories he divides into two classes: the first devoid of ornament, of small size and quasi-cyclopean masonry, the doors square-headed, with inclined jambs; the vaults with which they were covered not being true arches, but formed on the same principle as the bee-hive vaulted crypts, and *cloghans* or stone-roofed huts: some of these buildings, he thinks, may date from the early part of the sixth century. The second class he defines as exhibiting an advance in the use of the arch, and the introduction of simple mouldings. Then came a time of progress, however slow, commencing with the eighth century, which Mr. Brash divides into a First and Second Transition Period.

"We have thus," he says, "arrived at a period when we can observe a decided change in Irish church building; the old forms derived from a Pagan age came to be disused, and forms prevalent in the Christian architecture of other countries began to be adopted, though national peculiarities are apparent."

The commencement of this change Mr. Brash proposes to correlate with the com-

the finding of an iron hinge pivot or pivots in the window jambs, as limiting the age of the tower." An observation of this kind will not obviate the fact that iron hinge pivots, in excellent preservation, still exist in the window jambs, and from the mode of their insertion could not possibly have been introduced after the tower was built. Mr. Brash, indeed, allows that the date of this tower may have been within the Christian era; but what does he say to the existence of hinges in the doorways of some of the most ancient towers we have, as, for example, those of St. Canice and Fertagh, in the county of Kilkenny? This is not a question of the date of the use of iron in Ireland, but it bears strongly against the pre-historic theory of the towers, as it is quite impossible for iron exposed to the air to last for an indefinite number of centuries in the damp climate of Ireland.

mencement of the eleventh century. At this point our author breaks off, and devotes his sixth chapter to an enquiry as to the origin of early Irish art, which he professes to trace from the rude stone carvings—the spirals and chevrons—of the burial mounds of the Lough Crew Hills and the sepulchral chamber of New Grange on the Boyne:—

"In these rock sculptures, then, we see most undoubtedly the germs of that art for which the Irish in subsequent ages became so famous. These forms can be traced downwards in the illumination of manuscripts, upon grave slabs, and on the monumental crosses."

That Byzantine art, however, influenced this development Mr. Brash acknowledges, and he attributes this influence to the close connexion that existed between the Irish Church and Eastern Christianity. When, therefore, he heads his seventh chapter with the title "The Romanesque Period," it is to be presumed that he means Eastern Romanesque.

The architecture of the twelfth century in Ireland receives a large share of Mr. Brash's attention. Our space forbids us to enter fully on his descriptions of the many beautiful examples of Irish church architecture which this period affords: he describes, among others, the porch of Clonfert Cathedral, the doorway of Kells church, the chancel arches of Monaincha, and of the Nun's church, Clonmacnois, and the ancient Cathedral of Cashel, now called Cormac's chapel; and is the first to call attention in the croft or upper chamber of the last-mentioned building to the existence of a *pointed arch* in the vaulting, dating from the earlier half of the twelfth century.

The last phase of Irish church architecture to which Mr. Brash refers, is that which came into fashion with the introduction of the Cistercian order about the middle of the twelfth century. He considers Cormac's chapel to have been probably the last church of any importance erected in Ireland whose arrangement, construction, and details were in accordance with the traditions of native architecture. To St. Malachi O'Morgair's intimacy with St. Bernard he thinks we owe the introduction of a new style. On his way home from Rome as Apostolic Legate for all Ireland, he visited St. Bernard at Clairvaux, by whom he was persuaded to introduce the Cistercian order of monks into Ireland; and the postulants whom he sent for instruction to St. Bernard having returned, accompanied by some Gaulish monks, they were established in the place now called Mellifont, in the county of Louth, A.D. 1142. There is a decidedly Gallic tendency in the details of the small portion of the original buildings of Mellifont which has come down to us, and which perhaps is due to the presence of the foreign monks who accompanied the Irish postulants on their return from France; but although the lightness and beauty apparent in the style of the so-called baptistry* of Mellifont may be

* Although Mr. Brash has come to the conclusion that this octagonal building pierced with richly moulded openings on each of its eight faces is a baptistry, it does not seem certain that it was so. baptistries were not usually adjuncts to monastic houses. The polygonal chapter houses attached to Wells and Salisbury would seem to tell strongly in

traced elsewhere, it does not appear to have influenced all the early Cistercian church builders. Jerpoint and Baltinglas show no trace of it, and may be pronounced Anglo-Norman; and in a few years later we find the Cistercian builders using the pure First Pointed, or Early English style.

To the elucidation of this style and its developments Mr. Brash promises to return, and we wish him all success in his labours.

That this work is a valuable contribution to the study of a little-known subject we gladly acknowledge; its defects of arrangement are indeed considerable, but they are such as necessarily resulted from the serial form of its original appearance in the pages of the *Irish Builder*. Should it reach a second edition, which we trust may be the case, its author will no doubt reduce some of the chapters to their proper places, and it is to be hoped that many of the illustrations will be improved. The details of the glorious doorway of Kells Church, for example, give no real knowledge of the sculptures they profess to represent, and the examples of early Christian masonry which illustrate the eleventh chapter afford but a poor idea of the originals. Many of the plates are, however, admirably executed, and the volume does great credit to the enterprising Dublin publishers by whom it is brought out.

JAMES GRAVES.

The Chinese Reader's Manual: a Handbook of Biographical, Historical, Mythological, and General Literary Reference. By William Frederick Mayers, Chinese Secretary to the British Legation at Peking. (Shanghai: Presbyterian Mission Press. London: Trübner & Co., 1874.)

EUROPEAN students of Chinese will find their labour much lightened by the use of this book, which opens up to view Chinese biography, history, and mythology in a manner clear, brief, and trustworthy.

Its publication is another step towards rendering accessible to Englishmen the treasures of Chinese literature. It gives a brief account of all the celebrated characters in the past of that people.

Yao and Shun at the dawn of history, B.C. 2357, and 2258, are the two models of imperial wisdom to whom the scholars and people of China have ever since looked up with reverence. They were followed by the three founders of the Hsia, Shang, and Chow dynasties, Yü, T'ang and Si peh, all of whom were celebrated as wise kings.

These, with Chow Kung and Confucius, who died B.C. 1105 and B.C. 479 respectively, constitute the sages to whom the men of later times have ascribed the origin of the national polity, and the moral and social system, and the brightest intuition of the good and true ever given to mankind.

With them in the old days were connected a cloud of other personages, some historical, and some legendary. Among them Fuhhi, who dates 500 years earlier than Yao, taught his countrymen hunting, fishing and pasturage, together with writing and music.

An account is given in alphabetical order

favour of this building having been erected for a similar purpose.

in Mr. Mayers' first part of all such personages. But among the 974 articles, biographical, archaeological, and mythological, the most are modern. During 4,000 years of history, and a long antecedent period of fable, the number of distinguished names is inevitably great. Only a part are included in the 292 pages devoted to this subject. But it will be found that so many of the most noteworthy names are included that the book cannot fail to become a *vade mecum* with Chinese students.

History has been in China, as in Greece and Rome, in great part biographical. In all the Chinese histories from the time of Sze ma t'sien biography has been the form in which most of the history has been taught. That this eminent man should be called by his countrymen, by way of distinction, "the great historian," and that his work should consist mainly of biography, is a suggestive fact. He has been called the Herodotus of China, but he is in this respect more like its Plutarch. The Chinese mind is more concentrative than reflective. Their idea of history is complete when they have an annual chronicle, a biography of distinguished persons, and an account of the administration of government. Hence in this little book a continuous history of China can be picked out with ease, because in the native biographies from which they are translated the history is already in that form.

The Chinese, through the action of their conservative spirit, like to keep with care every ancient story, however wildly monstrous, if written or transmitted by a noted man. They know that legends are valuable as relics of old times. To us they are still more valuable as illustrative of the ancient religion and modes of thinking of the people. Here we find many of them. A great interest attaches to tales of loyalty and filial piety, as exemplifying the action of the moral nature in men. They abound in Chinese literature, and Mr. Mayers has made a selection of them. Then there are literary women from Pan chao, who completed her brother Pan ku's celebrated history after his death in the first century of the Christian era, downwards. There are the poets, such as Li-tai-pe, said to be the planet Venus in human shape, and Tufu whom some think a better poet than Li-tai-pe, though he did not pass through so many romantic adventures. These men lived in the eighth century. Their influence on the later literature of China has been most remarkable. By the law of the land every aspirant to civil office must be a poet before he can pass the examinations. If he cannot make verses in the metres of the eighth century he will not be allowed to become a magistrate. There are the alchemists who flourished in the two centuries before and the three centuries after the Christian era, an interesting class of men who worked on the edge of scientific discovery and failed to grasp truth because they were misled by bad theories.* There are the Taoists, of whom the alchemists form a section. Some of them rise to the dignity of philosophers. Others were slavish

* Mr. Mayers gives it as his opinion (p. 202) that it is probable that the Arabs derived alchemy from a Chinese source, as first suggested by the writer of this review nineteen years ago.

copyists of the translated Hindú literature and mythology. Others were men whom legend loves to surround with fantastic fables, and who are thought much more of by posterity than by their contemporaries. The critics of the classical books are a numerous school, if not rather three schools, viz., the Han B.C. 200 to A.D. 200, the Sung A.D. 1000 to 1200, and that of the present dynasty A.D. 1644 to the present time. The military writers, the warriors, the statesmen, the rebel chiefs of all dynasties, find in this book a brief record, and deserve to have made known in Europe at least a few dates and facts to introduce them.

The philosophers also have a few facts given respecting them, but there is not in this work any full critical estimate of the development of Chinese philosophy. Yet the history of Chinese philosophy is most instructive. The Chinese began with the numerical philosophy, which arranged all the objects of thought and the elements of the ancient civilisation in numerical categories, many of which are given by our author in his second part. In the age of Confucius and Mencius there was a conflict of systems. The orthodox was moral and intuitive. The heterodox, as in the instance of Lao tsze, sought purity in rest, or, as in Chwang tsze, proceeded to identify man with the universe. In Yang chu heterodoxy was bold enough to maintain that self-gratification should be the ground of human action. In Siün K'wang the moral sense in man was traced to education. In Meh ti undistinguishing love to all was upheld as the true morality.

About the beginning of the Christian era the orthodox system and that of Laou tsze were the two most in favour. The students of the Classics ranged themselves under the banner of Confucius. The alchemists revered Laou-tsze as their founder. Some tried to combine two opposite systems, as Yang Hiung, who taught that human nature is originally both good and evil. There seems to be a little inaccuracy in our author's account of this philosopher, when, after stating this fact, he adds that he contended that human character in the individual depends wholly on education, and is not in any sense innate.

The spread of Buddhism after the Han dynasty had the effect of silencing the voice of philosophy till the days of Han-yü in the eighth and ninth centuries. In regard to the moral nature of man, he maintained that human nature is divided into three classes, the innately good, the innately bad, and that which is both good and bad. He was a determined foe of Buddhism. In the Sung period the Confucian philosophy took heart again, and for two centuries a brilliant series of great names adorned the literary annals of the time. These men, among whom the greatest was Chu-hi, attempted to restore orthodoxy, but they lacked the critical spirit, and were too much tied by system. They gained great influence, and the nation chose to adopt their views. For the narrowness of the Chinese mind since that time these philosophers are to a large extent responsible. The superficial character of their system of nature, the dulness of their thinking, and the fact that they were

satisfied with the principle that all things originated in the Great Extreme and with the map which usually accompanies it, are not very creditable to them. After becoming acquainted with Hindú idealism, they might have elaborated something more aspiring.

If our author could have devoted more space to this subject, it would have been perhaps desirable.

In Buddhism he has omitted any notice of Hiuen-tsang, the celebrated pilgrim to India, and of the Hindús who translated into Chinese the Buddhist books from their Sanskrit originals. He has limited his information on the subject of this religious system on account of the recent appearance of Dr. Eitel's *Handbook of Buddhism*.

There seems to be a deficiency in notices of mathematical and philological writers, and of the gods in the modern Taoist pantheon.

On account of the great variety and extent of Chinese anecdote and legend, the names of fabulous animals, places remarkable in legend, and expressions in which the student is likely to be puzzled by an allusion to ancient anecdotes, require in many cases to be explained. A considerable number of names and phrases which call for historical elucidation have been examined and explained in this work. All these illustrations of places and of phraseology will be found extremely useful. Much new information, not given in the dictionaries at the disposal of the student, will be here met with.

The Second Part, "Numerical Categories," consists of 317 articles, arranged in the way adopted in some Chinese Buddhist works. The Chinese writer and speaker are accustomed to take for granted that the reader and listener have had a Chinese education. Without introduction, they speak of the two primordial essences, the three kingdoms, the three religions, the three worlds, the four seas, the five elements, the eight diagrams, the nine degrees of relationship, &c. To have a dictionary of these expressions, arranged numerically, is most convenient.

At the same time, it may perhaps be said that the explanations are in many cases too brief. Too little is said on the twenty-four solar terms. In regard to the twenty-eight constellations, while they are minutely described, no allusion is made to the interesting discussion as to whether they are the same or not with the twenty-seven Hindú *nakshatras*, with which they generally agree, and as to whether the arrangement was borrowed by the one nation from the other.

Students would find it advantageous to have this list expanded into a volume. But, in the meantime, Mr. Mayers has done very much to deserve their gratitude.

The Third Part places before the student chronological tables, such as are found in Morrison's *Philological View of China*, and in the arrangement by Dr. S. W. Williams. These new tables are, however, more complete.

JOSEPH EDKINS.

La Vie d'un Patricien de Venise au Seizième Siècle. Par Charles Yriarte. (Paris: Plon, 1874.)

It is always interesting to trace the process of a book's growth, and luckily M. Yriarte

provides us in the present case with all necessary information. He was travelling, he tells us, in Italy, and paid a visit from Venice to a charming villa at Masera, near Trevigi. This villa, unknown to most art-travellers, contained some very fine decorative frescoes by Paul Veronese; it had been built by Palladio, and was adorned with sculptures by Alessandro Vittoria. The Venetian noble whose name was graven on the inscription above the doorway was Marco Antonio Barbaro. M. Yriarte was greatly struck with the villa, and began to wonder what sort of man Marco Antonio Barbaro might have been. He accordingly wrote an account of the villa to the *Revue des Deux Mondes*, and set to work to find out all he could about Barbaro.

The more he pursued his subject the more it delighted him. For two years he worked at it, and round the questions raised by the notices he was enabled to find of Barbaro's life many points of Venetian history gradually grouped themselves. M. Yriarte felt the pleasures of "research" with all the enthusiasm of a novice. He had begun his work as a *littérateur*; he found himself gradually rising to the dignity of an historian. His joy reached its climax when he discovered a portrait of Barbaro, by Paul Veronese, in the Belvedere Gallery at Vienna. His eye was caught by the face of a portrait: "un pressentiment, que comprendront ceux qui ont vécu dans la contemplation d'une idée fixe, nous porta à solliciter du directeur l'autorisation de descendre la toile." On examination an inscription was found, which proved to M. Yriarte the justice of his presentiment. A more commonplace man would have looked at his catalogue, where he would have found the name of the portrait given at length (No. 29, Ed. of 1865) and also a copy of the inscription, which differs from that of M. Yriarte, and which we sadly suspect to be more accurate.

In this enthusiastic way he laboured on, "cherchant notre personnage aux quatre coins de l'Europe," endeavouring to reproduce his times and all that concerned him. But he was not, at the same time, without a lofty moral purpose in his work. The disasters of France showed too clearly the evils of individualism, and the need of those virtues which Venice embodied, "la renonciation de l'individu au profit de l'Etat, la subordination de l'intérêt privé à l'intérêt public." This was the example which he wished to set before his countrymen.

This sketch of the book's origin and progress shows at once its merits and its faults. It has the merits of freshness and enthusiasm; it is eminently readable on a subject where it is very easy for a writer to become dull; its pedantry, wherever it occurs, is so simple and innocent that it becomes amusing. The book is the result of honest work, and brings together in a pleasant form much interesting information on a most interesting subject.

But, on the other hand, the form of the book is an impossible one. We wish, as we read it, that M. Yriarte had been content to be a *littérateur*, and had not aspired to become an historian. If the book had been a

series of essays on Venice in the sixteenth century, it would have given M. Yriarte greater play. As it is, its hero is a mere phantom. His name can be traced, it is true, through the Venetian archives as holding successively most of the great offices of state; but this serves only to give him a fictitious reality. About himself, his character or his private life, we know nothing. The book is, therefore, a series of digressions. Barbaro was born a patrician of Venice—we must therefore know how the patriciate grew up: he married a wife—so we must hear about Venetian ladies generally: he entered the Great Council and the Senate—then follows an account of the Venetian Government: he went as ambassador to France and Constantinople—and this leads to the general question of Venetian diplomacy: he was appointed overseer of the University of Padua—and this calls for an account of that institution. But in all this we look in vain for any features of Barbaro himself: nothing is known about him save names and dates, and despatches, which even M. Yriarte confesses do not stand in the highest rank among the productions of Venetian envoys. Historical biographies are generally used as a means of enlivening the tedium of unmitigated history by the introduction of personal traits and incidents which give reality to the whole. In the present case the general history is pleasant enough, but the hero of the biography appears as a sort of tedious interruption to the easy flow of the essays for which he forms a text.

Barbaro's career is in itself an instructive instance of the laborious life which a Venetian patrician was called upon to lead. Born in 1518, he began at the age of twenty to sit in the Grand Council, and for the next fifty-seven years was never free from the discharge of onerous public duties. For two years he was ambassador in France; for six years he was ambassador at Constantinople, where he was thrown into prison by the Sultan on the outbreak of the war which led to the battle of Lepanto. The Government of Venice, which was the wonder of all the political theorists of the sixteenth century, was certainly not carried on at a small cost. The amount of labour entailed on all its officers was prodigious. Its ambassadors all over Europe sent despatches every week: these despatches were read by the Doge's Council, and a *résumé* of their contents placed, if necessary, at the disposal of every member of the Senate. No steps of any importance could be taken without many discussions in different small committees before the matter came finally before the Grand Council. Besides the elaborate care taken in obtaining information, and the accurate attention to details which the Venetian Government required from its nobles, we must take into account its great complexity owing to the immense number of checks and counter-checks which were imposed to prevent the growth of any individual to too great power. The process even of electing an official was so lengthy and complicated, with ballots again and again repeated to determine the ultimate selectors, that we are tempted to think that each election must have taken at least six hours.

This jealous and suspicious aristocracy sacrificed the freedom of all that it might maintain the privileges of a few. So strong were the chains of the system which had slowly grown up, that few dared attempt to escape from it, and all learned to move with solemn majesty and hide their fetters under magnificent robes. The position of their Doge was but an example of the position of all the rest. An old man who had grown greyheaded in the service of the State, whose name was connected with some great victory or some successful embassy, was chosen to be the symbol of the Republic. He was not allowed to refuse the office, under pain of forfeiture of all his goods: he was attired in splendid robes, he sat on a throne in the Council, when he entered the room all rose and bowed, he was treated as an equal by foreign princes, he was addressed in public as "Serenissimo principe,"—yet in private men were bidden by law to speak of him as "Messer il Duca," and he might not open even a private letter except in the presence of three counsellors.

The same dark spirit of suspicion went through the whole of Venetian life. The women were constrained by custom to wear in the streets pattens two feet high, and when a foreign ambassador once said how much more convenient low slippers were found in other cities, an austere senator grimly remarked "Pur troppo commodi! pur troppo." The splendid Venetian women whom Paul Veronese painted, knew little of society, and were rarely seen beyond their own household circle. They had no share in the literary culture of Italy, but spent their time in blanching their masses of hair by wetting it and exposing it to heat—sitting in summer for hours on their balconies in the heat of the sun, with their faces shaded by a broad straw brim without a crown. It was regulated by law what jewels they might wear; only on the rare occasions of such festivals as Paul Veronese delighted to paint might they appear in public in all their wealth of apparel.

M. Yriarte's work will certainly give full materials for judgment to anyone who wishes to find out the price paid for the gravity, the magnificence, the calm and the decorum for which Venice was famous. Its painters rejoiced in outward splendour, for little else that was lovely was suggested to them by the life around. But it went ill with them if they gave too free scope to their fancy even for splendour. Paul Veronese was brought before the tribunal of the Inquisition for having painted too many accessory figures in his picture of the Last Supper at the Church of San Giovanni-e-Paolo. It was useless that he urged his principle of art, "When I have a little space left in a picture I adorn it with imaginary figures." The tribunal administered a reprimand, and ordered him to amend his picture within three months.

The account of the painter's cross-examination by the inquisitors is extremely interesting. It was extracted from the Venetian Archives by M. Armand Baschet, and communicated by him to the *Gazette des Beaux-Arts* in 1867. It is characteristic of M. Yriarte's notions of research that, while feeling himself above the necessity of pub-

lishing "pièces justificatives" on other points, he thinks it desirable to rescue this document from its obscurity in the pages of a magazine, and hand it down in his book for the use of future biographers of the painter. He accordingly publishes in an appendix, not the original document, but a French translation. M. CREIGHTON.

The Modern Householder: A Manual of Domestic Economy. Compiled by Ross Murray. New Edition. (London: Frederick Warne & Co., 1874.)

THE English language is seriously deficient in providing no word analogous to *Hausfrau* or *Hausmutter*, to signify the woman who at once rules the house as mistress, and technically "keeps" it. The term "house-keeper" is always understood to signify the domestic servant to whom the lady of the house delegates her office, unless by some involution of phrase the speaker manages to convey the fact that (in the language of the servants' hall) "the lady is her own house-keeper." Nevertheless, though we have not the word, we English have the thing, and in much greater perfection than our German cousins who possess the word, but with whom (except in the very highest station of society) the housekeeping mostly swallows up the whole woman, and leaves little for either the "frau" or the "mutter." If English girls were educated practically, as they are theoretically, to become good wives and mothers, and not merely to attract lovers, this housekeeping business would be an invariable element in their education, instead of being left to be learned, on the principle of *solvitur ambulando*, after a thousand costly mistakes, when they are married. Two or three years ago an excellent little tract on this subject, by Mrs. Shaen, explained how readily an experienced mother, governess, or schoolmistress might direct her pupils' attention to the numberless household matters which every mistress of a house ought to understand, but which not one in twenty is ever taught—to the nature and principle, for example, of stoves and cooking apparatus; of gas pipes, drainage, cisterns, and water supply; how to choose good and solid furniture; the qualities of linen, the freshness of meat, fish, and vegetables, and twenty similar matters. The present handsome volume, with its 5,700 references and receipts, might serve very well either for an encyclopædia to instruct the teachers of such exceptionally "useful knowledge," or to supplement the lack of such oral instruction—so far as a printed volume can be a substitute for actual lessons given by a clear-headed person with the things to be learned before the pupil's eyes. We should not, perhaps, for our own part, have opened the brief introduction to a book on Housekeeping by one of those references to "modern science" which seem to have become the preliminary *de rigueur* just now to the discussion of every subject under the sun, from theology to cookery; nor should we have thought it needful to terminate our address by a quotation from the Psalms. These details, however, are matters of taste, like the somewhat artificial bouquets (too suggestive of the florist's shop) which the

elaborate illustrations set forth for admiration, and for which we advise our lady readers to substitute nosegays arranged by their own fair hands, according to their own sweet will. The flowers on a lady's table and in her drawing-room ought to be a part of herself, like the *coiffure* of her hair; and if she should even go so far as to arrange also the fruit for her dessert, and make a living vegetable picture of grapes and melons, and peaches and nectarines, or of pomegranates and prickly pears, and bananas and rosy apples, and quinces, medlars and odoriferous little Tangerine oranges, she will not have derogated very far from her house-mistressly dignity.

There are a series of useful things in *The Modern Householder* beside these details. There is, to begin with, some sound advice and information about choosing and hiring houses (which the author thinks should not exceed in cost one-eighth of the owner's income), and a good many hints about furnishing; the glass and china needed for houses of different pretensions; and the best mode of lighting with lamps, gas, and candles. Then follow many learned pages respecting the elements contained in different kinds of food, which may possibly be very instructive from the point of view of "modern science," but which will hardly, we imagine, be directly serviceable to the lady housekeeper, whose choice of a pound of rump-steak for a family luncheon will scarcely be determined by the knowledge that it will contain 8 ounces of water, 1 ounce 62 grains of gelatine, 1 ounce 122 grains of fibrin and albumen, 4 ounces 340 grains of fat, and 350 grains of mineral matter. She may, however, be mercifully deterred, to the great benefit of her family and friends, from ordering Dutch butter for kitchen purposes by the alarming story (p. 138), that "the suet or fat of dead dogs melted down with oils and chemically prepared," and also the slimy sewage of the Thames, are sent to Holland, and from thence imported back to the London markets as Dutch butter.

After this "scientific" information, follows a large collection of cooking recipes, a few of which having been submitted by us to competent domestic authority, have been pronounced worthy of acceptance. They are in some cases illustrated by pretty little pictures, whose brilliant reds and greens will, we fear, drive the culinary soul to despair, or provoke it to have recourse to certain necromantic tricks for producing those hues scarcely less nefarious than the Black Art of the Middle Ages. Another department of this all-containing book relates to Feeding the Family, and concerns the ordering of meals. The author ought not to have quoted without caution Dr. Kitchener's advice, which presumes an exploded order of things. In none of our large towns at the present day is it expedient, even if it be possible, for a servant belonging to a family of the upper class to go to market, as is still the custom on the Continent; and as to the old gentleman's proposal to eat the same things the same day of the week all the year round, we denounce it with indignation as an abominable invasion of the natural liberty of man. It is true that a certain connexion between the Sabbath and roast

beef and plum pudding for the servants' dinner does prevail in most families belonging to the Church of England, and that a similar occult relationship between the same sacred day and roast veal and apple pie is noticeable in houses where Dissent has seemingly severed the venerable orthodox tradition. These mysterious and filmy webs of thought and taste are no doubt allied in some manner—could we but trace the connexion, to that still more remarkable difference between High Churchmen and Evangelicals, signalised by the butler who enquired respectfully from his master the opinions of his intended guests—"Because, Sir, if they're 'igh, Sir, they drinks; and if they're Low, why then, Sir, they heats."

Though the author of the chapter on dinner parties overawes us by telling of the "house of a nobleman with whom we occasionally dine," we venture to differ from him as regards the inordinate quantity of sweets in proportion to the dinner which he is prepared to order. Where a French cook would have two, and an Italian a simple "dolce" (a paragon of art, by the way), he recommends three, four, or five costly and troublesome dishes, for which none but aldermen's wives and misses in their teens (who have no business at a dinner party at all) could possibly find appetite. This exorbitant proportion of sweets is a sure token that the mistress of the house has obtained her ideas of splendour from the lower stratum of English society, and not from more refined tables at home or abroad.

We have exhausted our space and have only skimmed half through *The Modern Householder*. Suffice it to say that the accomplished lady who will take the book to her heart and make it a "part of her inner consciousness for ever," will thenceforth know innumerable things either "not generally known" or very imperfectly understood by the majority of mankind. She will have learned how to make presents—(fancy receiving a gift labelled "as a very small token of regard," from a lady on whose table one had just seen *The Modern Householder*!)—how to be abased so far as to "visit the poor," and how to be exalted so far as to be "presented at Court;" she will know the art of preserving the skins of hapless birds to decorate herself withal, and how to improve her complexion by flower of sulphur. She will be able to choose her own hunter, to treat him for occasional ailments, and select her own carriage. The cows for her dairy, the fowls for her barn-yard, the birds in her aviary, she will select and manage with unerring skill. And finally, for all the diseases wherewith herself or her children may be afflicted she will possess full information, both as regards the diagnosis of the symptoms and the most successful mode of therapeutic treatment. With such a book, indeed, in her hands, it is hard to see under what contingency of mortal life a lady would not find herself equipped for the full performance of her duties; and, joking apart, we believe there are very few ladies who would not gather very serviceable information from its voluminous and instructive pages.

FRANCES POWER COBBE.

The History of India, from the earliest Times to the present Day. By L. J. Trotter. Published under the direction of the Committee of General Literature and Education appointed by the Society for Promoting Christian Knowledge. (London: Society's Depositories. New York: Pott, Young & Co., 1874.)

THE writer who has engaged to produce a full history of India has great difficulties to contend with at the outset of his work. Old Sanskrit authors are not practical chroniclers; their genius is mythological and imaginative, and their heroes are of the same stamp. By the aid of contemporary records, Greece and Rome have been handed down to us in their periods of rise, zenith, and decline, respectively; and amid the great events of Western classical history, however remote, we find individual portraits and individual types of monarch, sage, and citizen. But while it is certain that something of Homer and the Greek tragic writers, with whom we become familiar in school life, is common to the poets of ancient India, the lessons of primeval literature in the far East have been rather of morals than of men: nothing is taught of actual history; and we are left to deplore the want of a Hindú Herodotus. On the other hand, when the writer or compiler has disposed of his two or three thousand years of mythology and fable; of Vedas, and thought before the Vedas; of early Brahmanism, Buddhism, and revived Brahmanism; of Aryan invasion and infusion, together with separation or absorption of aboriginal elements; when he reaches, in fact, the Muhammadan period, he is in far better case. And later on, when Muhammadanism has had time to spread and progress, he has his native Froissarts and Monstrelets in suprising number.

But the English historian's difficulties have not wholly ceased on the change of circumstances. If his materials have augmented he is not without embarrassment in the midst of riches. It is true that selection is a natural part of his duty, whereas invention is to be studiously avoided. Selection, however, from Muhammadan chronicles is no safe or easy matter; and even with the light European investigators and commentators so abundantly shed around him, the conscientious recorder of would-be truths cannot be otherwise than perplexed in setting the seal to each completed section of his book, though the period treated be subsequent to the conquests of Islam. He cannot indeed feel sure of his ground until he has fairly landed his fellow-countrymen on the shores of India, whether in Calcutta, the Carnatic, or Bombay; at which stage of narration he feels independent of purely local authorities. At the same time, the native chronicler should never be despised, for he is invaluable for collation and substantiation.

At the request of the Society for Promoting Christian Knowledge, Mr. Trotter has just produced a history of India "from the earliest times" to the period of the respective missions of Sir Bartle Frere and Sir Douglas Forsyth. He modestly calls it an "outline;" and in such form we give it a hearty welcome as a fit companion for the best of its predecessors. There is much of

power with little pretension, much of intelligent condensation, and a sufficient regard to the salient passages in Oriental chronicles exhibited in this useful volume, to make it popular as an educational medium. The author divides his matter into seven books, of which the first three treat of the days prior to the rule of the Company *par excellence*. The opening book, with separate chapters on the Aryan Hindus, Brahmanism re-ascendant, the early history of India and civilisation of Aryan India, is especially well told, notwithstanding the extra dash of colour at the close brought about by a glowing extract from the *Ramáyana*. From the middle of the fourth book to the end of the volume, each chapter bears the name of the English governor-general or viceroy whose administration it describes. There are a few pleasant and appropriate illustrations scattered among the pages.

The necessity of constant compression in a restricted work of the kind must be clear to all critics; and if we complain of occasionally too palpable demonstration of this drawback in the present instance, the author must not be held wholly responsible. But when freely exercised, the summarising process is full of mischief to the cause of historical truth. Events are either too crowded together to stand out with sufficient distinctness for apprehension; or there is forced acceptance of one out of two or three versions of the same general fact, without room for comment or expression of doubt. So in this as in other "outlines" of history, some few passages naturally suggest themselves to an attentive reader, where reconsideration and modification might be beneficial. We confine ourselves to two examples only. It is stated in pages 74, 75:—

"Dehli was saved by Belol Lodi, the Afghan governor of Multan, from falling into the hands of the independent King of Malwa. Ere long, however, Belol himself was laying siege to Dehli, but in vain. Withdrawing to his own provinces, he had not long to wait before Muhammad's death and the helpless condition of his son Ala-ud-din, whose sway extended only a few miles round the capital, again brought him with fairer prospects to the front. Ala-ud-din retired on a pension to Budaon, and in 1450 the grandson of the ennobled Afghan merchant founded a dynasty, which reigned at Dehli for about seventy-six years."

We surely miss an explanation of some kind regarding "the grandson of the ennobled Afghan merchant." For this is the first mention of Belol or his grandfather in the book; and the definite article presupposes an acquaintance on the reader's part with these two particular members of the family, which the ordinary student is not likely to possess. A very few words would clear up the mystery, and the solution is readily available in the translation of *Fa-rishta* by Briggs, vol. i. p. 544, &c. Belol, or Bahlul Lodi, or, as Ferrier calls him, Billal Lúd, is an important figure in Indian history; and some brief notice of his antecedents might have been given, though the whole dynasty of Saiyids is dismissed with ten lines.

Again, at page 130:—

"In 1637 Kandahar, the old appanage of the house of Babar, was surrendered to the Moghuls by its governor, Ali Murdan Khan. Ten years later, however, it fell again into Persian hands,

and the bravest efforts of Shah Jahan's officers and men failed, after three sieges, in winning it back."

It seems more probable that Kandahar was surrendered to the *Uzbeks* by Ali Mardan Khan, the governor for Persia, soon after the death of Abbas the Great (1628); and that Jahangir dispossessed the *Uzbeks* in 1634. We have the authority of the *Zubdatu't-tawárikh*, quoted by Malcolm, that the Persians retook the place in about 1647, when Abbas II. was a boy of fifteen, or, according to Chardin, not nineteen years of age.

We had rather Mr. Trotter had restricted the use of the *e* and *o* more than he has done in the transliteration of Indian names, and confess to preferring Muzaffar, Muhammad, Maisur, and Salim, to Mozaffar, Mohammad, Maisor, and Selim. "Alivardi," on the other hand (p. 190), we should write "Aliverdi," because the affixed verb is Turkish, for which language the *e* is indispensable. In conclusion, it may be added that the *u* in Burmah hardly illustrates the rule laid down in the Preface for the pronunciation of that letter; and that the authority of works lately transcribed by the *Saiyids* of Thatah, the most learned scribes of the country they inhabit, omits the final *h* in "Sindh."

F. J. GOLDSMID.

The Complete Angler; or, the Contemplative Man's Recreation. Being a Discourse of Rivers, Fish-ponds, Fish, and Fishing, written by Izaak Walton, and Instructions how to Angle for a Trout or Grayling in a Clear Stream, by Charles Cotton. With Original Memoirs and Notes by Sir Harris Nicolas, K.C.M.G., and Sixty Illustrations from Designs by Stothard and Inskipp. (London: Chatto & Windus, 1875.)

IN the hold which the name of Izaak Walton has upon English literature, we have a resemblance—faint, certainly, but still a resemblance—to that which is retained by the more illustrious names of John Bunyan and William Shakspeare. That this hold in the case of Izaak Walton has not become relaxed, is proved by the appearance of a new edition of *The Complete Angler*. The number of editions of this popular pastoral afloat cannot be exactly determined. In the chronicle of *The Compleat Angler*, by Thomas Westwood, published in 1864, mention is made of no fewer than fifty-three, imprints and facsimiles included. Five editions, we are informed by Sir Harris Nicolas, had the benefit of the author's personal revision. The original one was published in 1653, but appears to have undergone preparation for the press at least three years previous to that date. It came forth in the form of a small square duodecimo, bound in brown calf, and was embellished with plates representing trout, pike, carp, tench, perch, and barbel. These, with some show of probability, have been ascribed to a celebrated French engraver, Pierre Lombard, at that time resident in England. The price of this edition, which extended to 246 pages, was 1s. 6d. Throughout the next edition, that of 1655, a number of important alterations occur. The third issue appeared in 1661; the fourth in 1663, being a mere corrected

reprint of the preceding one; and the fifth in 1676, six years before "honest Izaak's" decease. The additions to this last-mentioned edition consisted of interpolations of a somewhat serious cast. The popularity of the dialogue during the ebb-time of the venerable Piscator's life (he died in 1683, at the ripe age of ninety-one) was evinced by the steady run maintained upon it. For three-quarters of a century no editions of *The Compleat Angler* possessing any interest followed the series we have referred to, that of Francks perhaps excepted—a highly-stilted production, in which farcical attempts are made both to outshine and depreciate old Izaak. In 1750, and afterwards in 1755 and 1772, one Moses Browne, a priest in orders and author of *Piscatory Eclogues*, lent a hand in the getting up of three editions of Walton, in each and all of which liberties with the original text were freely taken, and the pruning-knife applied mercilessly but without judgment. Hawkins's first edition of *The Compleat Angler* appeared in 1760, a second in 1766, a third in 1775, and three others in 1784, 1792, and 1797. Through these editions, which were carefully prepared and prefaced with a biography, *The Compleat Angler* was re-established in favour as a pastoral possessing great beauties, the editor culling his share of the laurels. Following the Hawkins, father and son, the names of a whole host of contributors to old Izaak's repute crowd the roll, among which stand prominent Bagster, Gosden, Major, Rennie, Jesse, Pickering, Bethune, &c. &c. There has perhaps been as much rivalry in the getting up of a really good edition of Walton, as there has been in the getting up of one of Shakspeare or the *Pilgrim's Progress*. Pickering's celebrated one of 1836, in two volumes imperial octavo, may justly be declared to outshine the others. Its preparation was the work, we were told at head-quarters in 1838, of seven years' constant labour. Of this edition our friend, Mr. John Bailey Langhorne, of Oatwood Hall, Wakefield (who, next to Mr. Alfred Denison, possesses perhaps the largest and finest collection of angling books in Great Britain), became some years ago the purchaser of a unique copy. It is bound in four volumes, large paper, and contains duplicate proof impressions of all Stothard's and Inskipp's engravings; also a complete set of the proofs and engravings of Major's editions, and an immense number of proof and other impressions of engravings of fish, portraits of contemporaries, &c., from various publications on the subject. This copy was purchased by Mr. Langhorne for thirty guineas, and is esteemed a bargain. Beside numerous copies of fine editions of *The Compleat Angler*—Bagster's of 1808, Major's fourth edition, and Jesse and Bohn's of 1856, among others—Mr. Langhorne has also in his possession three or four of Inskipp's finest works. His perch, the original design for the Walton, but not the one adopted, is considered unrivalled. Mr. Alfred Denison's collection of works on fishing, gathered from all quarters, and embracing, no doubt, lots of Waltons, extends to nearly 2,000 volumes.

The present edition of *The Compleat Angler*, with its concomitant treatise on Fly-

fishing by Charles Cotton, the *fidus Achates* of Walton, is indebted for its getting up mainly to Sir Harris Nicolas and Mr. Pickering. Acknowledgments are profusely made in the preface to gentlemen well known in their connexion with the press and general literature, for the assistance given by them in what we are inclined to call the production of an *omnium gatherum* in which morsels of biography are interlarded with scraps of silly rhyme and wishy-washy sentiment. In fact, the new edition, so called, partakes, like many of its predecessors, more of the nature of a compilation, made up of far-fetched, as well as of immediate and intimate accessories, than of the inscription bestowed upon it. All the support and adornment it has received in its getting up from the contributions tendered by Sir Henry Ellis, Dr. Bliss, and others, appear to us in the light of incumbrances. The pure, simple, original text of the patriarchal angler, by such means of sublime and scholarly intervention, has been debarred from speaking for itself; and a mantle has been thrown both over the author and his subject, which, while it does not absolutely deform, caricatures and disguises them. The prominent feature in this new edition which will give value to it in the eye of the collector, is the engraving in front, taken by Mr. Humphreys, after the original picture by Housman, in the possession of the Rev. Dr. Hawes, Prebendary of Salisbury. To this picture the engraved portraits of Walton in common circulation no doubt owe their origin, but they want, all of them, the fidelity and cast of character which are said to belong to the one now put forth. As a book, the volume before us is not too gaudily caparisoned, but on the whole neatly trimmed and winsome to the eye. There is room for it in the world among its predecessors; and in the getting up the publishers have done it every justice. The illustrations, from designs by Stothard and Inskipp, will always form attractions sufficient in themselves to ensure an immediate sale.

THOMAS TOD STODDART.

A Memoir of the Lady Ana de Osorio, Countess of Chinchon and Vice-Queen of Peru (A.D. 1629-39), with a Plea for the Correct Spelling of the Chinchona Genus. By Clements R. Markham, C.B., F.R.S., Commendador da Real Ordem de Christo, Socius Academiae Caesareae Naturae Curiosorum, Cognomen Chinchon. (London: Trübner & Co., 1874.)

THE introduction into India, and the successful cultivation upon a large scale in that country, of the most valuable medicinal tree produced on the Continent of South America, is one of those triumphs of enterprise of which the second half of the present century may well feel proud. To place within reach of millions of the inhabitants of that vast country a remedy of unfailing value, and thus to sow broadcast the seeds of life over districts invaded by fever, is a project the realisation of which will form one of the pleasantest episodes in the history of British rule in India. Considerations such as these confer on the tree whose bark is the raw material of quinine an interest

of far deeper significance than attaches to any other medicinal plant; and contributions to its history, whether from a literary or scientific point of view, must be cordially welcome.

Of all those entitled to write on such a subject, no one has a better claim to attention than Mr. Clements R. Markham, for it is to his sound judgment and untiring energy for fifteen years that the widespread and prosperous culture of the tree in India is mainly due.

The personage on whose behalf Mr. Markham now takes the pen is a lady of the seventeenth century, Doña Ana, Countess of Chinchon, a member of a noble Spanish family, tracing back a princely lineage of well nigh a thousand years. Doña Ana was the younger daughter of Pedro Alvarez Osorio, eighth Marquis of Astorga, and was born at Astorga in 1599. In 1615 she became the wife of Don Luis de Velasco, Marquis of Salinas, and went to reside at Seville. But the happiness of her marriage was of short duration, for her husband died in the prime of life in 1619. The young widow, who is said to have been remarkably beautiful, removed to Madrid, where she resided until 1621, in which year she bestowed her hand on Don Luis Geronimo Fernandez de Cabrera y Bobadilla, fourth Count of Chinchon. Mr. Markham leads one to infer (p. 23), that the widowed countess during her abode in Madrid was attached to the Court of Margaret, Queen of Philip III.; but this must be an error, as the Queen died in 1611.

The Counts of Chinchon, who were descended from an ancient family of Catalonia, derived their title from a small town in the province of Madrid, about twenty-four miles south-east of the capital. Mr. Markham, who visited Chinchon in October, 1866, discourses pleasantly of his trip thither by omnibus from Madrid across a high table land, intersected by deep valleys of fertile cultivated ground. These valleys, known in Spanish by the name of *vega*, possess a rich alluvial soil, but are by no means healthy, being infected by the germs of ague and intermittent fever. Chinchon itself occupies a hollow in the plateau lying between the *vegas* of Tajuña and Jarama, and is estimated to have a population of 6,000 souls. On the southern side of the town is the old castle of the Counts of Chinchon, once a noble residence, but now a complete ruin, having been dismantled, together with the church, by the French during the Peninsular war.

But to return to the history of Lady Ana. In 1628, that is to say, seven years after her second marriage, her husband, the Count of Chinchon, was nominated Viceroy of Peru; and in consequence of this appointment he proceeded in company with his consort to South America, arriving at Lima on January 14th of the following year. The chief events of the Count's viceroyalty were the rebellion in the Collao, the navigation of the Amazon, and the discovery of Peruvian bark. The last named is described by Mr. Markham in the following terms:—

"But the most notable historical event in this Viceroy's time was the cure of his Countess, in the year 1638, of a tertian fever, by the use of Peruvian bark. The news of her illness at Lima

reached Don Francisco Lopez de Cañizares,* who was then Corregidor of Loxa, and who had become acquainted with the febrifuge virtues of the bark. . . . A Jesuit is said to have been cured of fever at Malacotas, near Loxa, by taking the bark given to him by the Indians, as long ago as 1600; and in about 1636, an Indian of Malacotas revealed the secret virtues of the *quina* bark to the Corregidor Cañizares. In 1638, therefore, he sent a parcel of it to the Vice-Queen, and the new remedy, administered by her physician, Dr. Don Juan de Vega, effected a rapid and complete cure."

The Countess with her husband returned to Spain in 1640—"bringing with her" (to quote Mr. Markham),

"a supply of that precious *quina* bark which had worked so wonderful a cure upon herself, and the healing virtues of which she intended to distribute among the sick on her lord's estates, and to make known generally in Europe."

These projects, it may be assumed, she carried out, for it is certain that the powdered bark became known in Europe as *Pulvis Comitissae* (the Countess's powder); while the local traditions of Chinchon and the adjacent town of Colmenar still preserve, even to the present day, as Mr. Markham assures us, the memory of the good deeds of the Countess in ministering to the sufferers from tertian ague in the fruitful but unhealthy *vegas* of the Tagus, Jarama, and Tajuña.

There can be no doubt that the cure of a dangerous fever in the person of a patient of such high distinction as the Vice-Queen of Peru had the effect of drawing great attention to the new remedy, and that the employment of the drug in Europe dates from this event. But Mr. Markham might well have added that the use of the bark was largely diffused by the Jesuits, at the instigation in the first instance of the Countess herself—such being the statement of La Condamine,† who, after describing the distribution of the medicine by the lady, adds, "*Quelques mois après elle se débarrassa de ce soin, en remettant ce qui lui en restoit aux RR. PP. Jésuites qui continuèrent à le débiter gratis.*" Among the ecclesiastical patrons of the new febrifuge, the most zealous was the Spanish Cardinal de Lugo, whose pleasure it was to distribute the febrifuge gratuitously among the poor of Rome.

The first four sections of Mr. Markham's work having been devoted to the family history of the Count and Countess of Chinchon, and the fifth to a description of the town of Chinchon and its surroundings, the author in the concluding section sets forth his "Plea for the Correct Spelling of the CHINCHONA Genus."

"It was not," writes Mr. Markham, "until the French expedition of Condamine and Jussieu to America in 1786, that the forests of Loxa were visited by scientific men, and a few years afterwards Condamine sent specimens of the *quina* plant to the great Swedish botanist Linnaeus, who was the first to describe it. The name of a new and most important genus was then to be given by Linnaeus, and he chose for it the most appropriate that could possibly have been selected, namely, that of the noble lady who had first made

its healing virtues known. . . . But most unfortunately, Linnaeus was misinformed as to the name of her whom he desired to honour;"

—and instead of calling his new genus CHINCHONA, he termed it "CINCHONA," which name has been generally accepted by botanists, from whose diction it has passed into the domain of medicine and chemistry.

It is now several years since Mr. Markham lifted up his voice against this corruption, or, as he terms it in the present work, this "ill-omened mutilation of the Countess's name;" but hitherto, it must be confessed, with but small effect. The new spelling has indeed been adopted in the official documents of the Indian Government, but it scarcely finds acceptance in a single scientific work on botany or chemistry.

DANIEL HANBURY.

Te Rou; or, the Maori at Home. A Tale exhibiting the Social Life, Manners, Habits, and Customs of the Maori Race in New Zealand prior to the Introduction of Civilization amongst them. By John White, Native Interpreter, &c., Auckland. (London: Low, Marston, Low & Searle, 1874.)

ALL novels must, or ought to be, we suppose, more or less instructive, and the attempt to make them didactic is nothing new. We have abundance of historical romances, the history contained in which must be received with befitting caution; but the novel ethnological is something fresh. No doubt, every novel describes with more or less accuracy the manners of the people whom it deals with. But a story avowedly written for the purpose of more easily conveying heavy ethnological details about a people so comparatively little known as the New Zealanders has the field to itself. Where is it all going to end? We shall soon have "*Dy = F(x + Dx) - F(x)* &c., &c., a Tale of the Infinitesimal Calculus;" "Prince Apophysis and the Ossa Innominata of the Pelvic Cave, a Christmas Fairy Tale, intended to convey some Idea of the Anatomy and Relations of the Sub-abdominal Viscera." "The Horror-stricken Hyperbola and the Panting Parallelogram; a Geometrical Burlesque," and so on. We dread the prospect. Luckily, it is as yet afar off, if Mr. White's success is to be taken as any criterion of the practicability of this proceeding. Since the day when the *Loaves of the Triangles* snuffed out Erasmus Darwin's stately botanical poem, we have had nothing like the book which heads this notice. To say that it is the worst novel that ever was written would be a rash assertion, when the novelistic crop is so rank and vile. But this we will say (from a limited experience, it is true) that it is the worst we have any recollection of perusing. To relate the plot would be manifestly a waste of space. Indeed, there is scarcely any. The story and the characters are each so many lay figures—pegs on which to hang details formidable in their very information. Mr. White is apparently an admirer of Mr. Fenimore Cooper, and in his "story" we have the same romantic beings making grand speeches, striking up stage attitudes, and spouting verse like so many moonstruck poetasters.

* In Mr. Markham's *Travels in Peru and India* (1862), p. 5, this person is called Don Juan Lopez de Cañizares.

† *Mém. de l'Académie Royale des Sciences pour l'année* 1788, p. 234.

But Mr. White differs from Mr. Cooper in the fact that the latter knew nothing about the Indians, but was an admirable novelist, and it is not Chingachgook and Muck-amuck who speak in his pages, but Mr. Fenimore Cooper. On the contrary, novel writing (as we have already hinted) is not the forte of Mr. John White, of Auckland, New Zealand, while he has a minute and extensive knowledge of the people whose manners he attempts to describe through the mistaken medium of a romance. Not a paragraph but bears witness to his lack of novelistic skill, while it affords abundant evidence of how thoroughly he is acquainted with the customs, traditions, and language of his heroes and heroines. Every page is crammed with facts, technicalities, native names, and records of customs, while they overflow in a series of erudite foot-notes. After wading through the mass of knowledge in the body of the book, it is too much to expect us to stand over the shoes in the slops of his learning at the bottom of the pages. The preparation for battle, the summoning of allies, the defence of the pah, &c., are all described through the medium which the author has selected, often with considerable ability and vividness, but more frequently with tedious detail, which both show the unsuitableness of such a story to convey the desired information, and the inability of the author to manage the fiend he has raised. Such chapters as "Rou's Indignation at the Burial of his Slain Enemies"; "His Dissertation on how Public Opinion is led, and his Vow of Vengeance"; "A Debate on the Power of Disembodied Spirits," &c., do not promise very lively reading. The author assures us that all his facts are facts; but we are often at a loss to know what are facts, and what simply garnishing or setting to them. Numerous interesting details, new or confirmatory of dubious statements, are found in every chapter. Some of the details he gives of the abominable cannibalism existing at one time among the Maoris are horrible in the extreme:—

"A young chief took a rib, and, while picking it, stood over the old woman directing the division of the flesh. A young damsel also took some flesh from a leg, and returned to her group of young companions, who asked for a taste. The flesh having been divided, the baskets were set before those who were to feast, and soon all were eating, laughing as they picked the bones. Those who had a thigh or an arm-bone would bruise one end of it, warm it again at the fire, and suck the marrow out of the bruised end; and to make sure of getting it all out, they would heat a fern stalk, which they passed through the bone, then draw it across their lips, sucking the marrow off with their curled, protruded tongues."

Indeed, if the "tale" had been written to illustrate the practice of cannibalism, there could not have been more about man-eating in it. There is one, and only one, redeeming feature in Mr. White's book as a novel—it is in only one volume. If it had been in the orthodox three, there would have been nothing for it—especially as we are threatened with a series of such tales—but an application to the Auckland Supreme Court to restrain Mr. John White in perpetuo from inditing any more Maori tales. The sharp medicine of a limited circulation

may, however, teach him quite as effectually that he has made a mistake. Mr. Mudie's subscribers will have none of him, while the St. Martin's Place people will fight shy of an ethnologist who cannot be "quoted" with safety. Mr. White is possessed of too much valuable knowledge to allow of its being thus virtually lost to the world. Therefore let us respectfully suggest to him that, in the next Maori book he writes, he should give us our ethnology undiluted; and if he is irretrievably afflicted with the *cacoëthes* of the *improvisatore*, to put his story in an appendix—or still better, say—in a pamphlet printed for private circulation. Even had we any means of distinguishing his facts from his fiction, it is too much to expect anyone to go to the labour of picking them out of the mass of rub—well, we wish to be civil—incongruous material, in which they are enveloped. ROBERT BROWN.

THE COMITIA CENTURIATA.

Die Centuriatcomitien: Programm der Kön. Studiens-Anstalt Landshut. Von J. Ullrich, k. Studienlehrer. (1873.)

HISTORIANS of Rome have been almost unanimous in supposing that during the Republican period the great popular assembly, the *Comitia Centuriata*, passed through a radical reform by which the system of classes based on property attributed to Servius Tullius was harmonised with the division of the State into local tribes. The main question in dispute has been at what time or times so great a revolution was brought about. In the above-named pamphlet, however, we have a learned German maintaining that no such revolution ever took place; that the mode of voting in the *Comitia Centuriata* did not vary during the whole Republican period; that the Servian system of classes perished under the monarchy, and was never revived under the Republic. He writes, too, with so much force and clearness that the pamphlet cannot be passed over by future enquirers.

Every thoughtful reader of early Roman history asks himself the question—is it credible that a vast stride towards democracy should have been taken without a struggle, and find merely a dim record in one or two chapters of Livy and Dionysius? Can the lower classes have submitted for centuries without a murmur to almost total exclusion from the franchise in the supreme assembly, and can the upper classes in one moment have let in the full democratic tide? The difficulties are so great that it would be a relief to accept so simple a doctrine as that of Herr Ullrich, which we can only sketch in outline here, not discuss.

The local tribe then, our author maintains, was the sole basis of the Republican government. Tribe and curia were politically identical, and only religiously distinct. Even the patrician could only be *civis* by virtue of being *tribulis*; on the other hand, the plebeian was also member of the curia. Among a good deal of evidence adduced in support of these statements, the fact most relied on is the original election of popular tribunes in the *Comitia Curiata*, which is emphatically affirmed by Dionysius and Livy, and must be credited if we mean to accept any

fact at all on their authority. It follows that the plebeians were members of the curiae. Of what use then was the *Comitia Tributa*? It originated in a determination on the part of the plebeians to exclude the patricians from elections to the tribunate. The repeated attempts of the nobles to vote in this assembly in very early times are evidence that they looked upon themselves as members of the tribes. The *Comitia Tributa* then was distinctively plebeian at first, and henceforward the *Comitia Curiata* was distinctively patrician. The two orders met on common ground only in the *Comitia Centuriata*, which was thus constituted. Each tribe was divided into two classes according to the age of the voters merely, and without reference to their property. Each half-tribe was a *centuria*, the same name being used for the eighteen equestrian divisions, twelve of which voted with the junior sections of the tribes (the first class), and six, the *sex suffragia*, with the senior sections (the second class). There was but one *centuria praerogativa*, chosen by lot from the centuries of the first class, excluding the equites. The first-class centuries were named *primo vocatae*, the second class *iure vocatae*, the word *iure* suiting well the senators and elder citizens whom the second class contained.

In order to find support for this theory, Herr Ullrich examines critically every recorded instance of vote-taking in the *Comitia*. He argues with great power that there is no real evidence in any ancient writer of the supposed revolutionary change. Livy and Dionysius certainly assume that some change did take place, but the assumption stands in direct antagonism to their positive records of the actual voting. Modern enquirers have either done violence to clear passages of these two historians, or, in the attempt to avoid this necessity, have, like one of the most recent authorities, Plüss, heaped revolution on revolution. Our author maintains with great plausibility that Livy, fairly treated, gives no support to the generally accepted scheme of Pantagathus. For instance, the voting was continuous, not successive, class after class, as that scheme requires; nor did the equites vote in a body immediately after the *centuria praerogativa*.

The most important difficulties in the way of the new doctrine are boldly faced. The undoubted predominance of the patricians in the *Comitia* for many centuries is accounted for by pointing to the great numbers of their clients and dependents among the plebs itself. With the votes of these the nobles needed no electoral engine (*Wahlmaschine*) so cunningly devised as to make victory a mechanical certainty. It may be noted that, probably from want of space, no attempt is made to account for the persistent recollection at Rome of the Servian class-system, nor is the evidence from inscriptions which Mommsen adduces in *Die Römischen Tribus* explained away.

We must here take leave of the learned author, merely remarking that even the veteran student of early Roman history cannot fail to learn from this little tract.

JAMES S. REID.

CURRENT LITERATURE.

Revue de Droit International et de la Législation Comparée. Organe de l'Institut de Droit International. 1874. 4me Livraison. (Londres, Bruxelles, Paris, &c.) The present number of this review is of unusual interest, as it contains an account of the proceedings of the Institute of International Law during its annual session held at Geneva in the autumn of 1874, as well as of its principal transactions. Among the latter may be mentioned an examination of the Three Rules of the Treaty of Washington from the pen of M. Charles Calvo, corresponding member of the Institute of France, with a report from Professor Bluntschli, of Heidelberg, on the same subject; a report prepared by Professor Mancini, of the University of Rome, in conjunction with Professor Asser, of Amsterdam, on the existing law of domicile, and on the assimilation of law as regards marriage, succession, and foreign judgments; and the substance of the deliberations of the Institute on the most convenient system of procedure to be adopted in the conduct of international arbitrations. The proceedings of the Institute will be resumed at the Hague on August 25 of the present year. In addition, Mr. John Westlake, Q.C., has contributed a second article, which completes his very useful digest of the judgments of the English Courts on questions of private international law during the eight years intervening between November 2, 1865, and the Long Vacation of 1873. Dr. Geyer, of the University of Munich, has also furnished a second article, completing his examination of the new Code of Criminal Procedure adopted in Austria, which he regards as a work of real progress, and in many respects a step in advance of the criminal procedure of the most enlightened States. The Review concludes with an article, by Dr. Kasperek, of the University of Cracow, on the civilising effects in Galicia of the new laws reviving the use of the Polish and the Ruthenian tongues in the schools and in the universities, as well as in the Courts of Law and in various branches of the administration. The question how best to deal with the great diversity of tongues which prevails within the Austrian Empire, has been long a problem of very difficult solution for the Central Government of Vienna. It has, in later times, wisely solved the difficulty by regulating the diversity instead of struggling ineffectually to suppress it. The Bibliography which is appended to the Review, includes a series of interesting notices of works recently published on juridical subjects, among which we may mention the following works of English writers: Sir Henry S. Maine's *Ancient Law*, Professor Sheldon Amos's *Lectures on International Law*, Mr. Henry Richard's *Historical Retrospect of the Triumph of Law*, and Mr. W. E. Hall's *Rights and Duties of Neutrals*. We select these works from a list of forty-four publications, as showing that English juridical writings are daily attracting increased attention on the continent of Europe.

On Heredity and Hybridism. By Serjeant Cox. (Longmans.) There is an interesting resemblance between the views of Mr. Serjeant Cox and those of Aristophanes, as reported in Plato's *Symposium*. That humourist, in an after-dinner speech upon the cause of love, asserted that human animals had originally two pair of legs and arms, and two faces, but that Jupiter having occasion to punish them and to reduce their strength, cleft them in twain. He then made men and women of the segments, and dispersed them. Each section thenceforward sought its fellow, and when two of these happened to meet they mutually embraced, longing to be reunited. Mr. Serjeant Cox, writing as soberly as any judge, on a kindred subject, propounds a theory of no less scientific value and of even greater simplicity. The fact is impressed upon him that man is a duplex structure, formed of two distinct halves, joined together, and he observes

"on closer inspection, that all other animals are so

made. . . . Then I bethought me, is there any other universal fact which might have some bearing upon this universal fact? Reflecting, the thought occurred to me that there is such a fact—namely, this, that two parents are required for the production of every organised being. . . . The conclusion instantly flashed upon me. . . . Two parents are required, because the body is constructed of two parts."

In short, he ascribes one half of the body to one parent, and the other to the other; and he takes much pleasure in showing how the fact of the hemispheres of the brain being in direct nervous connexion with the opposite sides of the body, must tend to fit and match its otherwise heterogeneous halves. It does not appear which side comes from the father, or which from the mother; neither is it perfectly clear whether the halving is, in heraldic language, *party per pale*, or whether, taking into consideration the aforesaid cross action of the brain, the blazon should not run:—*Quarterly*; first and fourth derived (say) from the mother; second and third from the father. It would be curious to inquire how many parents Mr. Serjeant Cox supposes to co-operate in generating a star-fish.

It may be well to mention, that persons who desire to read a concise and really scientific exposition of what has recently been made out by Balbiani and other microscopists concerning generation, will find what they want in the first part of the recent lectures of M. Claude Bernard. The part in question is published in Nos. 13, 14 and 15 of the *Revue Scientifique*, 1874, (Paris: Baillière), which may easily be had by book post; the price of each number is half a franc.

The Gentleman Cadet; his Career and Adventures at the Royal Military Academy, Woolwich: a Tale of the Past. By Lieut.-Col. A. W. Drayson, R.A., F.R.A.S. (Griffith & Farran.) The class of books to which this narrative belongs merits a wide circulation among English families where there are boys growing up for the professional world. Few means are more simple, and perhaps few more efficacious, for setting the current of young ambition in a right direction, than the perusal of well-expressed, healthy stories illustrating an experience likely to be the reader's own, and pointing to worthy results placed within his reach if endowed with a fair amount of natural ability. Nor is Colonel Drayson's volume interesting to boys alone. There is matter in it for the sober consideration of full-grown, thoughtful men, especially of army legislators and educational reformers. It is, moreover, readable throughout, for those who read simply to be amused.

The miseries of a cramming establishment, as it existed thirty years ago, are graphically described; and though these have not yet been removed by the introduction of that honest and intelligent supervision which is indispensable to meet the requirements of the time, it is to some extent the fault of parents themselves if boys are now left to the miseries of a "Hostler," or if they do not avail themselves of the services of a "Rouse."

Colonel Drayson describes Woolwich as it was; and it is with no unfriendly hand that he shows good cause for the reform which has happily been working in this and contemporary institutions of similar stamp, whether military or otherwise. Addiscombe, now among the things of the past, had many of the characteristics of the more generally known school for engineers and artillerymen. True that its "neux" was, in local parlance, a "green;" but the position and barrenness of privilege of both were alike; and its "old cadet" was, nominally, as well as in relative superiority and exclusiveness, the "old cadet" of Woolwich.

Let us hope, however, that we are not running, or have not yet run, into an opposite extreme, destructive of certain sturdier attributes which should distinguish even the best read and most intellectual soldier. Willingly do we accept the fiat that—

"taking it all in all, at the present time the Royal

Military Academy at Woolwich, is perfect of its kind, and the training given there will compare favourably with that of any military college on the Continent."

But we must not lose sight of the sentence immediately preceding, which we quote *in extenso*:—

"If there is a defect at the present time at Woolwich, it is that the cadet's comfort is too much cared for, and when he has, as he surely must have, even in peace time, to rough it, he will not, as we did, say, 'Well, it's better than being a cadet,' but he will probably compare the damp walls of a room in some fort with his snug room at the Academy, and the absence of many luxuries will be felt the more, because as a mere cadet they were considered essential for him."

SIR B. BURKE'S *Peerage and Baronetage* seems to grow more bulky every year, and bids fair to rival the London Directory in dimensions. This increase in size is not so much due to additions recently made to the ranks of the Peerage and Baronetage as to the fuller particulars which the compiler has given with reference to the descent of each title. In fact, the conspicuous merit of Sir Bernard Burke's work is, that it is not a mere chronicle of the births, deaths and marriages of the aristocracy, but is rather a carefully written history of the noble families of Great Britain. It explains by what services or under what circumstances each honour has been acquired, and it thus enables the reader to see that the vitality of our Peerage is due to the fact that its ranks have ever been constantly recruited from the people. It is an institution not a caste, and hence its usefulness and authority. Of course, Sir Bernard's work is not exempt from errors, and he will thank us for drawing attention to one of some importance into which he, in common with other peerage writers, has fallen. It is asserted by these authorities that the present Viscount Falkland deduces his descent in an unbroken line from "Falkland, the brave, the generous, the just," who fell at Newbury in 1643. Such, however, is not the case. The issue of the great Lord Falkland terminated in Anthony Cary, fifth lord, who died in 1694 (see *Evelyn's Diary*), and the title then passed to Lucius Henry Cary, grandson of the Hon. Patrick Cary, who was the patriot's youngest brother. This Patrick Cary ought not to be omitted, for he was a man of no common kind, and his poems (edited by Sir Walter Scott in 1819) contain some passages of great beauty.

MR. THOMAS TYLER'S *Philosophy of Hamlet* (Williams and Norgate), is that "with regard to the state of things in the world, and especially with respect to the moral condition of mankind," the philosophy of the play is pessimistic. Still, notwithstanding the general depravity, and the harsh and ungenial conditions of human life, all actions and all events are under the control of a superintending Providence. Man must execute the purpose of a Higher Power. This, however true (for one side of the play), is surely not new. Mr. Tyler misses the original optimism of Hamlet, and the cause that turned it to pessimism—his mother's unfaithfulness to his father's memory—and made him doubt Ophelia too. On this point Timon is the character to compare with Hamlet.

EDITOR.

NOTES AND NEWS.

WE regret to learn that Mr. J. Langton Sanford has been obliged through ill health to abandon his intention of writing *The Stuarts and the Puritan Revolution* in the "Epochs of History Series." The preparation of the volume has been handed over to Mr. S. R. Gardiner, and it will probably appear early in next year.

A SPIRITED proposal is about to be made by Jesus College, Oxford, which, if accepted by the University, will help to remove a standing reproach to it. Considering how important the Keltic element is in the population of this country, the absence of a Chair of the Keltic languages

and literature at Oxford is only too palpable evidence of the way in which the interests of learning have been allowed to drop out of sight there. Mr. Matthew Arnold pleaded eloquently in behalf of such a professorship some years ago, and the Society of Jesus College is now prepared to found one, should the University be willing to increase the emoluments which the College can set apart for the purpose. The composition of the Board of Electors will of course be a matter of anxiety to the promoters of the scheme, who naturally desire that a scholar, and the best scholar available, should be secured for the new Chair. Past experience has unfortunately shown, however, that official and educational interest, rather than scholarship, has sometimes been considered to constitute the best claim to the post of an Oxford Professor.

THE first edition of Mr. Sayce's *Principles of Comparative Philology* is out of print, and a new and revised edition will shortly appear.

WE understand that the larger part of the third edition of Mr. Moncreux D. Conway's *Sacred Anthology* has been purchased by a gentleman of this country and presented to the Brahmo-Somaj of India. In consequence of this Mr. Conway will at once bring out a fourth edition, which will contain a new and extended preface. This work has run through two editions in America, and is already largely used as a text-book in theistic pulpits both in America and England.

THE English Dialect Society has just issued to its members the remainder of its publications for 1873 and 1874, comprising ten reprinted glossaries and the first part of the list of works in and on our dialects. Almost the whole burden of the preparation for press—and a heavy one it must have been—has fallen on the Society's energetic director, Mr. Skeat, who shows his usual remarkable care in presenting the information with entire accuracy and in the most easily accessible shape. The principal glossaries now republished are the valuable ones by Ray, two centuries ago; among the minor word-lists are glossaries of Derbyshire lead-mining terms, giving some account of the curious mineral customs still in force in that county. The bibliographical list will prove of great service, many dialectal works being hardly known out of their own period and district; we are glad that Mr. Skeat has secured the help of local investigators, so as to render it tolerably complete. Altogether, the Society is well fulfilling its objects, and we hope that those interested in them who have not yet joined it will do so at once; the work to be done already threatens to overtake its resources, and it must be remembered that we shall not have our dialects with us always—or, indeed, much longer.

AT its last meeting the Royal Historical Society elected as honorary members the Rev. Dr. Moffat, the eminent missionary; J. J. A. Worsaae, the celebrated Danish archaeologist; Tom Sigurdson, President of the Icelandic Parliament; and Professor Meldahl, Director of the Royal Academy of Art, Copenhagen.

MR. DANIEL HANBURY's death, in the prime of life and in the midst of his learned labours, is a sad and irreparable loss to pharmacological science in England. He has been well known for the last twenty years as the author of a series of monographs, equally remarkable for their scholarship and scientific value, on the principal drugs of the Pharmacopoeia. The Royal Society's Catalogue of Scientific Papers contains a list of his chief papers down to 1863, and our readers will find most of those published by Mr. Hanbury since that date enumerated in the *ACADEMY* of November 14 last year. Mr. Hanbury was one of the editors of the *Pharmacopoeia of India*, and last year published, jointly with Professor Flückiger, of the University of Strassburg, his *Pharmacographia*, or history of the principal drugs of vegetable origin found in Great

Britain, which was reviewed in the *ACADEMY*. Hanbury's zeal in the science is well shown by two special trips into France, which he gives to the Manna. He had a will not be missed of pharmacology, and ult., very unex- am Common, and Frie- schhonderd duizend schatten. nederlandsche national labour-un- men het getal der aanhar- details about y authorities given to give a vivid picture of the lived, perhaps over-estimating a once upon Arnold himself.

THE *Nuova Antologia* for March, 1875, contains an interesting article, by Signor A. C. C. Boccaccio at Naples. Signor Casetti attempts to give us an accurate account of the somewhat obscure Signor Boccaccio's connexion with Fiametta. He agrees with most former authorities in supposing her to have been Maria, the natural daughter of King Robert of Naples, and not, as some have supposed, Maria, sister of Queen Joanna. Signor Clemente Lupi contributes a long article on the arrangement and organisation of archives; he has studied the question in England and especially in France, and is most favourably impressed with the methods employed in Paris.

SIGNORI GIUSEPPE RIGUTINI and Pietro Fanfani have brought out their *Vocabolario Italiano della Lingua parlata* (Firenze, 1875), a book which has apparently been expected with much interest. Its leading idea is to maintain the identity of the spoken with the written language, and to oppose those who speak of "repudiating the language of the writers." They wish to keep out from the language French words which are not legitimately derived from Latin for the expression of new ideas, and above all new and foreign constructions as well as those fluctuating expressions which come and go with fashion.

COLONEL J. L. CHESTER writes to point out that our reviewer was in error in attributing the discovery of the name of Milton's mother to Professor Masson. The credit of the discovery is due to Colonel Chester himself, as expressly stated by Professor Masson in a note on page x. of the "Memoir of Milton" prefixed to the "Golden Treasury" edition of Milton's Poetical Works.

OUR German friends have just started at Liegnitz a periodical of a wholly novel character. It is called *The Anticritic* (*Der Antikritiker*), and its object is to give authors an opportunity of answering adverse reviews and of criticising their critics. Hostile criticism and inappreciative criticism are, it would seem, the two enemies which are checking the free expansion of literary activity in Germany; and since authors are generally somewhat exacting personages, the critics are likely to have a bad time of it. Herr Nehring, the editor, will publish all communications which are paid for, those only excepted which might involve him in a suit for libel; and he looks forward to a healthy result to literature from this new experiment, "since the vital air of all intellectual activity is Freedom, and nothing but Freedom!"

AN essay on the distribution of landed property in England, reviewing the writings of several English economists, has been published by Dr. Wilhelm Roscher, the celebrated author and Professor of Political Economy at Leipzig, under the title *Der neuere Umschwung in den englischen Ansichten vom Werthe des Bauernstandes*. He

arrives at the conclusion that the pathology of the English writers whose works he reviews is excellent, but so much cannot be said for their therapeutics. They fully establish that the disappearance of a landowning peasantry is a serious evil, but fail in the discovery of any efficacious remedy. Germany, he says, has still such a peasantry, and the future of the German nation depends on its preservation. Dr. Roscher might add that in a recent debate in the Prussian Parliament, the Finance Minister, Camphausen, stated that he had brought up in a province the extraordinarily subdivided among and he had all his life upheld the subdivision (*Parzellirung*) of property as one of the first interests of agriculture. So long, he continued, amid loud applause, as the administration of the State domains was entrusted to him, he would do all that lay in his power for that end.

ACCORDING to a decree of the old Council of the German Confederation, which has been recently confirmed, and which settles the organisation of the general board of direction for the editing and publication of the *Monumenta Germaniae*, the Academies of Science at Vienna, Berlin and Munich are each entitled to nominate two members. In conformity with this enactment, the Austrian Academy has selected two of its own body, Professor Sichel of Vienna, and Professor Stumpf Brentano of Innsbruck, to sit at the board.

THE last number of the *Preussische Jahrbücher* gives the concluding part of a series of articles entitled "Nordalbingische Studien," in which the writer, Dr. Nitsch, of Berlin, narrates at length and with much care the mediaeval history of those lands north of the Elbe which under the Valdemars of Denmark were included in a ducal principality under the name of Nordalbingia. The enormous influence exerted on the destinies of the whole of Scandinavia, including the Danish provinces of Jutland and Slesvig and the Holstein territories, by the civic republic of Lübeck in the fourteenth century, is vividly set forth in Dr. Nitsch's narrative of the course of events under Valdemar III. of Denmark, when his necessities, and the disturbed condition of Sweden and Norway under the feeble rule of Magnus Smek, made the Syndicate of Lübeck the real sovereigns of those lands, a large part of which was then and in the beginning of the fifteenth century held in pawn by the republic. The materials employed by Dr. Nitsch have been drawn chiefly from the Lübeck Chronicle and the archives of the city, which are now in process of publication, and of which he has made good use in elucidating the intricate and important question of the conflict carried on by Slesvig and Holstein against Denmark, over which the policy of the Hansers of Lübeck exerted so powerful an influence.

THE first number of a *General German Biography* in twenty volumes, to be completed in ten years at a cost of 240 Mark, for the entire work, has just been issued. This colossal undertaking is under the immediate supervision of Professors Ranke and Döllinger, who have undertaken to co-operate with the active editors, Herr von Liliencron, of Munich, and Dr. Wegele of Würzburg. The first number, which contains articles under Aa—Ahlefeldt, has been begun upon a scale which threatens to carry the work to twice its projected size, if anything like a just proportion is to be maintained.

THE first annual series of the works published by the "General Society for German Literature" at Berlin has appeared. It includes a notice by F. Bodenstedt of "The Remains of Mirza Schaffy," and we observe that the same writer will contribute to the next year's issue a treatise on "Shakespeare's Women," while R. Gosche is to write a critique on the "Life and Works of Jonathan Swift" for the same series.

WHEN half a century ago Friedrich Pertz planned the great cycle of European histories which was to appear under the direct supervision and editorship of Professors Heeren, Ukert and Giesebrecht, a period of eight or at most ten years was fixed for the completion of the undertaking, which it was announced would consist of certainly not more than forty volumes. The present year is the forty-sixth that has recurred since, in 1829, the series was opened by the publication of the first volume of Pfister's *History of Germany*, and the first and second volumes of Leo's *History of the Italian States*; while the volumes issued under the date of 1875, which consist of the fourth volume of the *History of Poland*, by Dr. Caro, and the fifth volume of the *History of Sweden* by F. Carlson, bring the number of the separate volumes up to seventy-three. It was for this series that the eminent historian, the late Dr. Lappenberg, Keeper of the Archives of the City of Hamburg, wrote his *History of England under the Anglo-Saxon and the Anglo-Norman Kings* (translated by the late B. Thorpe), which has since been continued by Professor Reinhold Pauli to the death of Henry VII., and it is to be hoped that Dr. Pauli (who knows more than any foreigner, and all but a few Englishmen, of the history of the internal and external policy of this country) may be induced to carry on his masterly exposition to the later times of the Tudors and Stuarts; but as yet we do not hear that any provision has been made for the further prosecution of the *History of England*, which, like that of Denmark, Italy, and Spain, may, it is feared, remain incomplete.

WE take the following bits of old London gossip from a series of news-letters addressed to Viscount Perceval, now preserved in the British Museum:—

"1 January 1729-30.

"It appears by the Weekly Bill of Mortality that 628 persons were buried last week, among which were three aged between 90 & 100, & one of 102, & one of 104.

"When the Duke of Newcastle was last at his seat in Sussex he sent Coaches for some School Boys from Lewis to act Cato for his Entertainment; and so well approved of y^e performances that he gave the Master a Purse of Guineas & another to the Boys & ordered the Lad who performed the part of Cato to be sent to the University and maintained there at his Grace's expence.

"17 January 1729-30.

"Tis discoursed that a Duty of five shillings will be laid on every Pack of Cards and a Guinea on every pair of Dice, which if true may be of service to great numbers of his Majesty's subjects of the Low Rank, whose Families have too often been miserably reduced by Excessive Gaming.

"5 Feby. 1729-30.

"Yesterday the 4 Highwaymen who robbed the Tunbridge waggon and shott the carrier who dyed of his wounds at Lewisham were taken and committed to the Marshalsea in order to be tried next Assizes at Maidstone. To day the Prince & divers of the Nobility went a shooting in Richmond Park.

"26 Feby.

"Yesterday came on at Guildhall before the Lord Ch. Justice Raymond the Tryall between Miss Holt of Hackney Plaintiff & Knox Ward Chareceux King at Arms Defend^t relating to a promise of the Defend^t to marry her . . . 14 letters from y^e Defend^t were read all of them beginning with Dear Sally & ending with your affectionate serv^t Knox Ward . . . Mr Ward was a fine gentleman of 2000*l.* per annum & of a very fair character . . . The action was laid for 4000*l.* . . . The jury went out for about half an hour and bro^d in a verdict of 2000*l.* damage for y^e Plaintiff.

"16 April 1730.

"Yesterday arrived an Express from Blandford with an acc^t of the Death of the Hon^{ble} Sir Thomas

Pengelly Lord Cheife Baron of y^e Court of Excheq^r, which is universally regretted for his profound learning in y^e Law, and his Impartiality and Justice. He was a Batchellour and Natural Son to Richard Cromwell, son of the Protector of that name.

"31 October 1730.

"The Rev^d Mr Ensden Poet Laureate dying a few days ago at his Living in Lincolnshire 'tis reported as if he will be succeeded by Mr Stephen Duck the Wiltshire thresher whose Poems tho' but lately printed have sold so extraord^y that the 7th edition thereof is now publ^d with some acc^t of his life, particularly that he had little or no learning bestowed on him, however the labour of his mind generally accompanied that of his body, that Milton was his companion both in the field & in the barn, that the Spectators were of singular use to him, & Bailey's Dictionary instructed him in the Signification of words, &c. . . . 'Tis demonstrable he walks in no other stilts than those of his own Genius, w^{ch} renders him the admiration of y^e present age.

"5 Nov^r 1730.

"The R^t Hon^{ble} S^r Rob^t Walpole is expected in Town next week from Norfolk whence we are informed that he keeps open house for all comers & goes at his seat at Houghton, & that the people resort thither from all parts in such numbers y^t 'tis computed his expences amount to near £1500 a week—the whole of which must rise to a handsome sum, but however to no more than what he can well afford."

NOTES OF TRAVEL.

SIGNOR GUIDO CORA, a gentleman of scientific attainments, editor of the Italian geographical periodical *Cosmos*, has been recently exploring some of the less known and brigand-haunted districts of Epirus and Albania. After visiting Yanina he took passage in a Turkish man-of-war for Tripoli, where he collected interesting information on the subject of the caravan routes into the interior across the Sahara to the Sudan. Signor Cora proposes to contribute a detailed notice of his travels to the *Geographical Magazine*.

AMONG notes of travel, the recent exploit of a Russian officer, Captain M. N. Medvedofski, deserves record. This gentleman intends, during the ensuing summer, to follow the example of M. Zubowitz (the hero of the ride from Vienna to Paris), and ride from St. Petersburg to Vienna in twenty-one days at the rate of eighty-three versts *per diem*. In order, apparently, to get his hand in, he has, in company with a subaltern named Vyrodof, undertaken a preliminary ride from St. Petersburg to Moscow (808 versts), a feat which was successfully accomplished in nine days. The horse ridden by Captain Medvedofski was a grey seven-year-old stallion, while his companion rode a bay horse from the Don country. Both the steeds acquitted themselves well, and were not distressed on arrival at Moscow, though the weather had been very severe, fifty degrees of frost having been experienced.

FROM the distinguished reputation of its leader, the approaching expedition of Professor Nordenskiöld to Novaya Zemlya and Siberia promises a valuable harvest of scientific results. After making varied observations in the first-named locality, the Professor will visit the mouths of the Ob and Yenisei, and journeying up one of these rivers, thence return home. Should he find it practicable to join on his work to that of Middendorf at the mouth of the Taimyr river, it would be a matter of congratulation. Part of the Yenisei estuary was surveyed in 1866 by Professor Schmidt; but an examination of the coast line from the Sea of Kara eastward will still be of great service.

AN interesting experiment is about to be made in Sicily. A great similarity has been observed to exist between the soil and climate of Sicily and

Japan, and this has encouraged the Italian Government to make trial of growing the tea plant in the former island. Seeds and full directions for culture have been obtained through the Japanese consul, and the result of the experiment is awaited with some anxiety, Spain and Greece being similarly situated as regards latitude and climatic conditions, and so equally interested in the success of the scheme.

THE writer of an article in Dr. Petermann's *Mittheilungen* on Livingstone's journeys in Africa draws attention to the number of expeditions at present engaged in exploring different parts of that continent. Roudaire, Duveyrier and others are investigating the question of creating an inland sea in Algiers; Largeau, undeterred by the death of Dournaux-Dupère, has started with the hope of gaining the prize offered by the Paris Society in 1855 for a scientific journey from Algeria by way of Timbuktu to Senegal; Savorgnan de Brazza proposes to follow up the work of De Compiegne and Marche along the Ogowai River; Stanley has undertaken a new journey to the equatorial lakes; while Colonel Gordon, with the assistance of Messrs. Watson and Chippendale, Colonel Long and Herr Marno, is in a fair position to examine both the Albert and Victoria lakes. Two expeditions, under the command of Colonels Purdy and Colston respectively, have ascended the Nile, the first with the object of improving the wells and digging fresh ones along the caravan route between Selimeh and Darfur, and thence going on to explore the Sobat river; while the second is instructed to repair to Debbeh in order to see if some directer route cannot be devised between the Nile and Darfur, after which it will assist in surveying Darfur, and from thence, in company with Purdy's party, repair to Fashoda on the White Nile to refit and receive instructions from Colonel Gordon as to their future operations, which will probably include the examination of the Albert Nyanza and the territories adjoining its western bank as far south as possible. A third party, under an engineer named Mitchell, has started from Cairo with the intention of making a geological survey of part of Nubia and the eastern Sudan, between the Nile and the Red Sea, as far as the Sobat river. From the west coast the German African Expedition will shortly make their advance along three lines into the interior, and from the east Lieutenant Cameron has successfully journeyed as far as Lake Tanganyika, the long-disputed question of its outlet being at last set at rest by him.

DR. PETERMANN has published a letter which he has received from Captain David Gray, advocating the old theory of a practicable route to the Pole by way of Spitzbergen or East Greenland. Captain Gray takes particular exception to Admiral Sherard Osborn's emphatic declaration that the idea of an open route to the Pole in the direction of Novaya Zemlya is a mere hypothesis, neither founded on fact nor warranted by experience. He cites various instances of whaling captains and others having seen open water for a considerable distance to the north, and argues, both from this and from his own experience, that after continuous north-east winds the pack-ice is driven off the coast of Francis Joseph Land and the land to the north of it, and that a comparatively free channel will be found under the lee of these islands. With regard to the Greenland route, he urges that the same winds force the ice on to its eastern coast, but that the farther north one goes the more scattered this ice becomes (the process of dispersion being facilitated by an extensive range of ocean in every direction), and that any one forcing his way through this pack will find comparatively open water in the rear.

THE Messrs. Oldenburg, of Munich, have published in a collective form the "Letters from the Libyan Desert," written on the spot for the *Allgemeine Zeitung* by Dr. Karl Zittel. In his introduction the author refers to the mode of their

composition after a long day's march and under all the disturbing influences of camp life as grounds for indulgence on the part of his readers for the haste and the desultory tone which they occasionally display, and with a view of making his narrative as complete and satisfactory as possible, he has appended to the present collection a treatise on the history and early culture of the Libyan oases as still to be traced in their architectural and other remains.

We are happy to hear that the latest communications received from the eminent traveller Dr. Nachtigal announce that a decided improvement has taken place in his health, which enables him to look forward with better founded hopes to the prospect of leaving Africa and returning to Europe in the course of the present summer.

FROM an official report on Tea Cultivation in India, we learn that "there have been lively disputes as to the first discoverer of tea in Assam, and the date of its discovery. It is probable that a Mr. C. A. Bruce, who commanded a division of gunboats in Upper Assam during the first Burmese war, brought down from Upper Assam some plants and seed of the indigenous plant in 1826, and he actually received a medal from the English Society of Arts. But his claim to have been the first discoverer of tea was disputed by a Captain Charlton, who asserted that the existence of tea in Assam had been first established by himself in 1832." However this may be, no immediate advantage was taken of the discovery, nor did it become known until 1834 that "the tea shrub had been found indigenous through a tract of country extending from Suddyah in our territory to the Chinese frontier province of Yunnan." A Tea Committee was appointed by Government in the same year, and "a supply of Chinese tea seed and young plants was also about this time obtained from China, which were found to succeed well in the soil of Upper Assam."

At Niigata (Japan) it seems that the latest rage is one of breeding a kind of gold-fish called *Koi*, whereof the body is white and the head only a light red. A fish a foot long is reported to fetch 35 "yen" (about 71. 10s.). The reason for this extraordinary fancy, we are told by a contemporary in Japan, is that the rumour has been started that gold can be extracted from the scales, and some people have in consequence turned their fields into fish-ponds, and hope to get as much as ten thousand yen from this source.

In a recently published memorandum on the supply of teak and other timbers in the Burmah markets, the Inspector-General of Forests observes:—

"The Cuban and Mexican difficulties gave rise to a sudden demand for the light scented red-wood known as 'bastard cedar' (the *toon* of India). . . . At the same time a close red-wood, *Thitká*, or *Kathitká*, was exported as 'bastard mahogany,' for furniture, and fetched a good price. It has no connexion, as a species, with 'Thitkado,' but is a new species of the *Liliaceae*, given by Kurz as *Pentace Burmanica*. . . . There are red-woods of other sorts; some might be liked better even than *thitkado* and *thitká*. There is the *thingán* (*Hopea speciosa*), a wood heavier than teak, and which lasts under water far better. The *thingán* does not float; but that could be overcome by the use of bamboos. I do not think that it is harder to float than the 'sál' of India. Moreover, it grows abundantly on the Tavoy coast and islands. . . . Again, the wood of a rather common tree, the *Anán* (*Pagrace fragrans*), behaves so well under water that it hardens, and the natives, with pardonable exaggeration, say it 'becomes stone.' Such wood would be invaluable for canal works, piles, &c. Then we have the *padouk* (*Pterocarpus*), a beautiful, hard, heavy wood."

Although it is not exactly connected with the subject-matter of his memorandum, Mr. B. H. Baden-Powell suggests, in conclusion, that there might possibly be a demand for the scented wood-oil of the *Dipterocarpus alata* (Kanyen-sí, Bur-

mese), or for black varnish from the *Melanorrhoea*. "The former," he says, "could be produced on the Mergui and Tavoy coasts in almost any quantity."

EDGAR QUINET AND AMÉDÉE ACHARD.

ONE of the last Irreconcilables died last Saturday. With a mind somewhat mystically bent, with a strong passion for historical research, with nearly all the aptitudes and characteristics of the book-lover and closet-philosopher, Edgar Quinet yet managed to play an active part in the modern political history of France, and to leave an example of constancy to aim and principle which is daily growing more rare among his co-religionists and contemporaries. To the mass of Frenchmen his literary labours are little known: they are too abstruse to appeal to the general public which prefers to learn revolutionary philosophy in the pages of Eugène Sue and the *Misérables*; and in the schools where they might have been useful, his books were long regarded with apprehensive disfavour by the servants of the Imperial scheme of education. Like Littré, Quinet was commonly regarded as the illustrious representative of liberal scholarship, and his mass of erudition chiefly prized for the weight it gave to his political opinions.

Quinet, the son of one of the Revolutionary war commissaries, was born in February, 1803. His studies were completed in Germany, at Heidelberg, whence he returned with an essay on Herder, and a translation of the *Philosophy of the History of Humanity* which immediately secured him so high a place among French *savants* that he was at twenty-five appointed a member of the scientific commission despatched to the Morea in 1828. One of the results of this expedition was his volume *De la Grèce Moderne et de ses Rapports avec l'Antiquité*, a work to which nearly all later writers on the subject, notably About and Flourens, have owned themselves to be considerably indebted. From this moment his productions succeeded each other with marvellous rapidity, the most noticeable appearing in the *Revue des Deux Mondes*, under the titles: "De l'Avenir des Religions," "De la Révolution et de la Philosophie," "Du Génie des Traditions épiques de l'Allemagne et du Nord," "De l'Allemagne et de la Révolution," "De l'Art en Allemagne." Nearly all these works were revelations to the French university world, which had consistently disdained and neglected the results of German research ever since the wars of the first Republic. Some time before this M. Quinet had conceived the idea—if not the plan, for that remained in a very chaotic state—of an *Épopée démocratique*—a species of humanitarian epic such as Hugo has faintly foreshadowed in his announcement of the last part of the *Légende des Siècles*. The famous mystical drama *Ahasvérus* was the first instalment of the *Épopée*. The author announced it as "the History of the World, of God in the World, and finally of Doubt in the World." It excited keen interest, and was promptly interdicted by the Vatican; but reading it for the first time by the light of our own days, one finds it difficult to account for the popularity, if not for the papal embargo. As a theological essay the work is vague, and occasionally puerile; as a poem it has about the same merits as the *Henriade*—that is to say, the merits of a narcotic. Indeed, its chief component parts might be aptly defined as the poetry of Voltaire's epic and the theology of *Festus*. It was followed by two more democratic poems, *Napoléon* and *Prométhée*. The Napoleonic epic was subsequently illustrated and explained by a prose work—*Le Champ de Waterloo*.

It is by these anti-Imperialist writings that the "Father of Democracy," as M. Gambetta has somewhat grandiloquently called his friend, exercised the deepest and widest influence on the French nation. He was the first historian who ventured to lay sacrilegious hands on the Colonne,

the little cocked hat, the camp bed, the *redingote grise*, all the august symbols of Imperialism that appeared destined to enter into the traditions of the French people like Roland's Durandal and the white crest of Navarre. He was the first to show a glimpse of Caesar without the hat and without the *redingote*, scoff at him as a vain homunculus, and sharply criticise him as a general. There was originality and audacity in such an enterprise undertaken at such a time. It was an attempt to separate Liberalism and Bonapartism which took many sincere democrats by surprise, and doubtless won over not a few Philippists, in spite of the vigorous attacks the author was continually making against the Constitutional régime as practised by M. Guizot. At any rate, in 1842 M. Quinet obtained a seat at the Collège de France as Professor of the Literature and Languages of Southern Europe. He used his tribune as a standpoint from which he might hurl denunciations at the Jesuits' pulpits. With Michelet he was the most determined hater of secret priest rule, and the two together made an eloquent plea for secular education in the famous work *Les Jésuites*. The Government prohibited Quinet's lectures in 1846, and having been elected deputy in the following year, he retaliated on the Government by preaching loudly and eloquently the popular doctrines of electoral reform. He took part in the street war of 1848, and "inaugurated the Republic at the Collège de France in the seat of one of the King's readers." Subsequently he naturally took an important and energetic part in the labours of the Constituent and Legislative Chambers, where he consistently voted with the Extreme Left. His works during this period were *Les Révolutions d'Italie*, *La Croisade autrichienne, française, napoléonienne et espagnole contre la République romaine*; *L'Etat de siège*, and other political pamphlets. He was expelled from France at the time of the *coup d'état*, with Victor Hugo, Louis Blanc, and other leaders of the Left, and, like them, he refused to avail himself of the general amnesty of 1859.

M. Quinet wrote in Brussels, where he took refuge, a number of political *opuscula* and a few works of permanent importance, such as *The Foundation of the Republic of the United Provinces*, *Philosophy of French History*, *La Révolution religieuse au XIX^{ème} Siècle*, and *Merlin l'Enchanteur*, a philosophical allegory. His later life is sufficiently well known. His work, *La Révolution*, was issued in 1865, and reached a fifth edition in three years. He returned to France at the downfall of the Empire, and was the third on the list of Radical members for Paris. There are a number of interesting details concerning his life and works in the *Souvenirs d'Exil*, published a year ago by his wife, the daughter of the Moldavian poet Assaki, whom he married at Brussels in 1854.

M. Quinet was a mediocre orator. His political foresight was quick but not remarkably profound. He will be chiefly remembered as one of the first assailers of the *Légende Napoléonienne*, and as the writer who has done most to familiarise the French mind with German culture in literature, art, and science. He was preparing an important historical work when he died.

By the death of M. Amédée Achard, French provincial circulating libraries have lost one of their most respected purveyors. You see his name at every page of the dreary dog-eared catalogues of Contentin and Carpentras—where there is not Alexandre Dumas (an appalling enumeration one always skips), there seems to be Amédée Achard. He was one of those workers in the field of fiction whom the indulgent critic, averse to breaking butterflies, invariably calls "prolific" and "laborious." The terms were certainly merited in the case of the author of *Belle-Rose*. From the date of his first contributions to the *Sémaphore de Marseille* to that of his death, last week, his pen was incessantly at work. Born at Marseilles in 1814, M. Achard at first followed the tradition of his family and engaged in com-

mercial pursuits, which led him, at the age of twenty, to Algeria, as the founder of an important agricultural enterprise. This, however, he abandoned in a year, to become the *chef de cabinet* of the Prefect of the Hérault, and subsequently to try his fortune in Paris. He became a contributor to *Vert-Vert*, a small satiric journal, the *Charivari* and the *Entr'acte*. Later on we find him writing "Courriers de Paris" and "Lettres parisiennes"—that sempiternal resource of literary mediocrity—in the new *Epoque*; and in 1846, with Alexandre Dumas (who attracted more attention than the prince), he accompanied the Duc de Montpensier to Spain as historiographer of the royal wedding festivities. On his return *Belle-Rose*—his masterpiece—was published, and the author was decorated. Like nearly all his colleagues of the *feuilleton* and the one-franc sensational novel, M. Achard attempted to make capital out of the Revolution of 1848. He espoused the cause of "Order" as a royal historiographer was bound to do—unlike Alexandre Dumas, who boasted in his *Mémoires* that the dethronement of Louis Philippe was one of the eight hundred works of the author of *Monte Cristo*. Both Achard's brothers were killed at his side on the barricades. In 1849 M. Achard attached himself to the *Assemblée Nationale*. There he published his historical romance, *La Chasse royale*. In the following year the most curious episode of his life occurred. M. Fiorentino, a Franco-Neapolitan critic and dramatist, had undertaken some literary enterprises which drew upon him the censure of the *Société des Gens de Lettres*. A sharp quarrel ensued, at the end of which Fiorentino announced his intention of exterminating the *Société* one by one in alphabetical order. M. Achard's unfortunate name rendered him the first victim. He was very grievously wounded by the critic; but the *Société* was thenceforth left in peace.

M. Achard wrote several pieces, among which *Par les Fenêtres*, an amusing farce, and *Souvent Femme varie*, a poetical drama, are the most often played. His principal romances are *Les Petits-fils de Lovelace*, *La Robe de Nessus*, a tale of fashionable Parisian life, the *Clos Pommier*, *Les Vocations*, *Noir et Blanc*, *La Traite des Blondes*. His last work, *Souvenirs d'Insurrections*, is an interesting account of the recollections of a man who had passed through three revolutions and half-a-dozen popular risings. Octave Feuillet has been called the "petit Musset des familles;" M. Achard might be defined as a Dumas revised and chastened for the use of boarding-schools.

EVELYN JERROLD.

GEORGE HERBERT'S PRESENTATION TO BEMERTON.

EVERY admirer of George Herbert is well acquainted with Isaak Walton's charming story of Herbert's presentation to Bemerton, and knows how in April, 1630, the King with Laud and the rest of the Court was at Salisbury or Wilton, how Laud with great difficulty persuaded Herbert to accept the living, and how to strike the iron while it was hot, a tailor was sent for from Salisbury to make a suit of canonical clothes for the incumbent. To anyone acquainted with the period there is something very suspicious in the story. Charles was not accustomed to go on progress in April, and in that particular year both he and Laud can be shown to have been in London on some days in April. Curiously enough the story finds its refutation in the original presentation which was long ago printed from the Patent Rolls by Rymer (xix. 258), from which it appears that the presentation was made out on April 16 at Westminster, not at Salisbury or Wilton. Moreover Herbert is there described not as "clerk" but simply as Master of Arts, from which it follows that he was a layman when presented to Bemerton, in spite of Walton's statement that he had been ordained a deacon some years before. Mr. Grosart's belief that he was a layman when he received the Lincoln prebend is thus more than justified.

Though the details of Walton's story fall to the ground, the essential part is made more probable than before. Substitute a London for a Salisbury tailor and there is no further difficulty.

SAMUEL R. GARDINER.

THE RUSSIAN REVOLUTION OF 1762.

THEODOR VON LUDERS was the Russian chargé d'affaires at the English Court during the reigns of Peter III. and Catherine II. Some of his papers recently came into my hands, and on looking over them I found the following account of the Russian revolution in June 1762, in which Peter was deposed. The original is in Spanish, and is entitled "Relacion de la Revolucion de Rusia sucedida en el dia 9 (28) de Julio (Junio) de 1762 y Siguientes en que fue destronado el Emperador Pedro terzero por su esposa la Emperatriz que subio al trono con el nombre de Cathalina Segunda."

There is also an English translation, from which the following is printed. It seems to be an account by some Spanish official of what actually took place, and it differs in some respects from the account given of the revolution in the *Annual Register* for that year:—

"On the 9th July (28th June) at about eight in the morning, the Empress arrived here incognito, in a chaise drawn by two horses, accompanied by two subaltern officers and a female attendant, from the town of Peterhoff, where 'tis said she had been confined in her palace since the night of the 7th, whence she escaped by a window; she stopped at the quarters of the regiment of Ismaolefski Guards, of which the Hetman is colonel, thence she went to those of Preobrasinski, then to the regiment of Horse Guards, of which Prince George is colonel, afterwards to the corps of artillery, and then in succession to the rest of the troops. She convoked the Synod and ecclesiastical body, with other persons of distinction, and in the church of Casan, which is the principal one, everything necessary was prepared for Her Majesty to take the usual oaths.

"This church is in the street in which I reside; such sudden and important events and their novelty caused a confusion not to be described. About nine or ten in the morning, I observed an extraordinary uproar and noise; waiting the event, I saw the regiment of horse-guards, hurrying without order towards the Summer Palace, which is in front of my house, and is the residence of the Grand Duke Paulo Petrowitz. They surrounded the troop assembled to relieve guard there; this was done so quickly that they overturned each other, many men and horses fell down and were run over; most of the men were uncombed, others half dressed, and many without hats. With the same haste they entered the palace, and not finding room through the gate, they tore away the garden fences, which were of wood, entered, and surrounded the palace.

"At the same time, and with the same haste, the foot guards passed by my house and the adjoining streets, followed by some ammunition waggons; the men were all uncombed, some without hats, hair in disorder, without shoes or gaiters, and some without uniform; but all had muskets, bayonets, sabres, and cartouch boxes; many loaded on their way; others to save time seized on the carts and waggons of the peasants which they found in the streets, and got into them; all appeared in high spirits, and proceeded towards the Stone Palace; a great number of workmen, mechanics, and peasants, armed with axes, also assembled themselves about the church of Casan and the palace.

"Whilst the guards were doing this, an old Berlin and four badly caparisoned horses, with two postilions, and a servant in lead-coloured liveries, apparently belonging to some officer, came out of the garden gate of the Summer Palace, at about half-past ten o'clock, surrounded by 500 horse guards commanded by Colonel Melesins, lieutenant-colonel of the bombardiers of artillery. In the Berlin was the Grand Duke in a cap and undress, accompanied by his tutor, General Panin, and by the Chamberlain Teploff, who conducted him to the church of Casan, where the Empress was waiting for him; after the oaths had been taken, they went out in an old coach, drawn by two bad white horses. Her Imperial Majesty and His Highness were accompanied by Count Rozamusk,

Hetman of the Ukraine, the Director-General of Artillery Villebois, and some others.

"In this manner the Empress and her son arrived at the new Stone Palace. In the great square in front the foot and horse guards were drawn up. The Empress was acknowledged Sovereign of all the Russias, and the Grand Duke as her successor, by the generals and other great officers of state in the accustomed manner and with the usual ceremonies.

"Leaving the palace, they then presented themselves to the troops, were joyfully proclaimed, acknowledged, and sworn to in due form—which was followed by reiterated *vivas* and acclamations from the people. In the meantime, at about 12 o'clock, a regiment of Cuirassiers, completely clothed and armed but without gupuras (cruppers), passed at a quick pace from its quarters, through the Perspective street in front of my house, towards the Palace square, to perform the same ceremony, and at half-past 12 o'clock a piquet of the same regiment returned for its standards which were in the Summer Palace, whence they carried them to the new Stone Palace: and the same was done by all the others. Te Deum was then sung in the chapel of the palace, and the Empress and her son conducted in a rich carriage to the Winter Palace, where they remained the greater part of the day exposed to public view, seated in a window looking to one of the principal streets.

"As yet nothing unfortunate has occurred, both army and people manifesting the utmost pleasure and even in the countenances of the poorest peasants there appeared satisfaction. The Empress harangued the troops, nobles and people, promising them a peaceful reign resembling that of the Empress Isabel. Prince George of Holstein was arrested by an officer of his own regiment, in defending himself he was wounded; and was afterwards placed in a calash, surrounded by soldiers, and secured in one of the rooms of the palace, whence he was taken to his own house under a strong guard, which remained there.

"The same fate befell the Prince of Holstein Beek, Governor General of Petersburg and 'tis said some others. The Lieut' General of Police Baron Corf upon being arrested immediately joined the new party, and the Empress returned him his sword with her own hands.

"The necessary precautions in cases of a similar nature were now taken; the palace was filled with troops and artillery, and the streets leading to it; a battery of 12 guns was placed in the square, not far from the Summer Palace opposite my house, to command the avenues to the road from Moscow. But it was afterwards withdrawn to go to Oraniemboon where the deposed Emperor had retired with the Holsteiners and some other troops which had joined him.

"Between 9 and 10 at night the Empress mounted on horseback, dressed as a man, in the uniform of her guards, wearing the ribbon of the order of St. Andrew, and heading her troops on their march towards Oraniemboon.

"The manifesto published sets forth, that the Empress ascended the throne at the invitation of the people, and deposed the Emperor for despising religion, for the dangerous innovations he wished to make, and for the shameful peace he had just concluded with the bitterest enemy of the nation, Prussia, despising and sacrificing the glory acquired by its arms, and for totally changing the state contrary to its constitution, good customs, uses, and common weal.

"The ascent of the Empress to the throne was notified to the foreign ministers the same night. It is said by some that between 9 and 10 o'clock on this very night the Empress was to have been carried from Peterhoff, where she was confined, to a convent, and that her son, the Grand Duke Paulo Petrowitz, who had remained in the Summer Palace of this city, was to have shared the same fate. That in the morning the Emperor would have repudiated her, and at the same time taken the Camerfrauen (Lady of the Bedchamber) Isabella (Elizabeth) Countess Woronzou for his wife and Empress. The chief promoters of the revolution were Count Rozamusk, Hetman of Ukraine, General Villebois, commandant of artillery, Prince Wolkowsky, who concluded the armistice on the 16th March of the present year with the King of Prussia, the chamberlain Iwan Iwanitz Schwalof; General Panin, tutor to the Grand Duke; the family of Orloff and the Princess Daesocoff (Dashcoff), sister to Countess Woronzow, the above-mentioned Lady of

the Bedchamber. With respect to this Lady, the principal person employed in this intrigue, she is of very different mind. Not yet twenty years old, but has extraordinary abilities. She rode at the side of the Empress on horseback on her march to Oraniemboon.

"The plot began to be known by the treachery of a soldier, and upon his information on the part of the Czar, there was order given to examine one of the chief confidants of the Empress, an officer of the guards named Passicoff. This circumstance, and the moment being most favourable from the circumstance of the troops being well disposed (the first battalions being ordered to join the army, which they did with great reluctance), caused the springing of the mine and hastened the enterprise, the execution of which took place in the above-mentioned manner.

"10th July (29th June). It was known this evening that the Empress had remained in Krasnakabak till four in the morning, and thence went to Strelina Muica, whence she sent a body of troops to seize on the person of the deposed Czar: upon its arrival the greatest part of the Russians abandoned him and joined her troops. He seeing himself without resource took the opinions of the principal persons of his party who had remained with him, amongst whom was Field-Marshal Count Munich, and it was decided that he had no choice left but to submit his fate to the mercy of his enemy, which would then be less severe. This he acceded to, asking for life, a pension, and liberty to retire to Holstein with the Countess Elizabeth (Isabel). He acknowledged the Empress as his sovereign, and sent her his sword; to this some particulars are added, which at present it is not easy to relate.

"General Count Viere was arrested at Cronstadt, where he went on the part of the Emperor to gain the fleet and port to his side, but the Admiral Falitzin arrived at the same time with the orders of the Empress, which were obeyed. Cronstadt is an island opposite Oraniemboon at about half an hour's sail from it.

"We have heard the cannon of Peterhoff; 'tis said to be a salute in honor of the day. The Empress is now there.

"The declaring herself Colonel of the Regiment of Horse Guards, appointing Prince Wolkonski her lieutenant-colonel, and the recall of Count Bestucheff Rurain (formerly Chancellor) from banishment, are her first acts.

"The foreign ministers and all the Court had been invited yesterday to Peterhoff, there to remain until the 11th, for the ceremonial of the feast of St. Peter and St. Paul, in consequence of which the deposed Czar at that time, ignorant of what passed in the capital, came from Oraniemboon to Peterhoff between 11 and 12, with the greatest part of his court: finding the Empress was not there, he began to take precautions, although uncertain of what would happen; he sent orders to St. Petersburg, but as the bearers arrived in the city they either joined the new party, or were taken to the fortress or other places of security; finding himself without resource, he returned to Oraniemboon, assembled his few remaining troops, did as has been related, and intrenched himself.

"To understand these movements you must know that the distances from Petersburg to the above-mentioned places are to Peterhoff 30 wersts (wursta), to Oraniemboon 10 wursta, and something more: to Krasnakabac, which is an inn, 9 wursta, and Strelina Muica, the royal fortress, is 7 wursta from Peterhoff towards Petersbourg. Four or five wursta make one of our leagues.

"11th July (30th June). This morning the Empress returned in triumph to the city, which she entered on horseback, preceded by the cavalry and followed by the infantry; at about 12 she arrived at her Spring palace, which, as I have before said, is opposite my house. On the staircase, all the court waited for her, a general kissing of hands took place; Te Deum was sung in the chapel, and her majesty retired to her chamber. Some particular circumstances have come to light. The deposed Czar embarked in a galley, and presented himself before Cronstadt, but it was of no avail; he was threatened and obliged to withdraw; finding himself abandoned, he saw himself under the necessity of renouncing his rights and surrendering himself.

"At 11 o'clock on the night of the 11th he was conducted to the Fortress of Petersbourg.

"It is not certain that the Empress was arrested

On the night of the 7th at Peterhoff, but this was to have taken place on the 9th.

"To-morrow morning, when there will be less confusion, you shall know the measures which this unfortunate Czar designed to take, the letters he wrote to the Empress, together with this heroic Sovereign's first proceedings, and other various circumstances."

The Empress in her manifesto states that the Czar begged her to allow him to withdraw to Holstein with Elizabeth Worontzoff Gowdowich. This lady, the Czar's mistress, to whom allusion is made in the above account as the person Peter was about to marry when he had got rid of Catherine, seems ultimately to have been treated by the Empress with greater leniency than might have been expected, for among M. Luders' papers I find a letter from Count A. Worontzoff to him, enclosing a copy of the following letter from the Empress:—

"M. Le C^{te} Worontzow vous ne vous êtes point trompé en croyant, que je n'avois point changé de Sentiment pour vous. Je lis avec plaisir vos relations & j'espère que vous continuerez la conduite louable que vous avez eue jusqu'ici. Vous devés être rassuré sur le sort de votre Famille, sur laquelle j'ai vu toutes vos inquiétudes. Je suis fâchée d'avoir été obligée de vous les donner. Je changerai en mieux la situation de votre Soeur La Comtesse Elisabeth, le plutôt possible. Je vous remercie du Livre, que vous m'avez envoyé & je serai toujours votre très affectonné CATHÉRINE.
"à St^{pe} le 13 août, 1762."

J. W. WILLIS BUND.

LETTER FROM PERSIA.

Teheran : January 27, 1875.

Among the many schools which Persia has, there is one which has made remarkable progress within the last few years. The school in question is the Royal College here, the Medresseh i Dār ul fenūn. Last Thursday we were enabled to witness in the courtyard of the college the presentation of prizes by the Shah to the heads of the college, the teachers and the pupils. We, who had not seen the college for the last six years, were greatly struck with the immense progress that has been made since then; and to judge from the Shah's pleased and delighted countenance during the whole ceremony, he has, no doubt, also noticed the progress. In the ancient days of which we speak, that is, six or seven years ago, the college was altogether a farce, and that a very disgraceful one. There were teachers who taught nothing to the pupils for want of knowing anything themselves, there were others who hardly deigned ever to go to the college at all, and others who taught themselves at home the easiest and shortest ways of getting through a bottle of brandy or arrack; there were also one or two teachers who worked conscientiously, but who never received any thanks or reward. They were all badly paid, and often received no pay at all, or got it one or two years after it was due. The students did what they liked, and considered the college as a sort of select and exclusive playground. The teaching was pursued in a most absurd and unmethodical manner: a Frenchman taught English, the French teacher knew no French, the teacher of physics and chemistry was innocent of any knowledge of those sciences; the only classes that were at all useful were those of joinery and tailoring. The professor of the former was a Persian who had been two years in Paris, the professor of the latter an Armenian.

The college at present contains nearly two hundred students, who are uniformly dressed in black cloth tunics and trousers set off by gilt buttons and red stripes, and about twelve teachers pretty well paid and mostly doing their work. There are classes for the English, French, and Russian languages, for Chemistry, Physics, and Medicine, for Infantry, Artillery, and Military Engineering, for Drawing, Painting, Mathematics, Geography and a few other subjects. The Persian boys have an extraordinary capability of acquiring a superficial knowledge of any subject in a very

short time. We spoke French, on easy subjects, of course, to a young prince, sixteen years of age, who had studied that language for one month; he replied, almost fluently, making only a few mistakes. This boy, if he had continued his studies, would in a short time speak French very well; his marriage, however, a short time ago, put a stop to his linguistic studies and set the cares of a household in their place. Many boys learn a language for a few months, and then leave it for something else; they seldom persevere in any one thing, a superficial knowledge being all they want and all they are required to have. One of the Shah's interpreters or translators—one of the best—does English, French, and German in quite an offhand way. He speaks these languages with an astonishing volubility, and hardly gives one a chance to detect errors; but he cannot write them. We knew two little Persian boys who had been two months in Bombay; they returned speaking English, and one of them could read easy tales in English.

Last Thursday's ceremony was one which happens only once every two or three years. The students were drawn up around the courtyard with the teachers at the head of their classes. The Shah sat in a verandah, having near him his ministers and some high officers. Before the Shah, a few paces distant, stood a table on which were piled the different prizes. Close to the table stood the Minister of Sciences, Ali Kuli Mirza Itzād us Sultaneh, and the Director of the College, Jaffer Kuli Khan. The Minister handed the prizes to the different recipients; the prizes consisted of copper, silver, and gold decorations, medals and stars, bags filled with various sums of money from twenty to four hundred krans (sixteen shillings to sixteen pounds), shawls, &c. The Minister read something to the Shah, and the students were then marched up; some of the boys brought specimens of their writing or drawing, which were handed to the Shah. Everything he saw was "very good;" it was evident that His Majesty was pleased. Many of the students received diplomas giving them the right of drawing a salary in future; the shawls and larger sums of money were given to the teachers. Some of the latter received the orders of the Lion and Sun with accompanying military rank if they were officers, the order only if they were civilians; the Professor of Geography was made a general of the second class—certainly a grand way of rewarding a teacher of geography. Out of the whole number of students only two unfortunate individuals did not receive a satisfactory reward; they were marched off to prison, and have probably by this time received a bastinado. Excepting these two everybody was content and happy; students, teachers, servants, gardeners, all had received something. It was then the turn of the Director and the minister and some princes to be rewarded; they received handsome sums of money, several hundred pounds sterling, and magnificent overcoats and mantles made of fur-lined cashmere. Ferhad Mirza Muatemed ud-dowleh, the Regent while the Shah was in Europe, received one of these mantles, called khirkeh; he put it on at once; it was so thick and voluminous that it changed him from a prince into an unrecognisable conical bale of cashmere shawl with a little black hat at the apex. At three o'clock the table in front of the Shah was cleared of the prizes it bore, and the ceremony ended.

Last night was celebrated the marriage of one of the Shah's daughters with the Imām Jumeah of Teheran. The bride is not very young, twenty years of age nearly, and the Imām Jumeah cannot be more than thirty-five. The popular opinion here is that the marriage is simply another link of the chain with which the King tries to attach himself to the priesthood. The happy pair, it is said, have expressed a mutual dislike and aversion to each other; this, however, is very improbable, but shows what the people think of the marriage. The bride, veiled and

covered with what looked like a waving mass of molten gold, was taken to her husband's house at half-past nine; soldiers with candles in the muzzles of their guns lined the road, the walls of the houses were illuminated with oil lamps, and as the princess left her father's palace guns were fired and fireworks let off. The fireworks went off very well with but a few exceptions; on the roof where we had taken up our stand some hundreds of rockets suddenly burst off in all directions, burning many of the spectators, and some guns and stars exploded just as the bride's carriage was passing, frightening the horses and burning the uniforms of many soldiers and servants. To-day a grand salvo of artillery was fired off, and some festivities took place in the great square.

From the South the news is not very cheering. Very little rain or snow has as yet fallen in Fars, and the prices of grain and bread have risen considerably. If rain or snow does not soon fall, great dearth of provisions, if not another famine, may be expected. At Shiraz the Governor, Hissam us-Sultaneh, is continuing his extermination of the robbers who during the reigns of the governors before him infested the whole province. During the last six weeks he has had twenty bricked up, and beheaded five. He has yet a number of robbers in the prison to be executed shortly. The Hissam us-Sultaneh is the right man for Fars; if he had not been appointed Governor of that province, there would have been by this time more robbers in Fars than peaceable people.

CORRESPONDENCE.

THE BHAKHUT SCULPTURES.

38 Chancery Gardens, W.: March 25, 1875.

The principal interpreter to the Ceylon Government, Louis de Zoysa Mudliar, writes me word that he has found the Pali version of the story of the Nāga-king Erapātra, in the commentary on v. 182 of the Dhammapada. The beginning

and end of the comment is given at p. 344 of Fausbøll's Dhammapada, but the story itself is unfortunately omitted. The Mudliar writes:—

"The legend as given in the commentary clearly explains the sculpture. Mr. Fergusson's opinion that the tree which Erapātra is worshipping is not the Bo tree of the last Buddha, but one of a totally different species, turns out to be perfectly correct. I may be permitted to add that the Nāga-king is not worshipping a tree, but Buddha—the Bhagavat. It is stated in the legend that Buddha went to a place called the Seven Sirisa trees (*sattā sirisarukkā*), and received the salutation of the Nāga-king seated at the foot of one of these trees. So that the tree which Erapātra is apparently (though not really) worshipping must be a Sirisa tree (*Acacia Sirisa*)."

We have here a striking confirmation of Mr. Beal's theory that the Nāga-king is worshipping an invisible Buddha seated beneath the tree. I cannot forbear quoting the words of his letter in the ACADEMY of December 5, 1874 (p. 612):—

"... The more I study these groups, the more I am convinced that the altar, so called, represents the seat or throne on which Buddha was seated under the Bo tree when he arrived at complete enlightenment, and that the people engaged in worship are in fact worshipping Buddha, although not represented by any figure; for we know no figure was made of him for some centuries after the rise of his religion."

As regards the inscription which accompanies the bas-relief, I must of course abandon the emendation by which I proposed to insert *bodhim* after *Bhagavato*. There then remain two alternatives: either there is a grammatical error in the inscription, or the word read *Bhagavato* should be *Bhagava(n)tam*. A rubbing of the inscription is a great desideratum. R. C. CHILDERS.

"A GOLDEN VERSE."

Ducklington Rectory, Witney: March 27, 1875.

The lines noticed in the ACADEMY of March 20 by your correspondent, Mr. Peacock, will have some additional interest for him, I presume, when he is informed that they are traditionally assigned to his namesake, Bishop Reginald Peacock. They are often found in MSS., and have frequently been printed with verbal variations; e.g. two versions in Wright and Halliwell's *Reliquiae Antiquae*, vol. i. pp. 127, 207; in the Camden Society's *English Chronicle from 1377 to 1461*, edited by the Rev. J. S. Davies, p. 77; and in the Preface to Peacock's *Repressor*, vol. i. p. liv., where the editor, Mr. Churchill Babington, impugns their supposed authorship. W. D. MACRAY.

MRS. KINGSFORD'S "ROSAMUNDA THE PRINCESS, AND OTHER TALES."

Hinton Hall, Shrewsbury: March 20, 1875.

The notice of my book in your last issue proves that the practice of signing literary critiques is no guarantee against unscrupulous misrepresentation. While I am sorry to make you responsible for your reviewer's violation of the trust you have reposed in him, I am compelled in justice to myself and to my publisher to demand from you the amplest reparation it is in your power to give.

Your critic commences by quoting a portion of a sentence as if it were the whole, in such a manner as almost to reverse its actual meaning. The sentence in question stands thus in your pages:—

"She (the author) gives us her conception of 'a true strong-minded woman, not the less a woman because so unlike the feminine portraiture of our emasculated times, but such as the return of virile strength to the heart of our palsied world may again bring forth in the good days to come.'"

As given in the book itself, there is a comma and not a full stop after the word "come," and the sentence concludes, "but then with purer and higher aspirations than were possible to the pagan Rosamunda." Nor is this the only important suppression in the paragraph; four entire lines of similar qualification have been omitted without a word of explanation, and in order to construct

the sentence held up for reprobation, two different paragraphs have been laid under contribution (p. 81).

Your reviewer continues:—

"If the palsied world could produce her now, Mrs. Kingsford would claim Parliamentary franchise for her. 'The hard, selfish, grinding laws made by men, and particularly the laws relating to marriage, divorce and the conjugal rights' would then be speedily amended. The Seventh Commandment would cease to hamper the truly strong-minded. The rest would be in force against husbands alone. Deceased wives' sisters would rejoice, and the golden age return. 'And first to know and to herald its coming would be the wild birds of the air, Nature's poets, types of the singers and missionaries whose voices warn the world, whose spirits float on wings of freedom, untamed and unafraid, the ichor of whose wondrous strength is the pure element of the open Heaven.' Thus does Mrs. Kingsford read the history of the past, and foretell the history of the future."

Will it be believed that the first of the above passages in inverted commas, is purely an invention of your reviewer's? Neither in my book nor out of it have I said a word in favour of the revolting doctrines thus imputed to me. The second quotation is made from the end of a chapter in which I describe the decay of paganism and the dawn of Christianity; and so far from exulting in the advent of an era of increased licence, as stated by your reviewer, it refers solely and distinctly to the approaching triumph of the faith of Christ!

No one judging by your notice would suspect that six-sevenths of my book are occupied with stories of a high religious character, and that at least one of my objects—as intimated in the preface to *Rosamunda*—was to contrast the character of Pagan with Christian times, and to show the spiritual advance achieved in the latter from the age "when womanhood knew no softness, and manhood no remorse" (p. 4).

In short, the review is in almost every line a cruel personal attack, highly injurious to me as a writer and a member of society, and as utterly unfounded as it is wanton and unprovoked.

NINON KINGSFORD.

FYE-MARTEN.

3 St. George's Square, N.W.: March 27, 1875.

Ignorant guessing is the curse of etymology; and a more conspicuous instance of it I have seldom seen than the statement in the last ACADEMY, March 27, p. 325, col. 1, that the French "*Faine* in English became *foine*; and *foine-marten* was in Yorkshire corrupted into *foul-mart* or *foumart*." Still, the absurdity of the change of sounds is equalled by that of the change of sense; for we are asked to believe that the French name *foine* (*foinnee**) of a sweet marten, the Beech-marten (*Mustela Martes*, or *foina*), was transferred to the English foul marten, the French *putoris* (*Mustela putorius*).

The Early English name is seen in the Promptorium of ab. 1440 A.D.† "FULMARE, best (fulmard H.P.) *Poooides*, Dico. *fatontus*, *pator*;" and in the Catholicon Angl. "A fulmard, *fatontus*." Mr. Way notes also that "The Acts of James II., King of Scots, A.D. 1424, regulate the export of '*foumartis* skinnis, callit fithowis.'"‡ The animal was named from its smell, as the German *stinkmarder* shows; and the English *foul*, *fau*, is assuredly the Anglo-Saxon *fūl*, foul, and has nothing whatever to do with *fagina*, or with *foine*. The *mard*, *mart*, of *fulmard*, *foimart*, is the Anglo-Saxon *meard*, *meard*, a marten, *pelosset* (Boesworth).

What the derivation of *fye* is, cannot be settled till we have other and earlier instances of the word; but as it evidently has a bad meaning—not that of the name of the other marten, the

* Diez, in his 2nd edition, derived this from G. *feh* Goth. *faih* (variegated, &c.).

† Stratmann also refers to Marriot's *Miracle Plays* p. 8.

‡ (F) *Fichowis*, *fichowis*.

"sweet-marten"—one possibility is that its source is onomatopoeic:—

"Pie! W. fi! Gael. *fich!* Bret. *fech!* Fr. *fi!* G. *fi!* *pfui*, Lith. *pu!* Illyrian *pi!* Sw. *tui!* Interjections of reprobation, originally expressing disgust at a bad smell or offensive mouthful. See Faugh!—Wedgwood.

But this is mere guess.

F. J. FURNIVALL.

P.S.—Shakspeare's contemporary, Topsell, gives *Fiechtmarder* (German *fichte*, pine) as one of the names of one of the two German divisions of the "Marder, Martel, or Marten." I some time since suggested this *fiechtmarder* as the possible source of *fye-marten*, if it meant a pine marten. But I see no reason to believe that our *fye* was imported from Germany or France.

THE POSTULATES OF THE SCIENCE OF SPACE.

11 Norfolk Road, N.W.: March 29, 1875.

In an interesting article on the Postulates of the Science of Space in the February number of the *Contemporary Review*, Professor Clifford analyses our conceptions of Space, and puts forth certain opinions as to its nature and extent. As the subject is intimately connected with General Philosophy and Metaphysics, I may, perhaps, be permitted to point out why the arguments he advances in support of some of his statements do not seem to me conclusive. Referring to a spherical surface as possessing the property of superposition, in virtue of which a figure may be drawn on any part of it equal in all respects to a figure drawn on any other part, he states that this property of the surface "does not depend in any way upon its relation to space of three dimensions." I do not see how this statement is consistent with the known fact that the property in question depends upon the uniformity of the curvature of any surface that possesses it; for the curvature of a surface at any point is one of its relations to space of three dimensions, since it depends upon the curvature of what are known as the principal normal sections of the surface at the same point, that is, upon the rate at which these lines change their direction—not in the surface—but in planes perpendicular to it at the point; in other words, in the solid space in which the surface lies. Professor Clifford supports his statement by appealing to the fact that a flexible surface possessing the property of superposition can, without losing it, be altered in shape in all manner of ways by bending and pulling it, provided it is neither stretched nor torn. Now if the alterations in shape which the surface can thus be made to undergo were quite arbitrary and subject to no condition of constraint, we might infer that the property of superposition was independent of the curvature of the surface, and consequently independent of the surface's relation to solid space, so far as curvature is a relation. But the alterations are not arbitrary. According to Professor Clifford's own limitation, they must be such as are consistent with not stretching or tearing the surface; consistent, in other words, with retaining the curvature the same after, as before, deformation, consistent with retaining this relation of the surface to solid space unchanged. In truth the fact he appeals to, the fact that a flexible and inextensible surface can be made to assume a variety of shapes, that is, vary its relations to surrounding space in a variety of ways, and yet retain one of these relations—curvature—unaltered, is a remarkable consequence of this relation being a relation between a surface and solid space. A plane curve cannot, like a surface, be deformed consistently with keeping its curvature unaltered at all points. Its curvature, or rate of change of direction, is a relation it has with a mode of space in which the aggregate of directions is only of one dimension, and its measure depends on the length of a single line, the radius of curvature. The condition, therefore, of unaltered curvature is one of perfect constraint, admitting of no change in the line's shape. But round any point in solid space the aggregate of directions is

of two dimensions, and the curvature of a surface at the point depends upon the product of two factors, namely, the curvatures at the point of the two principal normal sections passing through it, that is, the rates of change of their directions in the space of three dimensions in which the surface lies. Consistently, then, with retaining the curvature of the surface unaltered, these curvatures can vary, but not in an arbitrary manner, independently of each other, since their product must remain unchanged. Hence the possibility of varying the shape of a surface without altering its curvature. When such variation of shape takes place, the curvatures of the principal normal sections are altered, but their product remains the same, and this condition is the constraining condition that limits the freedom of the surface as to the shapes it can assume. Under these circumstances it can scarcely be maintained that the property of superposition is one of the properties of a surface "which are absolutely independent of the existence of any points which are not upon it." On the other hand, it is absolutely independent of position on the surface that possesses it. A moveable figure fitting over any part of it could be moved over the surface with perfect freedom, and if one of its points were fixed, it could revolve in the surface round this point till it came back to the position it started from. Thus proving that its form and magnitude are independent of its position on the surface. In these respects the surface is analogous to our space of three dimensions, in which a solid body can move with perfect freedom, and can revolve round two fixed points until it comes back into the position it started from. Nevertheless, we can, from these facts, draw no inference as to this quality of superposition, possessed by our solid space, being intrinsic and independent of space of higher dimensions than three, if such exist. Indeed, reasoning from the analogy of surfaces, we might rather come to an opposite conclusion. It is possible that the geometry of space of three dimensions possesses the character it does possess, not because it is a part of the internal economy of such space absolutely independent of any relations it may have with space of higher dimensions outside of it, but as a consequence of the relations our solid space may have with space of higher dimensions; and, instead of drawing, as Professor Clifford does at the close of his article, any conclusion as to the finiteness of all space, if our space could be proved to be of finite positive curvature, I should feel more inclined to infer the existence of space of four dimensions.

Some other remarks of Professor Clifford in this article, as well as what he says about superposition, seem to show that he thinks the different geometries belonging to different kinds of surfaces are intrinsic properties of the surfaces, and independent of the relations the surfaces have to solid space. Thus, speaking of a surface whose parts are different from one another, and cannot be made to fit each other, he says that this "is a property of the surface itself, a part of its internal economy, absolutely independent of any relations it may have with space outside of it." And again, after referring to the relation that connects together the areas and angles of geodesic triangles, he says of a geodesic line, that "it is a line determined by the intrinsic properties of the surface, and not by its relation with external space." But if the difference between these geometries depends upon the different laws that govern the curvatures of the normal sections, then this difference must depend upon the relations of the surfaces to solid space—namely, upon the laws that govern the directions the surfaces take in space, upon the kind of curvedness or curvature of the surfaces. The curvature, indeed, of any continuous point-aggregate at any point depends upon its rate of change of direction about that point, and the term "direction" is a relative one, implying the existence of another continuous point-aggregate of higher dimensions than and containing the first.

We cannot form a mental representation of the curvature of a surface without conceiving it placed in solid space, just as we must conceive the surface in which a curved line lies, if we wish to form a mental picture of its curvature; nor can we image to ourselves curved solid space, if there be such a thing, because to do so, it would be necessary to have a conception of space of four dimensions, a kind of space of which we have no experience whatever. The fact that a flexible and inextensible surface may be bent into other shapes and retain its geometry unaltered, instead of proving that the geometry is an intrinsic property of the surface independent of its relations to solid space, is itself a consequence of that relationship not being one of perfect constraint. In mathematical language, the variable quantities are more numerous than the equations that express the relations between them. Is Professor Clifford prepared to maintain that the difference between the geometries of an anticlastic and synclastic surface does not depend upon the fact that in the former case the surface bends away from the tangent plane at every point partly towards one side of it and partly towards the other, while in the latter case the surface on every side of the point bends away from the same side of its tangent plane? These are relations to solid space which the surfaces never lose however they be deformed. But the most striking illustration of the dependence of the geometry of a surface on its relations to solid space is given by the plane. Of all geometries, plane geometry would *a priori* seem most likely to be independent of relations to solid space. Yet it is only when we regard the plane in relation to solid space that we discover the close connexion between the apparently independent axioms of plane geometry and perceive that this geometry is not peculiar to the plane, but belongs to the whole class of surfaces called developable. The axioms, and the geometry based upon them, are possessed by these surfaces in common with the plane, in consequence of their having the same curvature. This curvature is uniform at every point, and consequently the surfaces and plane possess the property of superposition; they are not anticlastic; if, therefore, two geodesic lines drawn upon them are parallel to a third, they are parallel to each other; at every point one at least of the principal normal sections is a straight line—preserves a uniform direction in solid space—the curvature is therefore zero, instead of some positive magnitude, and there is only one shortest geodesic line between any two points. These properties are the necessary and sufficient basis for the geometry of the plane and its allied surfaces. Professor Clifford, in the course of his argument, refers to the fact that the systems of geometry belonging to different surfaces "could be ascertained by people who lived entirely in them, and were absolutely ignorant of a third dimension." This is very possible. But then their knowledge would be based on a set of independent axiomatic facts. Incapable of conceiving space of three dimensions, they would be as ignorant of the dependence of their axioms on a higher fact—the relation of the surface to solid space—as Kepler and his followers were of the dependence of his well-known laws of planetary motion on the higher fact of gravity acting as a central force, afterwards revealed by Newton.

E. HAWKESLEY RHODES.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, April 3, 3 p.m.	Crystal Palace Concert.	
MONDAY, April 5, 2 p.m.	Royal Institution: General Monthly Meeting.	
5 p.m.	London Institution: Professor Bentley on "The Classification of Plants." I.	
"	Musical Association: Dr. J. Stainer on "The Principles of Musical Notation."	
7 p.m.	Entomological.	
8 p.m.	British Architects. Medical.	
TUESDAY, April 6, 3 p.m.	Royal Institution: Professor Duncan on "The Grandeur Phenomena of Physical Geography."	

TUESDAY, April 6,	7 p.m.	Sculptors of England.
	8 p.m.	Civil Engineers. Pathological.
	8.30 p.m.	Biblical Archaeology: Mr. George Smith on "An ancient Assyrian Sword bearing a Cuneiform Inscription;" the Rev. A. H. Sayce on "An obscure Passage in one of the Assyrian Astrological Tablets;" M. D. Pierides on "A Digraphic Inscription in Greek and Cypriote found at Larnaca;" M. E. Lefebvre on "The Four Races in the Egyptian Representations of the Last Judgment."
WEDNESDAY, April 7,	1 p.m.	Zoological.
	3 p.m.	Horticultural. Dr. Billow's Recital (Chopin), St. James's Hall.
THURSDAY, April 8,	8 p.m.	Microscopical. Society of Arts.
	8 p.m.	Royal Institution: Professor Seeley on "The Fossil Forms of Flying Animals."
	7 p.m.	London Institution: Dr. Freeman on "The History and Use of the English Language." II.
FRIDAY, April 9,	8 p.m.	Mathematical. Inventors' Institute. Historical. Royal. Antiquaries.
	8.30 p.m.	Literary and Artistic.
	7.30 p.m.	Anthropological. Sacred Harmonic Society, Exeter Hall (<i>Israel in Egypt</i>).
	8 p.m.	New Shakspeare Society: Mr. James Spedding on "The Corrected Edition of <i>Richard III.</i> "
		Astronomical. Quekett Club.
	9 p.m.	Royal Institution: Sir William Thomson on "Tides."

SCIENCE.

Cave-Hunting: Researches on the Evidence of Caves respecting the Early Inhabitants of Europe. By W. Boyd Dawkins, M.A., F.R.S., F.G.S., F.S.A., Curator of the Museum and Lecturer on Geology in the Owens College, Manchester. Illustrated by Coloured Plate and Woodcuts. (London: Macmillan & Co., 1874.)

FROM the day when Mr. Boyd Dawkins first delved into the old hyaena-den of Wookey Hole, now fifteen years ago, the general course of his labours, whether with pick or pen, has swerved but little from the path which he then struck out. Engaged at times in the actual exploration of bone-caves, he has more frequently directed his studies to those organic remains which represent the old cave-dwellers and their contemporaries; while upon occasion he has risen to the discussion of some of the higher problems of ethnology and physical geography which are suggested by such researches. As a necessary consequence of all this, it follows that the present work, so far from being a mere gathering of other men's stuff, is to a very large extent a record of original research. Bringing his own results into relation with those of other observers in the same field, Mr. Dawkins has given cohesion to a quantity of scattered materials, and at the same time has moulded the accumulated mass into a very comely form. While, therefore, the present volume will be prized by the student as the only modern work devoted to the subject of cave-exploration, the attractive style in which it is written sufficiently commends it to any intelligent reader who may care to hear the Story of the Caves.

Although caverns and grottoes may be hollowed out in rocks of any mineralogical composition, it is chiefly in limestones that such cavities abound. This is due not so much to the ease with which these rocks yield to mechanical agencies, as to the readiness with which they give way before the solvent action of ordinary waters. Car-

bonate of calcium, it is true, is but very slightly soluble in pure water, but pure water is utterly unknown in the economy of nature. Rain-water in its mere passage through the atmosphere dissolves more or less of the carbonic acid present in the air, while the water which flows over the surface of the ground readily takes up still more of this gas, evolved as it is from all decaying organic matter as one of the final products of its decomposition. Such water, finding its way into the cracks and crannies which abound in every limestone rock, dissolves the carbonate of calcium to a very appreciable extent, thus widening the channels through which it flows, and eating out for itself new passages along any lines of weakness. The limestone, however, is not only eroded by these acid-laden waters, but is further fretted away by the grinding and scouring action of the silt and pebbles carried along by the flowing stream. Thus, partly by chemical and partly by mechanical action, there are gradually formed those irregular cavities which often open into subterranean vaults of considerable extent. But while the action of running water on a limestone rock is thus destructive in one sense, it is constructive in another. The water having once dissolved the carbonate of calcium, and consequently become, as we commonly call it, "hard," may readily yield up the carbonic acid which retains it in solution, and thus precipitate the calcareous matter in a solid form. It is in this way that the walls, the roof, the floor of a limestone-cavern may become decorated with those whimsically-shaped masses of stalactite and stalagmite which give so marked a character to cavern scenery. If the deposits be thrown down on the walls of a fissure or of an expanded cavity, they will tend to choke up the hollow, and thus produce a solid mass of mineral matter; for this kind of action Professor Dawkins suggests the term *incretinary* as opposed to *concretinary*. It is clearly desirable to establish a distinction in describing these two opposite modes of growth; and we would suggest that this may readily be done by borrowing from the botanist the well-known terms "endogenous" and "exogenous." An *endogenous* mineral deposit would therefore be one in which the several layers are thrown down in succession as so many linings on the inner walls of a cavity; the growth thus proceeds towards the interior, or centripetally, and the innermost deposit must needs be the most recent. On the other hand, in an *exogenous* mineral deposit the growth proceeds from within outwards; the direction is centrifugal, and the innermost layers are the oldest. An agate, in which the siliceous crusts have been deposited one after another upon the walls of a cavity, is a mineral *endogen*; its size being limited by that of the original hollow. A boss of stalagmitic limestone, in which the several deposits are wrapped successively around a central nucleus, is a mineral *exogen*; and as layer succeeds layer, the growth in this case may proceed to an indefinite extent.

It was upon a celebrated boss of stalagmite, known from its shape as the "Jockey Cap," in Ingleborough Cave, that Professor Dawkins, a year or two ago, made some in-

teresting observations on the growth of stalagmite, with the view of setting up some rude kind of geological chronometer. A geologist is rarely able to express the age of a given deposit in terms of our ordinary units of time: his idea of time is, indeed, relative rather than absolute; he knows that a certain stratum is older than one and younger than another, but how much older or how much younger he is generally unable to guess. If, however, he knew the rate at which a calcareous deposit was being regularly formed in a given locality, it is obvious that its thickness would give an approximate date to any relics which might happen to lie sealed up beneath the stalagmitic crust. Professor Dawkins's observations go to show that the rate of formation may be comparatively rapid, at least in this locality, and that the Jockey Cap, after all, may not date back beyond a century. "It may be fairly concluded," he remarks, "that the thickness of layers of stalagmite cannot be used as an argument in support of the remote age of the strata below." But if no argument can be founded on these calcareous deposits, the cave-hunter fortunately has at hand a dozen other kinds of evidence capable of proving beyond question the vast antiquity of some of the deposits in our bone-bearing caves. Yet it is a curious fact, that, with a single exception, none of the caverns hitherto explored have yielded remains older than the Pleistocene period.

"Pleistocene" is a term that was originally suggested by Sir Charles Lyell, on palaeontological grounds, to designate those beds which are more modern than the uppermost Tertiary strata, but older than the deposits accumulated within the "Recent" period. In this Pleistocene, or, as it is otherwise called, Post-pleiocene or Quaternary age, the physical configuration of Europe differed considerably from its present form; at one time much of the land must have stood high above its present level, so that what is now Ireland was joined to Britain, and Britain to the mainland of Europe, while the Continent in turn communicated with Africa by way of Spain and Italy. Important differences, too, are traceable in the fauna, especially in the mammalia, the Pleistocene mammals including a number of species now known only by their fossil remains. Our knowledge of the Pleistocene mammalia—a subject on which few men are entitled to speak with a higher authority than Professor Dawkins—has been largely derived from studying the remains which have been brought to light from time to time, during the investigation of the bone-bearing deposits in caves.

As far back as the sixteenth century some of the German caves were ransacked in quest of "unicorn's horn," which under the name of *ebur fossile* held a high place in the materia medica of those days. Yet it was not until the latter part of the last century that any of these caverns were scientifically explored. In 1816 Dr. Buckland visited the celebrated cave of Gailenreuth, in Franconia—a cave which had yielded a great number of mammalian remains—and, profiting by the experience of this visit, he was enabled a few years afterwards to apply his knowledge with good effect to the exploration

of a newly-discovered cave at Kirkdale, in the Vale of Pickering, in Yorkshire. His researches proved that the organic remains found in this cave were those of animals which had once roamed through the Yorkshire valleys; that the cave had, in fact, been inhabited by hyaenas, and that these creatures had dragged in the carcasses of the animals upon which they preyed, such as the mammoth, the rhinoceros and the bison. The Kirkdale researches were followed up by the exploration of other caves, and the year 1823 witnessed the publication of the famous *Reliquiæ Diluvianæ*. Although many of the phenomena observed by Dr. Buckland were interpreted with singular sagacity, it is to be regretted that on other points his judgment was warped by the prejudices of his day, and the bias of his opinions tended for a long time to check freedom of thought on many of the subjects connected with cavern researches. Even when it was announced more than twenty years afterwards, by highly competent observers, that some of the deposits bore evidence of the co-existence of man with the old cave-mammals, the announcement met the usual fate of every new truth which threatens to disturb established opinion, and was received even by geologists with an incredulity which seems difficult to account for when looked back upon by the lights which we now enjoy. Gradually, however, the force of prejudice gave way before the cumulative evidence, and the truth at length asserted itself that the antiquity of man must be carried back to the period of the extinct Pleistocene mammals—a conclusion abundantly confirmed by researches in the Brixham Cave, the Wookey Hole hyaena-den, Kent's Cavern, and elsewhere; not to mention the evidence of the implements and bones from the old river-drifts.

The earliest relics of Pleistocene man consist of rudely-chipped unpolished flint implements, representing that primitive phase of human existence known as the Older Stone Age, or the Palæolithic period. The cave-men of Pleistocene times who used these palæolithic implements in hunting and fishing, are supposed by Professor Dawkins, and some other ethnologists, to have left their representatives in the Eskimos—a people who use at the present day a set of implements similar in type to those found in some of the old French caves, and who live in association with a fauna containing some of the same animals, such as the reindeer and the musk-sheep. Indeed, it appears that towards the close of the Pleistocene period palæolithic man retreated northwards, in company with some of the Arctic mammalia. But, while these northern forms indicate a severe climate in these latitudes, another factor entered into the composition of the old fauna, in the shape of a southern group of animals which point to a milder temperature. In fact, the Pleistocene fauna was made up of a curious intermixture of northern and southern types, and Professor Dawkins believes that this association may be best accounted for on the supposition of seasonal migrations; that is to say, the southern forms migrated northwards in the summer, and the northern forms wandered southwards in the winter, so that the same area thus

became the common feeding-ground, although at different seasons, of boreal and austral species, just as is known to be the case to some extent at the present day in parts of Siberia and North America. From Professor Dawkins's profound study of the Pleistocene mammalia he has been led to suggest a classification of the Quaternary deposits into three groups, each characterised by a distinctive fauna. The relics in most of the bone-caves of England, France, and Germany, and in the river-drifts of North-Western Europe, may be assigned to the latest of these three stages.

Advancing from the late Pleistocene or Palæolithic period to the succeeding Neolithic age, the evidence of the caves shows that they were then extensively used by man, in some cases for shelter and habitation, in others for sepulture. In all likelihood the neolithic cave-men were not the descendants of the preceding palæolithic folk, but were a distinct race, who invaded Europe from the East, bringing with them domestic animals, such as the dog, the goat, the sheep, and the long-faced ox (*Bos longifrons*). To judge from their remains, they must have been men of small stature, with long heads; and it is curious to note—though it is pretty well established that this characteristic has no great ethnological significance—that in many cases the tibiae or shin-bones present a peculiar flattening known as *platynemism*. On the whole the Neolithic men seem to have been a non-Aryan race of Iberian stock. It appears, however, that these people were not allowed to enjoy undivided possession of North-Western Europe in Neolithic times; since the broad skulls occasionally found in caves and tumuli of this period point to a different race—it may be an Aryan people allied to the Celts—who pressed upon the earlier inhabitants, and shared with them the occupancy of Gaul and Britain in this and the succeeding ages.

There are but few cave-remains that can be safely referred to those epochs of civilisation which followed the stone-using periods, and are generally known as the ages of Bronze and Iron. Indeed, man had then arrived at too high a state of culture to be content with the half-savage life of a troglodyte. Professor Dawkins groups together the Neolithic, Bronze and Iron ages under the general term of "pre-historic" time; whilst, unlike most writers, he excludes from this term the Palæolithic age.

Crossing the threshold of history, we find ourselves in possession of facts pointing to the occasional occupation of caves, even down to comparatively recent times. One of the most interesting examples is furnished by the Victoria Cave, near Settle, in Yorkshire; a cave which has been carefully explored by a committee of the British Association, under Professor Dawkins and Mr. Tiddeman, and which is notable for exhibiting clear proof of successive occupations at widely-separated intervals. A deposit of clay, believed by some authorities to be of pre-glacial age, has yielded a bone which Professor Busk has identified as a human fibula, and it is thus one of the earliest relics of man which cave-exploration has yet brought to light. The Pleistocene cave-

earth contains abundant remains of the cave-hyaena and other Quaternary mammals, while the presence of man in Neolithic times is sufficiently proved by the occurrence of characteristic objects in stone and bone, associated with a Neolithic fauna. But the more recent tenants of this cave have left behind them the clearest traces of their tenancy in the shape of bronze fibulae and other personal ornaments, beautifully wrought, and enriched with enamelling. These enamelled bronzes, associated with objects in bone, jet, and glass, together with Roman coins, form a group of relics fixing the date of their owners somewhere between the first half of the fifth and the early part of the seventh century. Taking all the characteristics of these memorials into consideration, the conclusion is forced upon us that some Romano-Celtic or Brit-Welsh families, not unaccustomed to the luxuries of life, must have fled for refuge to this cave on the wild scars of Craven at some time during that unsettled period which intervened between the departure of the Roman legions and the English invasion of Strathclyde.

Although we have been led in this notice to pass from the oldest to the most recent caves, it should be remarked that Professor Dawkins commences with the historic caves, and works backwards to those of prehistoric and Pleistocene age. In an appendix he offers some practical suggestions as to the best method of cave exploration; suggestions which are of much value, since they are the fruit of his own experience as a cave-hunter. This appendix also contains a description of the method of systematic cave-working, as conducted at Kent's Hole by Mr. Pengelly, who is a very Nimrod at this kind of sport. May these practical hints be turned to good account by those who, having read Professor Dawkins's volume, shall feel themselves bestirred to take part, honestly and patiently, in the good work of cave-exploration!

F. W. RUDLER.

Der Paulinismus. Ein Beitrag zur Geschichte der urchristlichen Theologie. Von Otto Pfleiderer. (Leipzig: 1873.)

THE second part of this work, of which a notice was promised in the ACADEMY for July 25, 1874 (p. 103), begins with a description of the original relation of Pauline to Jewish Christianity, in which three phases are to be distinguished:—1. The contest regarding the continued validity of the Law (Galatians); 2. That regarding Paul's apostolic authority (1 and 2 Corinthians); and 3. An irenic tendency which Pfleiderer finds in the epistle to the Romans, and also in that to the Philippians. It is in the epistle to the Hebrews, he holds, that Paulinism first comes under the influence of the Alexandrian philosophy, and this epistle, with that to the Colossians, and the epistle of Barnabas, accordingly form the subject of his next chapter. Here we have a more advanced Christology than that of Paul; the object of the two former epistles at least being to establish the headship of Christ and the sufficiency of his salvation, in opposition to the adherents of a speculative and ascetic Judaism, while Paul's doctrine of atonement

has been so far weakened that "justification through the blood of Christ" is now replaced by the "forgiveness of sins" (in Colossians and Barnabas), not, however, so much in the sense of a Divine act as of a human condition. Pfeiderer, it may be noticed, follows Holtzmann in assuming a genuine Pauline fragment as the basis of our present epistle to the Colossians; but does not agree with him that the interpolator is identical with the author of the epistle to the Ephesians, which, on the contrary, he classes with Clement's first epistle to the Corinthians, and 1st Peter, as marking the transition from Paulinism to Catholicism. Here the sharp opposition between Pauline and Jewish Christianity, which had reached the extremest point in the epistle of Barnabas, has finally disappeared, and Paulinism, which, in union with Alexandrianism, had already lost much of its original character, is still further changed. Christianity, under pressure of the demand for an ethical code, has come to be regarded chiefly as the new law. The ground of salvation is no longer the sacrifice on the cross, but repentance. The conception of Faith, as well as its object, is entirely changed, and looking chiefly to a future glory—the appearance of Christ as Judge of the world—rather than to an event completed in the past, it has come to be essentially the same with Hope. Pfeiderer will not see any trace of the Pauline doctrine of the atoning efficacy of Christ's blood in the references, certainly of a general kind, of Clement's epistle (V. cap. xii. and xxi.), nor even in such passages as 1 Peter i. 18, 19, ii. 24, or iii. 18. How language could be much stronger than in these last it is not easy to see; and if the writer was, as Pfeiderer with much reason supposes, a Hellenistic Jew, dependent on Paul, it is probable that he would retain the leading thought as well as the phraseology of the apostle of the Gentiles. It is true, however, that we have nothing here of the "wrath of God," or the "curse of the law," and so far, therefore, there is undoubtedly a modification of the original Pauline doctrine. The epistle of Clement has been claimed both as a Pauline and a Jewish Christian work, and this circumstance is not unreasonably urged as an indication that in fact it was neither. Jewish Christian it certainly is not; and had it been Pauline, argues Pfeiderer, and written with the view of conciliating adversaries, the expressions characteristic of Paul and the praise of that apostle would have been omitted, and his ideas retained, whereas the contrary is the case. "What would have been" on certain assumptions, it must be owned, is always rather precarious ground to take, though it cannot always be avoided by the critic. There can, however, I apprehend, be little difficulty in accepting Pfeiderer's general conclusion regarding both those epistles, that they were simply what they claim to be—paraenetic compositions, called forth by the exigencies of the time, and only incidentally betraying their doctrinal or party tendencies. The writers, he holds, were in their own view Pauline Christians, but had insensibly departed from the Pauline stand-point. The pastoral epistles, of which, on strong internal grounds,

the true order is assumed to be—2 Tim., Tit., 1 Tim., and the Ignatian epistles form the subject of another chapter, exhibiting ecclesiastical Paulinism in conflict with the heretical Gnosis; and the work concludes with a short but important section on the Acts of the Apostles, in which the main results of the Tübingen criticism are sought to be reconciled with a view more favourable to the *bonâ fide* character of the history.

On this last topic a word may be added. The writer's point of view, it is admitted, was that of Catholic Christianity, from which he assumed the essential agreement of the Jewish-Christian and heathen-Christian parties in the primitive Church. This assumption naturally regulated the choice and arrangement of his materials; but it does not follow that it induced him to create materials which never existed, or intentionally to pervert those he had. The speeches, indeed, Pfeiderer contends, were the free composition of the author, as much as those of Thucydides or Livy, but he sees no difficulty in the inconsistencies chargeable on Paul, on the supposition that the narrative in Acts is substantially correct, the degree in which matters of form should be made matters of principle admitting of such a variety of equally honest opinions. No doubt, when Paul declared that he was made "all things to all men," he had in mind other passages in his life than his stern resistance to the false brethren in the case of Titus. Some such middle view as this, it has long seemed to me, is more satisfactory than either that which accepts the narrative as a perfectly correct and unbiassed representation of the facts, or the other, equally extreme in the opposite direction, which rejects the whole as purely fictitious.

ROBERT B. DRUMMOND.

SCIENCE NOTES.

METEOROLOGY.

Weather Telegraphy in France. M. Le Verrier has recommenced since March 1 the issue of his announcements of probable weather for the ports of France. These had been a prominent feature of the French arrangements in former years, but had been suspended by M. Le Verrier when he resumed office at the Observatory about two years ago.

The present system does not include the use of any signals to give warning of storms, but simply consists in the transmission of telegrams, containing the forecasts, twice daily. These telegrams are posted up in some public place, and in addition to them the weather chart contained in the *Bulletin International* is exhibited as soon as it arrives by post.

Theory of Cyclones.—In the *Annuaire du Bureau des Longitudes* for this year, M. Faye, whose papers on solar physics have long been before the public, has taken up the vexed question of the origin and form of storms. His attention has been apparently drawn to the discrepancy between the views of M. Bridet and Mr. Meldrum as to the form of the Mauritius hurricanes; the former upholding the truth of the old circular theory, while the latter asserts that many ships have been lost by adhering too closely to it, and that in certain parts of a cyclone the wind blows directly towards the centre, instead of taking a circular course round it. Strictly speaking, however, M. Faye's work must be taken as a counterblast to Professor Rye's *Wirbelstürme*, which book, however, he does not once mention. Both

authors treat of the cyclones in the sun's envelope, and compare them with those observed on the earth; both seek for the proofs of their theories in the movements of waterspouts, and apply their conclusions to the behaviour of storms of the largest dimensions; but they explain the phenomena on principles diametrically opposed to each other.

Rye assumes an upward motion as the first cause of a whirlwind, approving of Belt's explanation of the production of a whirl when a mass of heated air forces its way upwards through cooler strata above it. Faye, however, considers that all such phenomena are descending currents of air of a conical shape, like the whirlpools and eddies which form in water. He considers the motion of translation of the storms to be due to the fact of its upper portion being dragged along by the upper current in which it takes its rise.

M. Faye is, however, not the first who has suggested that the upper currents give rise to cyclones, for Dove's explanation of the origin of the West India hurricanes is that they are generated by the interference of a portion of the upper Antitrade with the true Trade-wind.

With reference to the velocity of the air in storms and its relation to the differences of pressure, we shall hope shortly to give our readers a notice of a careful digest of the theories recently propounded by Colding and Ferral, which has been prepared by Dr. Hann, and of which the first portion has appeared in the last number of the *Austrian Journal for Meteorology*.

Upper Currents of the Air.—Professor Hildebrandsson has published, in the *Transactions of the Royal Society of Upsala*, a paper on the upper currents of the atmosphere. He has investigated the motion of the cirrus cloud by means of observations made at twenty Swedish and four Danish stations, as well as by M. Renou at Paris. The results are plotted down on charts of the weather of the North of Europe for thirty-two days. The general outcome is that the air flows away from the centres of minima, and flows towards the centres of maxima in the upper regions of the atmosphere. This is exactly the opposite to what occurs at the earth's surface, and, as will be seen, is in distinct contradiction to the views of M. Faye, while it accords with those of Buchan and Ley.

The Conference for Maritime Meteorology.—The report of this meeting, which was held here last September, has just appeared. The actual resolutions passed were published in the *Times* in October last, but the full report contains some matter of considerable interest in the statements received from the several countries which took part in the Brussels Conference in 1852, as to the steps which had been taken in each country to carry out the proposals of that meeting.

The result may be fairly described as poor enough, for with the exception of the United States, Holland and this country, not one of the nations attending that conference has ever published any charts or papers as the outcome of the arrangements then made.

The general tenour of the report is to the effect that the twenty-five gentlemen present, representing every maritime country of importance in Europe, expressed their opinion that the decisions taken at Brussels were on the whole good, and that no material alteration of them was advisable. It remains however to be proved whether or not we are to expect more copious results for foreign nations from the private conference of 1874, than from the official one of 1853, which latter, however, was of paramount importance to this country, as it led to the foundation of Admiral FitzRoy's Meteorological Department. The United States took no part in the late meeting, as it was explained that their Hydrographical Office wished to confine its operations to the completion and revision of Maury's charts. The report contains the instructions proposed to be issued to the maritime observers of the Meteorological Office.

Climate of Senegal.—At the time of the Ashantee war we were abruptly brought to acknowledge our nearly total ignorance of the climate of our possessions on the west coast of Africa, Dr. Horton's work, though a good one, being not sufficiently detailed to give the information required. There is, therefore, much reason to welcome a new book by Dr. Borijs, *Recherches sur le Climat de Sénégal*, based on the experience of his own five years' residence, and of a mass of observations accumulated during twenty years by various observers. The data are almost entirely furnished from the registers kept at Goree and St. Louis. In one particular the present work excels most other books on tropical meteorology, viz., that it gives minute particulars as to the exposure of the thermometers, &c., a matter of even more importance in hot climates than here. Dr. Borijs takes pains to prove that the climate of the colony does not exhibit so excessive variations of temperature as had previously been alleged. In his observations at St. Louis he employed the *thermomètre fronde* for the determination of the temperature, alongside of the fixed thermometers, and he gives some interesting statements as to the relative value of the two methods of observation.

Proportion of Oxygen in the Air.—In the third and fifth numbers of the Austrian *Journal for Meteorology* for this year, Dr. Ucke, of Samara, has discussed this question in relation to the sanitary efficiency of various climates. Samara is in 34° N. lat. on the Tigris, and although it is on the open steppe, and exposed to great vicissitudes of temperature, it is a place much frequented by invalids, and consumption is hardly known there. Dr. Ucke thinks this may be due to the greater amount of oxygen inhaled in a given time at Samara as compared with that available at other stations. He finds great difficulty in obtaining materials for comparing this climate with that of other health resorts, owing to the deficiency of published observations for such places, but finally he takes seventeen stations, situated for the most part in Europe and Asiatic Russia. The amount, in pounds, of oxygen passing through the lungs in a week, varies from 200 lb. at Barnaul, to 167 lb. at Seringapatam. London does not come very badly off, giving us 192 lb., while the central European stations and those at a high level give lower figures.

Excluding the three Indian stations, Sitka, and the mountain station Peissenberg, in Bavaria, the remaining twelve places are divided into four groups which give the following results as to the yearly amount of oxygen in pounds:—Siberia, 2,385; Eastern Europe, 2,326; Western Europe (Brussels and London), 2,305; Central Europe, 2,272. Practically, therefore, rather more than a ton of oxygen is inhaled by everyone in a year. The amount of oxygen is increased by high barometrical pressure, and reduced by high temperature and humidity. When we compare the results for the several months with the average of the year, we find that London shows a slight excess in the summer, evidently owing to its moderate temperature; while the Siberian stations exhibit a strong positive variation in the winter in consequence of their low temperature and high pressure.

GEOLOGY.

At the last meeting of the Geological Society it was announced that Sir Charles Lyell had bequeathed the sum of 2,000*l.* to be invested by the society, the proceeds of which are to be applied to the encouragement of geological research, and to be accompanied by a bronze medal struck in memory of the founder. Sir Charles has expressly provided that the award is to be made without respect either to nationality or to sex. The bequest was duly acknowledged in appropriate speeches by Professor Prestwich and Mr. Warrington Smyth. The Geological Society has now in its gift three medals and the proceeds of three donation funds, bearing the names of Wolaston, Murchison, and Lyell.

UNDER the title of *The Past and Future of Geology*, Professor Prestwich has published the inaugural lecture which he recently delivered at Oxford. After a brief tribute to the memory of his predecessor, Professor Phillips, he discusses the nebular hypothesis, and speculates on the origin and early history of our globe. He then points to the vast progress made in palaeontology since the year 1822, when Phillips and Conybeare published their *Geology of England and Wales*. At that date the organic remains in Great Britain, which had been described, numbered only 752 species, while at the present time we are acquainted with no fewer than 13,276 species of British fossils. Taking a census of past life, he appends a table by Mr. Etheridge showing the number and distribution of the fossil fauna and flora in 1874. Quitting palaeontology, Professor Prestwich addresses himself to the discussion of some of the great principles of physical geology, and exhibits a decided leaning towards the so-called cataclysmic theory. As he believes that the elevatory forces, acting on the crust of the earth, were formerly much more powerful, he enquires how the crust has come to attain its present comparatively stable and quiescent condition. Rejecting the hypotheses of Mr. Hopkins and Sir W. Thomson, the author suggests that a sufficient cause may be found in the intense refrigeration of the earth's crust during the glacial period; and on this supposition he is led to a curious argument with reference to the preparation of the earth for the advent of man.

Of late years the officers of the Geological Survey have been instructed to observe the characters of the surface-soil in order that special maps showing the superficial geology may be published. As the drift-survey of the Lower Thames valley and of South Lancashire has been completed, Mr. de Rance was enabled to read, at a recent meeting of the Geologists' Association, a paper "On the Post-Glacial Deposits of some Valleys of the North and South of England, and their relation to the Antiquity of Man." The gorge of the Ribble, near Preston, is entirely excavated in glacial drift, and is therefore of post-glacial age. Old terrace-gravels, with flint implements, occur in the valley of the Ouse, at Bedford, which has been cut through boulder-clay, and is consequently, like the Lancashire valleys, post-glacial. These terrace-gravels were compared with the implement-bearing gravels of the Thames, the Seine, and the Somme, which the author concluded were deposited either since the glacial epoch, or at a very late episode in that period.

For the last two years Mr. W. M. Gabb has been engaged in the exploration of the district of Talamanca, in the south-eastern corner of the Republic of Costa Rica, which forms one of the least known parts of Central or Isthmian America. The high mountains of Talamanca are composed principally of granitic rocks, which appear to be strictly intrusive, and not of metamorphic origin. The granite range culminates in Pico Blanco, which has been described as a volcano, although no sign of a crater could be discovered by the exploring party. The sedimentary rocks appear to be of Miocene age; indeed, Mr. Gabb concludes that the whole Atlantic slope of Costa Rica may be safely regarded as Miocene. Some of the shales are associated with beds of inferior coal, while the metamorphosed miocene rocks occasionally contain gold; but although traditions of valuable gold-mines have long existed, and indeed led to the present exploration, it appears that the occurrence of the precious metal is of scientific rather than commercial interest. Mr. Gabb's paper will be found in the March number of the *American Journal of Science and Arts*.

To the March number of *Silliman's Journal* Professor O. C. Marsh contributes descriptions of some new forms of Eocene and Miocene quadrupeds. Under the name of *Lemuravus* he describes a new genus allied to *Hyopsodus*, Leidy, and suggests that both may represent a distinct family

called *Lemuravidae*. The present species, *L. distans*, was about the size of a large squirrel, and has left its remains in the lower Eocene of Wyoming. During a recent expedition to the "Bad Lands," in Nebraska, the lower jaw of a monkey was found in Miocene rocks; its molars resemble those of certain South American monkeys, and come still closer to those of the Eocene *Limnotheridae*. The present species is regarded as the representative of a new genus, and has received the name of *Laopithecus robustus*. Professor Marsh also describes some horned rhinoceroses, which are the first that have been found in America. He forms for them a new genus, *Diceratherium*. One species, *D. armatum*, about two-thirds the size of the Indian rhinoceros, was found in the Miocene of Eastern Oregon. Other species are described under the names of *D. nanum* and *D. advenum*.

A PAPER on the fossil Lemmings and Arvicolae from the pleistocene beds of Theide, near Wolfenbüttel, in Prussia, has been contributed by Dr. Nehring to a recent number of the *Zeitschrift für die gesammten Naturwissenschaften*. Since the days of Leibnitz, the gypsum quarry near Theide has been known as a rich locality for mammalian remains. The pleistocene loam overlying the gypsum is in places twenty to thirty feet in thickness, and is apparently a fresh-water deposit. In addition to the larger mammals it is rich in the remains of small rodents; but these have hitherto received but little attention. Dr. Nehring has, however, found and described a large number of bones and teeth, including two perfect skulls, with the lower jaws. These remains are referred to *Myodius lemmus*, *M. torquatus*, and *Arvicola gregalis*. The author enters into a critical examination of the dentition of the various species of lemmings and voles.

With the exception of the extinct order *Labyrinthodonta*, none of the true Amphibians are known to occur in rocks older than the tertiary formations. It is, therefore, interesting to note that M. A. Gaudry has recently laid before the French Academy of Sciences a note, "Sur la découverte de Batraciens proprement dits dans le terrain primaire." The specimens described in this communication were obtained from bituminous schists of Permian age at Igornay and Millery, in the Department of the Saône-et-Loire, where they are associated with numerous remains of plants and with fish of the genus *Palaeoniscus*. The new amphibians, which are extremely small, closely resemble the existing land-salamanders, and have received the name of *Salamandrella petrolei*.

FROM the outcrop of some limestone-rocks in the neighbourhood of Pernambuco, in Brazil, a large collection of fossils was made by Messrs. Derby and Wilmot, during the Morgan Expedition of 1870, under Professor Hartt. The mollusca have been placed in the hands of Mr. R. Rathbun, of the Museum of the Boston Society of Natural History, who has published in the Society's Proceedings a report on the more important lamellibranchs. With two exceptions they are all referred to new species.

EVERY petrologist knows the great difficulty of distinguishing between the four triclinic feldspars—albite, oligoclase, labradorite, and anorthite. Whilst they are sharply separated as a group from the orthoclastic or monoclinic feldspars, they are so closely related *inter se* that they are generally associated under the common name of plagioclase; the petrologist, and even the mineralogist, finding it by no means easy to diagnose the several species when they occur as rock-constituents. M. des Cloizeaux has therefore rendered good service by closely studying the optical characters of these feldspars, with the view of establishing some method of differentiating them. He has succeeded beyond expectation, but the means of diagnosis are so technical that the student must be referred to the original paper

recently published in the *Comptes Rendus*. Suffice it to say that these studies lend no support to Tschermak's theory, which regards all the triclinic feldspars as isomorphous mixtures of albite and anorthite. Moreover, by studying the position of the optic axes, and the character of the dispersion, M. des Cloizeaux shows that the "moonstone" of Mineral Hill, Delaware county, Pennsylvania, is an albite and not an oligoclase; and that Von Kobell's so-called new species Tschermakite is also an albite feldspar.

THE *Zeitschrift für die Oesterreichischen Gymnasien* for January and February contains an article by O. Benndorf on various unexplained points connected with the arrangements of the Attic theatre, notably the manner in which the great public was admitted and distributed. The conclusion of the writer's long and ingenious argument is, that they were divided according to tribes (φύλαι), as in the Ecclesia. The second part of the January number is taken up with reviews of no great importance; the third part contains a very interesting account by Tomaschek of the chief results arrived at by the Commission appointed to discuss educational questions at Berlin in 1873. Among other points we may notice that there seems to have been a tendency to disparage the continuance of Latin as a subject proper for the Realschulen, and that the system of bifurcation was not, on the whole, regarded with favour. It was nearly unanimously agreed that Natural Science ought to be taught in the Gymnasias to all classes for two hours a week. Other questions of detail discussed at the conference are mentioned in this article, which deserves to be read by friends of education. Besides the article by Benndorf mentioned above, the February number has reviews of Cron's studies on Euripides, Curtius's Greek Verb, Wilmanns' Latin Inscriptions, and Quicherat's Nonius, all more or less favourable. Wülcker's *Altenglisches Lesebuch* is criticised less favourably by J. Zupitza. K. Werner, in the third part, discusses the educational statute of Bavaria, complaining, among other things, that no place is given to Natural History in the list of subjects enumerated as necessary for a liberal education, and that Physics are but barely provided for in the programme of the Bavarian gymnasias.

THE most immediately interesting article in the last number of the *Hermes* (vol. ix. part 3) is by C. Henning, who publishes for the first time a letter of the Emperor Julian from the Harleian MS. No. 5610. The letter refers to a certain Pegasus, a pretended convert to Christianity, who acted as the guide of Julian when on a visit to Ilium, and is lauded by the Emperor for his care of the religious monuments of the city, in which he was acting as Christian bishop. Several interesting points started by the letter are ably discussed by the writer of the article. Theodor Mommsen contributes two articles, one on the list of magistrates in the Capitol, the other on the decree of the Senate quoted in Josephus *Ant.* xiv. 8. 5. The points raised in the first are too minute for mention here, but are handled with Mommsen's usual mastery of his materials; the second article is an interesting argument to show that the date given by Josephus (B.C. 47) is the right one, and that Scaliger was wrong in assigning the decree to the year 124; Ewald, Ludwig Grimm, Ritschl, and Mendelssohn wrong in assigning it to the year 139. Wilamowitz-Möllendorff has a spirited and ingenious paper on the Megarian comedy, the point of which is that the Megarian origin of the Attic comedy is a delusion, and that a "Megarian joke" meant nothing more than a bad or coarse joke, just as the *Atellana* was localised as Oscan by the Romans. H. Jordan discusses a number of difficulties arising on the question of the temple erected to Julius Caesar. The critical matter contributed to this number comprises articles by Patsch on the Johannis of Corippus, Hertlein on some Greek prose authors

(Xenophon, Diodorus, Philostratus, Julian), Treu on the Parrhasian codex of Quintus Smyrnaeus, Förster on Libanius. Bardt replies to Lange on the *Lex Caecilia Didia*.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY (Monday, March 15).

SIR SIDNEY SMITH SAUNDERS, President, in the Chair. Mr. Sealy exhibited specimens of an *Ornithoptera* bred from larvae taken in Malabar on *Aristolochia indica*.

Professor Westwood exhibited drawings of several undescribed Coleoptera of remarkable forms, of which he intended to communicate the descriptions. Among them was an insect from the collection of M. Mnizech, which bore a strong resemblance to a *Rhysodes*, and which he had named *Rhysodina Mnizechii*, but was really a Heteromorous insect.

Mr. McLachlan remarked that the species of *Lepisma*, exhibited at the last meeting by Mr. F. H. Ward, did not correspond with the description of *L. domestica* of the United States, nor with the description of any species with which he was acquainted.

Mr. Butler communicated some critical remarks on the recently published work on the *Sphingidae*, by Dr. Boisduval.

The Rev. R. P. Murray read some remarks on the species of *Terias*, forming the Hecabe group, which tended to show that the insects which had hitherto been considered distinct species under the names of *Aesiope*, Mén., *Brenda*, Doubl. and Hew. and *Sari*, Horsf., were mostly, if not all, referable to but one species, *T. Hecabe*, Linn. Professor Westwood suggested that the case might be analogous to certain English species of *Pieris*, where certain forms—e.g., *P. napaea*, Esp., and *P. sabelliae*, Steph., now universally recognised as varieties of *P. napi*, Linn., had long been considered as specifically distinct. Professor Westwood also suggested that attention should be paid to the times of appearance of the various forms, and the period noted during which they remained in the pupa stage. Mr. Butler remarked that the latter circumstance had an important bearing in the case of *Papilio Ajax*, Linn.

Mr. J. S. Baly communicated "Descriptions of new Genera and Species of Phytophagous Coleoptera."

Mr. C. O. Waterhouse communicated a paper on the Lamellicorn Coleoptera of Japan.

Mr. F. Smith read "Descriptions of new Species of Indian Aculeate Hymenoptera collected by Mr. G. R. James Rothney," and also "Descriptions of new Species of Bees of the genus *Nomia*, Latreille."

Part V. of the Transactions for 1874, containing the title-page and index, with five plates, was on the table.

ROYAL GEOGRAPHICAL SOCIETY (Monday, March 22).

At the usual fortnightly meeting of the Society, Mr. Coryton, late Recorder at Moulmein, read an interesting paper on the routes from Burmah into South-western China. During his residence in British Burmah, Mr. Coryton devoted much pains to the collection of all available information at the hands of Shan traders respecting the routes and nature of the country traversed by them, the people and tribes through whose territories they passed, and other particulars. Although Mr. Coryton in his paper did not, strictly speaking, convey any new information, he presented with much clearness a summary of the different attempts which had been made to explore particular routes as well as of the various projects for "tapping" the wealth of Yunnan, and diverting it in the direction of the ports of British India. Mr. T. T. Cooper's two attempts, made from the side of China and from that of Assam respectively, Major Sladen's ascent of the Irrawaddy to Bamo

and Momein, the expeditions of Williams, Macleod, and Richardson, and of the French up the Mekong and Songkoi, all were carefully reviewed, while Captain Sprye's scheme for communication between Rangoon and Esmok was also touched upon. The lecturer appeared to favour the route *via* the Irrawaddy to Bamo and Talifu, both on account of its antiquity and the exceptional advantages which in the navigability of the Irrawaddy we possess over all the other rival streams. Mr. Coryton then referred to the recent disaster which had befallen Colonel Browne's expedition, and after speaking in terms of praise of the late Mr. Margary's perseverance and promise, concluded in the words used by the Secretary to the Society in a recent letter on the subject, "Young Margary is dead, but he has left us a noble legacy in his example."

Mr. T. T. Cooper said he did not pretend to be an advocate of one particular route, but simply a pioneer. He expressed an opinion that the Shans were more civilized than Mr. Coryton gave them credit for being.

Sir George Campbell was of opinion that now that affairs were quieter than formerly, a considerable trade might spring up between British Burmah and China, while from the side of Assam much might be done in the way of encouragement of trade by the fostering and developing of frontier fairs.

Sir Rutherford Alcock laid stress on the necessity of a great Asiatic power like England showing firmness and dignity after an outrage such as had been passed upon her. Prompt action was of vital importance so as to secure us due respect from our neighbours and subjects. The jealous frontier policy of the Chinese had no doubt prompted the attack on the expedition, but the lesson ought not to be thrown away on us, and we ought to learn how hazardous are these explorations, and with what caution we should enter on such undertakings.

Sir Henry Rawlinson, in a speech that was much cheered, said that no sort of rashness could fairly be imputed to us, for the Government of Peking had given us the fullest permission for the prosecution of the expedition, while he, for his part, knowing that risk must be encountered in all such international dealings, preferred to see such dangers boldly met than with a display of over-caution. He read, in conclusion, some interesting and touching extracts from Mr. Margary's most recent letter, written a few days before his death.

ROYAL SOCIETY OF LITERATURE (Wednesday, March 24).

SIR CHARLES NICHOLSON, Bart., in the Chair. Sir Gardner Wilkinson communicated a paper on "The Listening Slave and Slaying of Marsyas," in which he gave an account of a curious relief which he had seen and drawn so long ago as 1820, on a sarcophagus in the church of "San Paolo fuori le Mura," near Rome. This church, as is well known, was burned in 1823, and it is not certain whether this sarcophagus was wholly destroyed at the time, or is still partially preserved. Sir Gardner Wilkinson pointed out that the main subject was clearly the same as that the Italians call "L'Assotino," an excellent specimen of which he noticed and copied at Arles in 1829; and added that other representations of this myth may be found on ancient vases, and on various works of art.

FINE ART.

THE STUDIOS.—VII.

MR. WOOLNER, R.A., sends no work of importance to the Academy this year. He had intended to exhibit the cast of his recently executed statue of Lord Lawrence, from which the bronze has been taken; but it was so seriously injured in the process, that the necessary repairs could not be executed in time for the Exhibition. He is at

present engaged on a reredos for the chapel at Laton Hoo. In the centre is the crucifix, on either side of which are the figures of the Virgin and of St. John. The Virgin, gazing upwards towards her son, is fainting with anguish; St. John watches, ready to receive her in his arms as she falls. Mr. Woolner has found an incident which may not improbably appear to some rather startling. He has introduced on the left hand of the cross a vulture. The vulture comes to seek his natural prey, and retreats scared from the awful neighbourhood by the Divine Presence. Mr. Woolner has also a life-size statue of a celebrated Parsee merchant on the point of completion in the marble, and a small relief of the same person destined, we believe, for the University of Edinburgh, which is also nearly finished. Besides these works, he has also recently carried out on his own account a large bust of Tennyson. To this labour of love the sculptor has devoted himself with the conscientious zeal and unscrupulous energy habitual to him, and the bust is conspicuous for excellence in the best qualities which characterise Mr. Woolner's work of this class.

Mr. Rudolf Lehmann's half-length life-size portrait of Mr. Robert Browning gives great satisfaction to all the friends of both painter and poet. The figure is standing, the head slightly turned to the right, the right hand rests on the hip in an attitude which will be familiar to many. Mr. Lehmann has not addressed himself to the task of bringing out the power and vigorous character of his subject. That was successfully accomplished by Mr. Watts in his memorable profile. Mr. Lehmann has selected quite another moment of expression, not that in which we see the promise of production, but that which shows the instant of slackened effort. This, Mr. Lehmann has rendered faithfully and intelligently. An air of slight fatigue softens the accent of untameable energy which belongs to the less rare moments. The portrait is not so much of Mr. Browning the poet, as of Mr. Browning as he is known to his friends; and in this respect it will have a special value. Among other work by Mr. Lehmann which he will probably send to the Academy, may be mentioned a very pretty study of a little girl in a red jacket, caressing a black kitten, which she hugs close in her bare arms. The unconscious childish action, and the round, soft, childish contour come happily against a simple background of clear sky. *After the Dance* is another, and a more considerable picture also by Mr. Lehmann. The bright figure of an Italian peasant girl is seated by the wayside on a little grass-grown elevation. She gracefully poises her arms on the circle of the tambourine which rests upon her knees. An expression half of weariness, half of regret for past pleasure languishes in her face, and disposes her limbs with an idle grace. Behind her spreads itself a brightly luminous sheet of southern sky. The picture is, we believe, the property of Mr. Frederick Leland.

Mr. J. T. Nettlehip has just completed some excellent portraits of dogs. A magnificent specimen of that magnificent species the mastiff in repose but alert, a sleeping brown retriever, and a black retriever gravely investigating a friendly Norwegian pony in a paddock. The massive forms of the great mastiff are felt by the painter with genuine liking. He has got hold of and expressed a strong impression of the possibilities of enormous force which lurk about the beast. Full value is given to the dead weight with which the dog has stretched himself upon the floor, and to the solid front presented by the broad chest. The structure is so admirably felt and the whole so well animated by a look of character and intelligence, that we get an impression of pure strength free from any exaggeration or coarseness. The brown retriever also to a true dog-lover is delightfully and simply true. The surroundings in both cases have been wisely chosen from their respective homes. The mastiff extends himself on his well-accustomed rug with a rightful air of possession, and the retriever sleeps in his chosen

corner near a sheltering chair. The little portrait of the pony and his companion gains spirit from the same liveliness of interest in animals which Mr. Nettlehip shows in the other two pictures. The movement of both dog and pony is full of intention, the snuff and nosing which passes between them is vividly rendered, and the landscape background, the green-covered walls of the paddock, the half-open gate which admits through its iron bars of a partial glimpse of distant park, is pleasantly and effectively put in. E. F. S. PATTISON.

ART SALES.

THE fine objects of art of the late Countess Koucheloff, of St. Petersburg, one of the most important collections in Russia, was dispersed, on the 18th ult., at the Hôtel Drouot:—Greuse, *The Hermit*, one of his most celebrated pictures, which is engraved, 24,500 fr.; N. Poussin, *The Philistines struck with the Plague*, repetition of the painting in the Louvre, also engraved, 4,050 fr.; Gerard Dow, *Young Lady in her Balcony*, 15,200 fr.; Van Everdingen, *Scenes in Norway*, 1,730 fr.; Hubert Robert, two large paintings, 14 feet by 8 feet, fountains and buildings in ruins, signed and dated 1796, of exceptional execution, 3,650 fr. and 3,500 fr.; Karl du Jardin, *Players at Morra*, 3,000 fr.; A charming *Landscape* of Moucheron, with figures by Adrian Van de Velde, 8,100 fr.; Fynaker, *Landscape*, 3,650 fr.; ten genuine paintings by Joseph Vernet, which sold—*An Italian Sea-port*, of large size, 5,350 fr.; *The Bay of Naples*, 6,000 fr.; *Landscape with Waterfall*, 3,300 fr.; *Sea-piece*, 3,100 fr.; another, *with Rising Sun*, 3,000 fr.; a diamond rivière of fifty-one brilliants, 19,000 fr.; a tiara, 32,400 fr., and a plaque, 16,350 fr.; two colossal terminal busts of Flora and Ceres, of Ronen faience, 10,000 fr.; two bronze candelabra, Louis XVI. period, 10,500 fr.; two vases of Sèvres porcelain, 10,000 fr. The sale produced 292,640 fr. (11,705l. 12s.).

SOME modern pictures sold on the 23rd ult. at the following prices:—Achenbach, *Women at an Italian Fountain*, 4,000 fr.; Baron, *Rustic Concert*, 1,200 fr.; Corot, *Morning*, 3,800 fr.; *Evening*, 4,050 fr.; *The Fisherman*, 2,900 fr.; *Border of a Wood*, 3,800 fr.; Courbet, *Sea-piece*, 750 fr.; Delacroix, *Magdalen at the Foot of the Cross*, 1,220 fr., and *Young Lioness*, 1,400 fr.; J. Dupré, *Setting Sun*, 1,500 fr.; Fromentin, *Arab Horseman*, 3,100 fr.; Isabey, *Farmyard with Figures*, 4,550 fr.; Jacque, *Shepherd and Flock*, 4,000 fr.; Madou, *Flemish Interior*, 3,800 fr.; J. F. Millet, *Le bas Bréau*, 3,000 fr., and *Bathers*, 2,750 fr.; Pettenkofen, *Hungarian Horses at the Drinking Trough*, 3,180 fr.; T. Rousseau, *The Boat of Saint-Ouen*, 4,000 fr.; Roybet, *Acrobats*, 1,800 fr.; Herman Tenkate, *Interior of an Inn*, 2,400 fr.; Verboeckhoven, *Oxen and Sheep*, 1,200 fr.; Waldmüller, *The Indigent Family*, 3,550 fr.; Ziem, *Sailing Boats and Gondolas*, 2,000 fr., and *Embarkation at Vienna*, 3,000 fr.

At another sale on the 22nd ult., *A Village Fête at the time of Louis XV.*, by Le Prince, sold for 21,200 fr.

At the picture sale on the 19th ult. at Messrs. Christie, Manson and Woods', the prices obtained were:—Van Goyen, *A River Scene, with Cottages*, 210 gs.; Jacob Ruysdael, *A Woody Scene, with River and Figures*, 255 gs.; Morland, *Landscape, with Peasant and Dog tending Sheep*, 95 gs.; Old Crome, *A Wood Scene, with Figures*, 120 gs.; Raffaele, *The Martyrdom of St. Placida*, a composition of seven figures, in the artist's first manner, 188 gs.; Solomon Ruysdael, *A River Scene, with Church and Ferry*, 105 gs. The following day some water-colour drawings fetched the following prices:—Cooper, *Milking Time, Grassmere*, 365 gs.; Leader, *In the Uledr Valley*, 230 gs.; Birket Foster, *Feeding Time*, 190 gs.; E. Duncan, *St. Abbe's Head*, 124 gs. Paintings:—John Syer, *The Road to Beddgelert*, 295 gs.; W. H. Knight, *The Last Change*, 155 gs.; E. M.

Cooke, *Venice*, 130 gs.; W. P. Frith, *New Shoes*, 117 gs.; E. Nicol, *The Knotty Point*, 155 gs., and *Rejected Addresses*, 95 gs.; Horsley, *The New Dress*, 185 gs.

NOTES AND NEWS.

THE *Moniteur des Arts* states that a commission has been formed to raise by subscription a monument to the memory of Camille Corot, and that an exhibition of his works at the Ecole des Beaux Arts is being organised by the association of sculptors, painters and artists, under the sanction of M. Guillaume and of M. de Chennevières, Director of the Fine Arts.

A GERMAN translation, by Rudolph Valdek, of Condivi's *Life of Michel Angelo Buonarroti*, has just been published at Vienna, in Eitelberger's excellent series "Quellenschriften für Kunstgeschichte und Kunsttechnik."

RAPHAEL'S *Madonna di Tempi*, of the Munich Gallery, is one of those charming productions of his Florentine period in which the cheerful grace of Leonardo da Vinci is added to the purity and tender devotional feeling of the Umbrian school. It is well known, having been engraved already by seven different masters, but it is scarcely possible to have too much of such a very good thing, and the large engraving of it which the German engraver, J. L. Raab, has just executed will certainly be acceptable to all lovers of Raphael. In many respects this engraving excels all previous attempts, for Raab has expressed in it something of that soft beauty of colour that we find in all Raphael's works, and which it is so difficult to convey in a black and white reproduction. In order to gain this he worked, it is stated, chiefly from a water-colour copy of the picture that he had made himself, and which he kept constantly before his eyes during the tedious process of engraving. The Raphaelian mode of expression has also been happily rendered—neither exaggerated, nor enfeebled, and the modelling of the forms carried out with perfect mastership. The first impressions from the plate were taken in February, artist's proofs are now being issued, and proofs before letters will be taken in May. It is published by Friedr. Bruckmann, in Munich and Berlin.

A LONG letter on the subject of the Prix de Salon, concerning which there was so much difference of opinion last year, has appeared in most of the Paris papers. It is signed by six of the leading artists of France, and signifies their intention of declining to serve on the Salon jury this year in consequence of their disapproval of this prize, which seemingly reappears in the *Règlement* of the present year, though the article referring to it is not sufficiently clear to make it certain whether it has not undergone modification. In any case, however, discord would infallibly arise if they were nominated as jurors, and therefore they beg the voters to do them the honour of not returning them.

THE Mikado has applied to the painter Ugolini to execute full-length portraits of all the sovereigns in Europe, as well as that of himself and his wife. They are to decorate his residence at Takeo; and if these portraits are successful, it is the intention of the Mikado to found a school of Italian painting in Japan.

It is strange that the rich material that lies ready to the eyes and hands of artists in our great modern ironworks has not been more often seized upon for the making of pictures. Everyone who has seen the processes of smelting and forging iron cannot fail to have been struck with the many picturesque effects that they yield, effects such as Rembrandt delighted in—of glowing light in surrounding darkness, of mystic beams and strange shadows casting a spell of beauty upon the most commonplace objects. A painting by our rarely-seen native painter, Wright of Derby, was exhibited two or three years ago at the Old Masters

Exhibition at the Royal Academy, which represented the forging of a piece of iron with considerable skill and very fine effect; but excepting this, we do not remember to have seen any work by an English artist dealing with this subject. A German artist, however, has recently recognised his capabilities. In a great picture, called the *Cyclops' Workshop* (*Cyklopie*), upon which German criticism is now busy, Adolf Menzel has represented the interior of a large iron-foundry, with its giant steam-hammer, its blast and puddling furnaces, and its huge cylinders that roll out glowing masses of iron of many hundredweight as if they were soft paste. One of these glowing masses forms the centre around which the interest of Menzel's picture moves. It has passed through the first rollers and is being taken up with great tongs by the foremost workmen in order to be passed on to the second, a proceeding that involves a prodigious exertion of strength. Other workmen are employed in different processes; some direct the machinery; one in the foreground wheels away a newly-forged cylinder on a barrow, others are undergoing a very necessary process of purification and shirt changing, while others again are seen in a group in the dark background already beginning their midday meal. In the background of all is dimly visible the iron and steam monster that supplies the motive force for all this wonderful work. It will be acknowledged that here are splendid materials for a picture, only it wants a Rembrandt at least to deal with them. Herr Menzel is not a Rembrandt, but according to the *Berlin Post*, from which this description of his picture is taken, he has produced a powerful realistic work. He has worked for three years, it is said, on this one picture.

THE *Zeitschrift für bildende Kunst* is greatly taken up with Michel Angelo this month. 1. We have a short description of the statue of the youthful John the Baptist, in the possession of Count Rossetmini-Gualandi, formerly attributed to Donatello, but now affirmed by several distinguished artists and other good judges to be by Michel Angelo. (See note on the subject, ACADEMY, February 20.) 2. A critical essay by J. P. Richter on Michel Angelo's fresco of the Creation of Man, on the ceiling of the Capella Sixtina. And 3. A review of the German translation of Condivi's life of Michel Angelo, in which the reviewer brings forward several well-grounded reasons for supposing that the celebrated marble statue of the Madonna and Child at Bruges is not by the great master to whom it is usually so confidently assigned. He points out that not only Vasari, but also Condivi, whose accuracy is far less impeachable, speaks of the Madonna and Child that passed into Flanders as having been cast in bronze. "He also cast in bronze," says Condivi, "a Madonna with the Child on her lap, which was bought by some Flemish merchants for 100 ducats, and sent to Flanders." Vasari speaks of it still more definitely as a bronze "medallion," whereas the Madonna of Notre Dame at Bruges is executed most certainly in fine white marble. On internal evidence also this critic decides against the authenticity of the work, and unhesitatingly attributes it to one of Michel Angelo's pupils or imitators. Only the initials "C. V. L." are signed to this review, but we are informed in a note that it is by a distinguished Vienna sculptor, who for many years has devoted himself to the study of Michel Angelo's works. The other articles of the number are—a description by Carl Brun of two pictures by Mantegna, in the French provincial museum of Tours; the conclusion of Paul d'Albrest's notices of the new Opera House in Paris; and the conclusion of Beavington Atkinson's critique upon Landseer. The illustrations are very poor: one a smudgy etching by L. Fischer, from a landscape by Ruissdael, and the other a lithograph from Hildebrand's statue of the Sleeping Shepherd, a work which met with great success in Germany.

IN the March number of the *Nueva Antologia*, Signor Camillo Boito gives an account of an enormous mosaic now being executed in Salviati's studio at Venice. It is destined to go round the base of the new monument of Victory in Berlin, and is after a picture by the young artist Antio Wemer, lately appointed Director of the Academy at Berlin. Of this picture Signor Boito speaks in the most enthusiastic terms. It is divided into four principal groups: the first represents the provocation of France against Germany, and the surprise of the German people engaged in all kinds of peaceful pursuits at the outbreak of the war; in the second, we see the Germans preparing for the war, and here Prince Frederic Charles is the central figure; in the third, the rapid alliance concluded between the various German nations is represented; and, in the fourth, the creation of the new German Empire. The mosaic copy of the picture was begun last September, and is expected to be finished next September; unfortunately, the monument itself appears to be as poor in design and idea as to be unworthy of this decoration.

THE STAGE.

"ROSE MICHEL."

THE introduction of two or three horrible details, by one of which—the cry of a prisoner under torture—the action is helped and a theatrical "situation" obtained, might tempt one to class *Rose Michel* along with melodramas and the pieces with which the transpontine lovers of melodrama are most familiar; but the main motive of the piece is in the struggle between motherly love and a difficult duty, and this struggle as far as the dramatist is concerned is ably and ingeniously portrayed, and so the piece has some claim to take rank with those higher ones which deal exclusively with the study of human emotion and the development of character. The theme is a worthy one, and deserves worthy illustration. It does not, on the whole, get that, just now, at the Gaiety Theatre.

Rose Michel, in 1765, is the wife of a brutalised tavern keeper, whose wife is his slave and whose money is his god. She has one child—Louise—who, with M. Bernard, the gem engraver of Paris, has been brought up under better influences than she could have had at home. And in the first act, Rose visits her child at M. Bernard's house in the capital. The worthy gem engraver is informed of the death of the syndic, and immediately afterwards of his own appointment to that post, the goal of his ambition. So he passes from condolence to joy with an alacrity that would do credit to the Editor of a morning newspaper. He has an item of good news in store for Rose. His son Gilbert shall marry her daughter if only she can assure him that her husband, though a brute, is an honest one. And she gives him this assurance, believing in its truth.

The second act makes manifest that she was much too lenient. She finds her husband committing a murder; a murder for the sake of money. He has refused her any dowry for the marriage of Louise, and she, going down to the common room of the tavern, under the floor of which Pierre Michel has concealed his long accumulating treasure, gets the gold for the dowry, and is surprised by Pierre, who is bound on another errand. Hiding from Pierre she sees him go swiftly into the chamber of their guest, M. Grandchamp, and stab him instantly in his sleep. Grandchamp is the bad husband of a girl called Lucie, and has received a hundred thousand francs from a chivalrous youth on condition that he leaves her for America. The temptation is too strong for Pierre Michel, and the murder in a trice is planned and done. Coming out of the chamber, Pierre Michel finds his wife, struck with this significant revelation that Louise can now hardly in honour be the wife of Gilbert. That her daughter must lose her lover, through her father's crime, is her first

thought, followed instantly not by fear for her own life now at the ruffian's mercy, but by defiance of him and horror of his crime. With no timidity she beards him alone, and in Paris M^{de} Fargueil's defiant cry, "Assassin! Assassin!" has become a celebrated thing.

Rose has possessed herself of Pierre's ill-gotten money, and restored it secretly to De Buissey—the chivalrous youth who had given it to Grandchamp—and the youth, who thus learns the rashness of too much chivalry, is accused of the murder; the money being found again in his possession. He protests that he knows nothing, but protests uselessly. Rose Michel is the only soul, save Pierre himself, who can confirm his statement. She declares his innocence, but will bring no proofs, and the third act is devoted to the strengthening of her motive for making full disclosure. It prepares the way for the fourth act, as the first prepared the way for the second. The son's solicitation, his mother's entreaty, must do their part with Rose: the duty to good M. Bernard—after her assurance—has weighed on her, but the duty to these two is doubly pressing.

And in the fourth act, urged by the Judge in private—a friend of the De Buisseys, but an honest one—she does waver very much, and asks her daughter what it would cost her to give up her lover. And the simple girl says it would cost her her life; and that avowal of how much her love is engaged is too much for Rose Michel, and paralyses her action. There seems, however, one way out of the difficulty—if young De Buissey, now imprisoned in the Châtelet, can escape. Pierre, as the condition of Rose's silence, will aid the attempt, and under his wife's direction he is occupied in discovering a secret passage, when Rose hears the cry of De Buissey under torture, and rushes to the door with a shriek that they must open it, for she is "no longer a woman, no longer a mother, but a living conscience," and the right must be done. They open the door, but she is spared the misery of denouncing her husband, for soldiers, pouring in, find him planning an escape, and shoot him without waiting for explanations. Nor does there now remain any insuperable obstacle to the marriage of Louise with the worthy Bernard's son.

Mr. Campbell Clarke's translation of M. Blam's work is a thoroughly good one, and he has done wisely to leave the original pretty much where he found it. Many little points of ingenious construction are necessarily lost in our telling; but, certain horrors allowed for—either condemned or condoned—it is plain that the work is of seizing interest, dealing as it does from end to end with the conflict of strong and genuine emotions, and dealing with these with a robustness of which the Borough and the Outer Boulevards should not be allowed the monopoly. There are two things however of which the Borough and the Outer Boulevards are welcome to gain the monopoly—first, the sight of the knife with which murder has been done; and secondly, the hearing of De Buissey's cries under torture. With these things removed, the Gaiety performance would be more in keeping with the taste of most of its playgoers. But a much deeper objection may possibly be found to the enthusiastic reception of *Rose Michel* in England. The intense sentiment between mother and child in France—sentiment which is the motive of so much in French imaginative work—is perhaps not always understood by the middle-class British householder, who instead of a passion for one child, has complacent joy in a quiverful.

It is however upon situations and acting alone that reliance has been placed. There is no remarkable scenery: no special decoration: no picturesque groupings. A waiting-maid is unfortunately attired in raiment very much of our century, and the Comtesse de Buissey's drawing-room, though not mean or poor, is a little suggestive of the unsubstantial splendours of Tottenham Court Road. Nor—to come to other details—is there

much of local colour in the manners of the *dramatis personae*. There is too much hand-shaking for French society. Mr. Ryder's dignity and business-like precision will do for the French judge, and so will Miss Hollingshead's absence of affectation for the French *petite bourgeoisie*; but in the other characters, high and low, there is neither much of courtliness nor much of vivacity. These details help or hurt the effect of the piece, but the effect of this piece depends chiefly on the acting of Rose Michel.

Rose Michel is one of M^{me}. Fargueil's triumphs. At the Gaiety it is a failure. On a previous occasion we were at some little pains to point out what had seemed the unreasonableness of expecting from English artists, in a delicate and quiet piece of work, that excellence in acting which only high training and long familiarity with delicate and quiet work, can secure. The English artists were imperfect, but their shortcomings were inevitable. In the present case, nothing of that kind can be said. Here is a drama of strong situations and of emotions generally readily conceived. And if we have not got our M^{me}. Fargueil on the English stage, we ought to have her. Mrs. Gladstone is apparently a naturally earnest actress, with means strengthened by experience, but with little inventive power, and little grasp of a character as a whole. Like a walker on stilts, she strides from point to point; taking no account of the spaces between. Thus, she is vigorous, in the accepted fashion, at the great moments of the piece, but has never led up to them justly. The big words when they come—the “assassin” for instance, and the “living conscience”—are too big, not indeed for the situations in the drama, but for such sense of the situations as she has been able to convey. She has not succeeded either by personal charm or the adroit use of many details, quickly following one another, in interesting the audience in the character, and so a burst of passionate declamation still leaves the audience chilly—the person has not been made real, or touching to them. Mrs. Gladstone is far indeed from repeating M^{me}. Fargueil's triumph. Her performance is heavy, monotonous and untrue.

Miss Hollingshead gives to Louise Michel grace, tenderness, and quietude. Her voice and utterance are already excellent. More of illustrative action must come in due time. Miss Hollingshead, like the Bourbons, has something to learn—but unlike the Bourbons, she has nothing to forget. The ruffian, Pierre Michel, is earnestly played by Mr. J. C. Cowper, who if he errs, errs on the side of too much repulsiveness. As Bernard and Grandchamps, Mr. Maclean and Mr. Edgar have little to do. Mr. Hall is grotesque as the tavern-keeper's servant. Mrs. Howard appears as the Countess de Buissy. As her son, the wrongly accused, Mr. Edmund Tearle is somewhat wanting in intensity, and his long speech, in the first act, is declaimed monotonously; but in appearance he is satisfactory, and at times interesting. It is Mr. Ryder who brings to his part, of the friendly judge, a complete experience and discretion. His method of questioning the accused and the witnesses in the fourth act gives reality to a part of a scene which would otherwise surely lack it. Strongly acted, the play would have great qualities which would appeal even to an English audience; but it demands, in its principal interpreter, an art of which there is here hardly a sign.

FREDERICK WEDMORE.

THE Easter Festival was anticipated at the Royalty Theatre by the production on Thursday in last week of a novel cantata—the words by Mr. Gilbert, the music by Sullivan, and the subject a trial in the Exchequer. An action for breach of promise of marriage is one of the things which, even amidst the solemnity of a court of justice, an Englishman feels himself privileged to laugh at. On the boards of a theatre it should be doubly ridiculous, and at the Royalty it is in

truth sufficiently comic, Mr. Gilbert being, as the “Bab Ballads” have testified, an adept in the art of funny verse-making, and Mr. Arthur Sullivan having, as his version of *Box and Cox* may witness, a keen sense of the humorous capacities of music. So the public is well pleased with the entertainment at the Royalty, where something of the pomp and circumstance of a court of justice is happily mocked. In actual court, the trial of a breach of promise case reveals the weaknesses of the defendant—possibly of the plaintiff. But in the court in Dean Street, Soho, the weaknesses of all humanity are humorously revealed, and excused, if not justified. There is a chorus of jurymen, all perfectly aware that each in his time has been as fickle as the defendant—it being apparently a part of Mr. Gilbert's philosophy that nobody is much better than anybody else. There is a solo for the learned judge, who is at first inclined to recommend a compromise—not strictly in accordance with statute law, but who eventually decides to marry the young woman himself—he has previously accommodated Miss Nellie Bromley with a seat on the Bench. Mr. Gilbert's moral, Mr. Sullivan's music, and Miss Bromley's appearance are alike impressive. A wittier treatment of the subject is conceivable, though it might be difficult. Here the main reliance is on the broad satire, not so much on proceedings in Court, as on frailties in the world. Mr. Sullivan, the actor, befittingly represents the wisdom of the Judge, Mr. Fisher is the heartless defendant, and Mr. Hollingsworth the counsel for the plaintiff. The piece will be a popular success.

Conrad and Medora—Mr. Brough's burlesque produced some fourteen years ago at the Lyceum, just before burlesque of the coarser kind came in vogue—is the piece selected by Miss Litton to strengthen the programme at the St. James's Theatre, whither she and her company have moved from the Court, and where *Brighton* is nightly performed. That the company possessed, in Mr. W. J. Hill and others, some efficient actors of burlesque, was already known; but it was not known that Miss Litton herself was a valuable addition to a burlesque troop. Her performance is elegant, and this—combined with the appearance of Miss Henrietta Hodson, for the first time at this theatre—secures something that is attractive, and nowadays uncommon, in the rendering of burlesque. *Conrad and Medora* will not be relished by those who demand the loudest dresses, the most catchy tunes, and the greatest possible amount of slang; but it will be enjoyed by some of those who used to like burlesque when Mr. Planché wrote it.

FRENCH plays are once more to be seen in London. The Opéra Comique opened, on Easter Monday, for their performance, and M. Pitron, who was last year at the Holborn and Princess's, is again the manager. Were it not that there was a crowded audience on Monday night, the selection of *La Famille Benoiton* would not have seemed a happy one. Many of Sardou's comedies are directed at the follies of an hour: none more so than *La Famille Benoiton*; and its hour is past. To read the *Famille Benoiton* is like reading an old newspaper: it speaks of trifling things which are gone by. But at the Opéra Comique it is pleasantly interpreted, and was, on Monday, received with much applause. Our readers will gladly hear of the engagement of M^{lle}. Croizette and M^{lle}. Blanche Pierson for a limited number of nights. The one had the happiness to make a sensation at a theatre where sensations are made with difficulty; and the other is, in every sense, among the best of contemporary artists.

Hamlet has been performed during the week at the Surrey Theatre. Mr. Creswick taking the part of the Prince. His performance is well known as that of an experienced and judicious actor. Mr. Marston is the Ghost—as good a Ghost as can be got in London. Miss Marie Henderson is Ophelia.

THE Lyceum re-opened on Monday, as it was announced to do. The Lord Chamberlain has licensed the theatre to Mrs. Bateman, so that the series of high-class performances given there may be expected to proceed without interruption—a circumstance playgoers must welcome, if they care for good art. On Monday night, Mr. Irving gave that performance of *Hamlet* with which the whole town has made itself familiar; and Miss Isabel Bateman courageously undertook the part of Ophelia, as of old.

MISS NELLY POWER has reappeared on the stage, as it was said she would do. She acts Sir Kenneth in the burlesque of the *Talisman*, every evening, at the Philharmonic at Islington, and will doubtless draw to that distant quarter those who liked her vivacity when they saw it at the Vaudeville.

The Guinea Stamp—a drama of no particular merit—now precedes *Blue Beard* at the Globe Theatre. Mr. Lionel Brough and Miss Rachel Sanger appear in the new piece. It does not much matter what they play before *Blue Beard*, so long as that eccentric and lively performance is of itself sufficient to attract audiences.

THE *Merchant of Venice* will probably be acted at the Prince of Wales's Theatre on Saturday next; and next week will see the production of Mr. Farnie's new after-piece at the Strand.

David Garrick, with Mr. Sothorn, Mr. Buckstone, and Miss Minnie Walton in the principal parts, is to be revived, in two or three days, at the Haymarket.

MR. PHELPS and many members of the Gaiety company appeared at Manchester on Monday.

PURSuing his letters to the *Daily Telegraph*, the “London Manager”—who, as we last week mentioned, is understood to be Mr. Hollingshead—has come to the proposal of remedies for what he considers to be the abuse of authority at the theatres. He writes as follows:—

“It is often easier to point out absurdities than to suggest the best way to remove them, but in this case the task is not so difficult. The control of public amusements at the present time is a task requiring the undivided attention of a well-organised department. It ought to be concentrated in the hands of a public officer, and not an officer of the Crown, whose powers ought to be defined and enlarged; whose subordinates, especially surveyors, ought to be numerous; and who ought to be responsible to the Home Office. The defect of the Lord Chamberlain's authority is that it is at once too large and too limited. It is too limited in area, and too large in discretionary powers. We have checked arbitrary power in this country at the cost of much blood and treasure, and there is no reason why it should hold on to existence in the person of a Lord Chamberlain. Lord Chesterfield's memorable protest on the passing of Sir Robert Walpole's Act of 1737 is probably not forgotten. ‘If the players are to be punished,’ he said, ‘let it be by the laws of their country, and not by the will of an irresponsible despot.’ The present abuse of this discretionary power is shown in the case of Ash Wednesday. No warrant for even the general observance of this day can be respected in a Protestant country, and the restrictions on the players, and players only, which are powerless under the present licensing system over one-fourth of London and nearly the whole of the country, have little more than the antiquity of a century to recommend them even to the lovers of old observances.”

MÉLINGUE, the famous Boulevard actor of melodrama, has just died, in his sixty-third year. He was born at Caen, and came when young to Paris, and worked at first as a sculptor, on the Church of the Madeleine. He was afterwards a miniature painter, and then became an actor, and played for a long while in the French provinces and in more distant regions. At last he was engaged in the capital: at the Porte Saint Martin Theatre, with which his successes are closely associated. He appeared there in a long list of pieces, among which are the *Tour de Nesle*, *Benvenuto Cellini*, *Fanfan la Tulipe*,

le Bossu, and *Lucrece Borgia*. In these and many others he made manifest an artistic talent "plein," as one of his critics has written, "de mouvement et d'imprévu." His last part was at the Odéon, in the revival of *Ruy Blas*. Were it not that old Frédéric Lemaitre still lingers on the stage, it might be said that with the death of Mélingue the last great actor of *drame—drame de cape et d'épée*—has disappeared from the theatre.

Les Ingrats is the name of the last important piece produced at the Théâtre de Cluny. M. Jules Claretie is the author. The merit of the comedy does not lie in its action, but rather in the types of character—in their development—in the vivacity of the dialogue: the good things said by the way. For all that, it is a little diffuse. It is in four acts. The people are not all as ungrateful as the name would imply. One of the principal characters is a very good fellow, and another is not that, indeed, but an egotist pure and simple. This is one Letourneur, a banker, whose selfish desire with regard to the marriage of his daughter is the foundation of such plot as there is. A financier, Paturel, who has gained everything, though he began with nothing, helps to justify the title of the play. *Les Ingrats* is acted by MM. Laferrière, Esquier, and Mondel, and Mmes. Reynard and Geneviève.

CLAIRVILLE AND DREYFUS are the authors of the *revue* brought out at the Vaudeville, and called *La Revue des Deux Mondes*. Mlle. Massin, who has been in England last year in *L'Oncle Sam*, has an amusing part, and there is a pleasant prologue by M. Dreyfus, excellently recited by Mlle. Réjane, who was much remarked a few months back when she was leaving the Conservatoire.

THE Comédie Française, finding that the "starving system" has become too popular among some of its members, has put into force an article of its code for some time in disuse. This will limit the wanderings of certain artists whose journeys have thrown more than their due share of work upon the shoulders of their stay-at-home comrades.

MUSIC.

NEW MUSICAL PUBLICATIONS.

SEVERAL educational works and pieces of sheet-music have been for some time awaiting notice in these columns; and it will be as well to dismiss them before their number becomes excessive. In reference to new music, moreover, it may be said of the reviewer, *Bis dat qui cito dat*. It is impossible, however, in one article to speak in any detail of more than a dozen different works; fortunately, in the present case, a few words about each will be quite sufficient as a guide to our readers.

Taking first the educational works—Mr. Henry C. Banister's *Music* (Cambridge: Deighton, Bell & Co.), comes before us, bearing on its title-page "Third Edition." Those who know the little book would not have been surprised to have read "thirteenth" instead of "third;" for few more excellent little manuals exist in our language. Within rather more than 300 pages of small octavo is contained a really astonishing amount of matter. Beginning with the merest rudiments of music, the work treats then of the construction of the scale, of intervals, harmony, simple and double counterpoint, modulation, rhythm, imitation and canon, and fugue. Chapters are also given on form in composition, and on the compass of the different voices and instruments. Mr. Banister is a thoroughly experienced teacher, and (so far as we have tested his book) is as correct as he is clear. A valuable portion of the work is found in the exercises in composition, which occupy nearly fifty pages; and an excellent and complete index of subjects is given at the end. The book is in all respects worthy of

heartly recommendation, whether for teaching purposes, or merely as a book of reference.

Time and Tune in the Elementary School, by John Hullah (Longmans), is described by its author on the title-page as "a new method of teaching vocal music." He further tells us in his preface, that some three years since he set to work to prepare a new edition of his former book—his adaptation to English use of Wilhelm's method—with such improvements as the experience of years had suggested, but that as he proceeded he found that he was really at work on, not a new edition, but a new book. The result is the present volume. Mr. Hullah still adheres, of course, to the employment of the fixed *Do*, though with considerable modifications of detail. Into the controversy between the "fixed" and the "moveable" *Do* there is no occasion now to enter; both have ardent advocates, and to those who teach on the former system the present work will be heartily welcome. The exercises are very numerous, and carefully graduated in point of difficulty; and the author has shown much taste, as well as considerable ingenuity, in the tunes and part-songs which he has composed to illustrate the various intervals. The exercises are also printed without the text, in a separate form, and at a low price, for the use of classes.

Twenty-four School Songs, for First and Second Trebles and Bass, by T. Orampton (London and Glasgow: W. Collins, Sons & Co.), are printed in the Tonic Sol-fa notation, and will, therefore, be available in the large number of schools where that system is taught. They are simple, melodious, and well adapted to their purpose.

A work of a somewhat similar character as regards its form is Mr. F. Leslie Jones's *Songs for School Use* (Longmans), which are arranged for two trebles with pianoforte accompaniment. These, however, cannot be so unreservedly commended as the last named, because Mr. Jones has entirely disregarded the good old rule that in writing two-part songs the harmony for the voices alone should be quite correct independently of the accompaniment. This is by no means always the case in the present pieces; indeed, even with the piano, the effect of the harmony is occasionally somewhat uncomfortable. In other respects the book is good.

A Tract on Musical Statics, by John Curwen (Tonic Sol-fa Agency), is a work which contains so much useful and valuable information on the subject of harmonics, the relations and derivations of chords, and kindred subjects, that it is impossible not to feel deep regret that Mr. Curwen should (very naturally) have adapted his book so exclusively for Tonic Sol-faists that to musicians unacquainted with that system some of it is simply unintelligible. In spite of this drawback, nevertheless, it gives such an amount of interesting matters relative to the recent discoveries of Helmholtz, Professor Tyndall, and others, that even by those who are not Tonic Sol-faists it can be read with interest. If a second edition is published, it would be worth Mr. Curwen's while to give after the sol-fa names those in ordinary use. The general acceptability of the book would thereby be much increased.

Coming now to sheet-music, there is first to be noticed a number of songs, duets, and part-songs by an American composer, F. Boott, whose name is new to us. These are published by the firm of Oliver Ditson and Co., of Boston (U.S.). There is no occasion to give the list of their names, as they are of no very remarkable musical interest—at least in this country. Mr. Boott has a flowing vein of melody, somewhat of the "Christy Minstrel" type; and American musical taste seems to be so different from that of the English public, that there is great probability that across the Atlantic they would be very popular. They are undeniably pretty, but in no respect great.

"Ad Ohloen," by Horace (Ode xliii., Book 1), set to music by Charles Salaman (Cramer & Co.), is published both with the original Latin text, and

adapted to Lord Lytton's English translation. It is one of those elegant little pieces which Mr. Salaman knows so well how to write—full of taste, and, it is almost needless to add, showing the practised hand of a thorough musician.

Franz Liszt's "Thirteenth Psalm," his very pleasing "Chorus of Reapers," from *Prometheus*, and Schubert's *God in Nature* (Stanley Lucas, Weber & Co.), were spoken of by me so recently in noticing Mr. Walter Bache's concert, that it is unnecessary here to do more than call the attention of readers to the fact of their being published in a cheap edition. The printing is very good, and the form is a large octavo. Messrs. Lucas, Weber & Co. are doing excellent service to art in this country by their cheap republications of modern German music.

"Duo Brillant à quatre mains pour le Piano," par Charles Edward Stephens, Op. 19 (Schott & Co.), is one of those works that occasionally (unfortunately but too seldom) appear, which prove that English musicians are not unworthy to compete with their German brethren in the higher forms of composition. The present, though not so entitled, is in reality a grand sonata in three movements, constructed strictly in classical forms, and amply developed. The first allegro is built on pleasing, though somewhat Mendelssohnian subjects; the second movement is an andante with variations (or, as Mr. Stephens prefers to call them, "parafrasi") in the contrapuntal style, and the finale is exceedingly bright in character, and of great brilliancy. Throughout the whole duet not only is the interest well sustained, but the thematic treatment and the command of counterpoint are such as to place the work far above the average of new pianoforte pieces, and to entitle it to the epithet "classical." It is not very easy, but under the hands of two good players will be found extremely effective.

The *Organist's Quarterly Journal*, Part 25, edited by Dr. W. Spark (Novello, Ewer & Co.), contains a "Marche Triomphale" by Frederick Archer, two Preludes by Ludwig Thäl, a Concert Fantasia by Leopold de Prins, and an Andante by F. J. Read. As regards the quality of the compositions, our countrymen have decidedly the best of it. Mr. Archer's march is bold and spirited, and Mr. Read's andante, though unassuming in form, contains some very nice writing, and will be found useful as an introductory voluntary. On the other hand, Herr Thäl's preludes, though smoothly written, are somewhat colourless, and M. de Prins' Fantasia I am inclined to describe as "much ado about nothing." It is in the variation form, founded on a rather commonplace theme, and full of *ad captandum* effects for "vox humana," tremulant, &c., in the modern French style. Lovers of that style may admire it, but it is doubtful whether others will.

EBENEZER PROUT.

CRYSTAL PALACE CONCERT.

As usual during Passion Week, last Saturday's concert at the Crystal Palace consisted entirely of sacred music; and it must be added that a more interesting selection than that offered to those present could hardly have been brought forward. The chief feature of the afternoon was the first production in this country of Bach's great church-cantata "My spirit was in heaviness" ("Ich hatte viel Bekümmerniss.") The "Kirchen-Cantate" was a species of composition of which Bach has left many examples; more than 220 exist out of a much larger number which he is believed to have written. In form these works may be generally described as long anthems with orchestral accompaniment. Perhaps the nearest parallel to be found to them is in such music as that of Handel's Chandos Anthems, or in the few specimens of cathedral music in which the orchestra is introduced. There is, however, one important point of difference. In Bach's cantatas great prominence is generally (though not invariably) given

to the choral, which, as I have previously had occasion to remark in these columns, has in Germany a special significance to which no counterpart is to be found in our English psalm-tune. Every choral being wedded to its own hymn, the melody has its own associations which are awakened in the minds of the audience quite apart from the words to which it may be set in the cantata, or even when, as sometimes happens, it is given to instruments alone. In some of these "Kirchen-Cantaten" the opening chorus is founded on such a choral; even more frequently one is introduced at the conclusion; and sometimes (as in the work performed on Saturday) it is found in one of the intermediate movements. In form, again, these cantatas are most varied; some have only three or four, others as many as ten or eleven movements; some are for solo voices but few instruments accompanying, while others are laid out for a chorus and very large orchestra. The variety of their style equals that of their form; and it may be safely asserted that he who knows not these remarkable works has but an imperfect idea of the range and versatility of Bach's genius.

Of the entire series of the Church-Cantatas, there is probably none finer than the work which Mr. Manns had selected for performance. It is one of the longest of its class, containing eleven movements, and is (like most of the larger cantatas) divided into two parts, the first of which was intended to be performed in divine service before the sermon, and the second after it. A detailed analysis of the whole work would occupy too much space; those who are interested in the subject will find an excellent one in the first volume of *Bitter's Life of Bach*, pp. 221-230. There are some points, however, which must be noticed. First of all is the most singular resemblance between the theme of the opening chorus and that of the trio "The flocks shall leave the mountains" in Handel's *Acis and Galatea*—a resemblance not merely in the melody and key, but extending to the actual treatment of the subject by imitation in the seventh at half a bar's interval. Handel was such an unblushing appropriator of the thoughts of others that one would be inclined to suppose he had taken Bach's subject were it not improbable that he ever had the opportunity of hearing the work. Bach's cantata was composed in 1714, but never published till 1856, when it appeared in the fifth year's issue of the Bach Society's works. *Acis and Galatea* was written about 1720; and though it is known that Handel was in Germany about 1717, it seems very unlikely that he should have happened to hear the cantata there. The coincidence is one of the most remarkable in the range of music—perhaps only to be paralleled by that existing between the close of the *Midasumner Night's Dream* overture and the "Mermaid's Song" in *Oberon*, which can also be proved by dates to be merely a coincidence.

To return, however, to the present work: one hardly knows whether more to admire the choral or the solo portions. The final chorus of the first part, "Wherefore grievest thou, O my spirit," is a magnificent example of Bach's clear fugal writing, which, however, fine as it is, is surpassed by the concluding fugue, "Praise and honour and glory and power," a movement worthy to stand by the side of Handel's setting of the same text in the *Messiah*. Almost more remarkable as a characteristic specimen of Bach's treatment of the choral is the movement "Now again be thou joyful," in which the choral, "Wer nur den lieben Gott lässt walten" (familiar to English audiences from its introduction as "To thee, O Lord, I yield my spirit," in *St. Paul*), is treated with such masterly effect. While three solo voices (soprano, alto, and bass) are singing in strictly imitative passages, the tenor chorus enters with the first verse of the choral in a manner as striking as it is novel. For the second verse, the alto, tenor, and bass chorus take up the fugal subject, while the soprano voices sustain the choral as a *canto fermo*

above the moving harmonies; and with all this scientific contrivance the music is as clear and intelligible as the simplest part-song. In the art of concealing his art Bach stands unrivalled; among modern composers Mendelssohn only has approached him.

In many of Bach's Church-Cantatas are to be found songs which, to modern taste at least, are stiff and antiquated. Such, however, are not the solo portions of the present work, which are, with one exception, in his best manner. The soprano air "Sighing, weeping," with its beautiful oboe accompaniment, the exquisitely pathetic tenor song "Fast my bitter tears are flowing" (one of Bach's finest inspirations), and the charmingly melodious duet for soprano and bass "Come, my Saviour, and restore me," are fully worthy of the choral parts of the cantata. The tenor song, "Rejoice, O my spirit" is less happy, being more old-fashioned in style.

The performance as a whole was a very good one. Mr. Manns had evidently taken great pains with his chorus; for their singing of the by no means easy fugues was particularly steady. The solo parts were sustained by Miss Blanche Cole, Miss Palmer, Mr. Edward Lloyd and Mr. Whitney, none of whom need praise in these columns, while the orchestra was as excellent as usual. Franz's judicious additional accompaniments were used, greatly to the enhancement of the general effect. Only one important blemish marred the performance. What could have induced Mr. Manns to cut out the song "Fast my bitter tears are flowing," which is unquestionably one of the gems of the work? If it were necessary to omit anything, the other tenor song "Rejoice, O my spirit," could have been far better spared. Should the work be repeated, it is to be hoped it will be given in its entirety.

A second most interesting novelty on Saturday was Schubert's song "Die Allmacht," arranged for tenor solo with male-voice chorus and orchestra, by Liszt. Whatever may be thought of the principle of such transcriptions—and for myself I must confess I do not approve of them—there can be no question as to the magnificent effects which Liszt has obtained in his arrangement. If ever the end justifies the means, it does so here. The treatment of the male chorus is most felicitous, and the orchestration is superb. The music is highly characteristic of Schubert, alike in the romantic tone of its melody and the boldness of its modulations. The performance was admirable, the tenor solo being excellently sung by Mr. Lloyd, and the applause was so warm as nearly to elicit an encore.

The remaining pieces of the concert were the overtures to *St. John the Baptist* (Macfarren) and *Athalia*; an uninteresting song, "Mea tormenta," from the oratorio of *Maddalena*, by Haase, sung by Miss Palmer; the air "O God, have mercy," from *St. Paul*, given by Mr. Whitney; and the second and third movements of the *Lobgesang* symphony, which were played by the band in place of the announced Adagio and Rondo for violoncelle and orchestra, which was to have been performed by Signor Piatti—for whose absence, however, an apology was made on the score of illness. The concert, which was one of the most enjoyable of the season, had the further advantage of being of only reasonable length. This afternoon Mr. Carrodus is announced to play Macfarren's violin concerto, which will be heard on this occasion for the first time at the Crystal Palace.

EBENEZER PROUT.

BRACHES'S "Deutsches Requiem" was produced for the first time in Paris on the 28th of last month. The last number of the *Revue et Gazette Musicale* contains a long critique of the work from the pen of M. Adolphe Julien. Although M. Padeloup, who directed the performance, injured the effect of the work by the omission of two entire numbers and part of a third, the im-

pression produced appears to have been very favourable.

At the last Concert du Châtelet the first act of a "drama biblique" entitled *Samson*, by M. Camille Saint-Saëns, was produced. The music is spoken of as elevated in feeling, but complex and not very popular in style.

A GRAND concert was given in Buda-Pest on the 10th ult., at which Franz Liszt's new composition "Die Glocken von Strassburg" was performed. The programme also included fragments from Wagner's *Ring des Nibelungen* and Beethoven's concerto in E flat, played by Liszt.

It is announced that the Berlin Wagner Society intends to give a concert in that city, at which, among other things, the fragments of the *Götterdämmerung*, recently performed with such extraordinary success at Vienna, are to be brought forward. A concert is also to be given at Grätz in aid of the Bayreuth enterprise, for which Wagner has given permission to perform some numbers from his *Walküre*.

A PERFORMANCE of Schumann's *Rose Pilgerfahrt* has lately taken place at Berlin, in which the conductor's bâton was in the hands of a lady, Frau Dreyschöck, a teacher of singing in that city.

THE distinguished violinist Ferdinand Laub died on the 17th ult. at Gries, near Bozen, to which place he had gone for the benefit of his failing health. Laub was born at Prague, on January 19, 1832; his father, Erasmus Laub, was a musician in that town, and from him the son received his first musical instruction. He subsequently studied at the Conservatorium at Prague, and after making various professional tours through Europe with the greatest success, he accepted an engagement as Professor at the Conservatorium at Berlin. He subsequently filled similar posts in St. Petersburg and Moscow, resigning the last through ill-health in 1873.

No. 153, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

John Knox and the Church of England, his Work in Her Pulpit and his Influence upon Her Liturgy, Articles, and Parties. A Monograph, founded upon several Important Papers of Knox never before published. By Peter Lorimer, D.D., Professor of Theology, English Presbyterian College. (London: Henry S. King & Co., 1875.)

THIS is a remarkable book and will doubtless attract attention in connexion with the religious controversies of the present time. As to the particular use which may be made of its revelations we shall pronounce no opinion; but the author seems unquestionably to have added some very important details to the history of the English Prayer Book, and the facts now for the first time made known to us ought to have an interest for many besides theologians. To the Scotchman who glories in the work of John Knox it must be gratifying to know how that Reformer made his influence felt in the councils of Edward VI., while to English Churchmen, whether divines or laymen, it must be deeply interesting to trace the origin of some of the most distinctive features of the Book of Common Prayer.

One of the most singular things about this discovery is the quarter from which it comes. The MSS. containing the evidences of these new facts in the history of the Church of England have been for a couple of centuries in the custody of Dissenters, and were discovered by Dr. Lorimer in Dr. Williams's library,—among papers, too, which had already been used by Neal in his *History of the Puritans*, besides having been examined by several other investigators. How it was that the name of Knox in three separate documents failed to attract attention till now is a matter not easy to explain, unless it be, as suggested by Dr. Lorimer, from a too hasty presumption on the part of Neal and those who followed him that the papers must have been already printed. This supposition, perhaps, may have been encouraged by the fact that the MSS. were none of them originals; but it appears that, in the opinion of good judges, they are contemporary transcripts. As to their authenticity, the internal evidence is so strong that we imagine this will hardly be called in question.

From these remarkable documents we gather the following particulars. In the month of October, 1552, just before the general publication of the Second Prayer Book of Edward VI., John Knox—who was

then residing at the English Court as one of the Royal Chaplains—received, in conjunction with five others, the royal command to consider and report upon the “Articles of Religion,” at that time forty-five in number, which were embodied in the publication. He had just then made a great impression upon the Court by a sermon preached before the King, in which he strongly denounced the practice of kneeling at the Communion as savouring of idolatry. As yet kneeling had been kept up in the Church of England only by the authority of custom. It was not expressly enjoined by any rubric, and Knox himself had invariably directed his congregations at Berwick and Newcastle to receive the elements sitting. But there was a specific direction in the new Service Book that the communicants should kneel; and it was required by the 38th Article that the whole contents of the Book should be recognised by the clergy at their ordination as wholesome, and in accordance with the spirit and freedom of the Gospel. The Book had been appointed by Parliament to come into use in all churches on November 1. Already a number of copies had been printed. If a protest was to be made against anything, no time was to be lost. A report was drawn up by Knox in the name of the Six Royal Chaplains, in which he insisted strongly on the objections to the practice of kneeling and intimated that the express injunction to kneel would prevent their unqualified acceptance of Article 38.

The scruples that had been previously mooted on this subject had already been referred by the Council to Cranmer, with a suggestion that he should consult with other learned men as to the advisability of omitting the new rubric altogether. Cranmer promised to do so, but intimated that in his opinion the subject had been very fully considered by the bishops and other divines to whom the revision of the Book had been entrusted; and he pointed out the grave inconvenience of again altering a document which had been read and approved by Parliament. He also gave his own reasons for considering the objections to kneeling untenable in a religious point of view, and hoped their lordships would not be moved by “glorious and unquiet spirits, which can like nothing but that is after their own fancy.” What further report he made to the Council after consultation with other divines does not appear on record; but the final result of Knox's remonstrance and the archbishop's answer thereto was “a certain declaration signed by the King's Majesty” and ordered to be inserted in the new Prayer Book at a Council held on October 27. That declaration was substantially the same with the rubric now at the end of the Communion Service; but a few lines of preamble, which are now omitted, are remarkably significant as to the spirit of compromise in which it was originally framed. The words were as follows:—

“Although no order can be so perfectly devised, but it may be of some, either for their ignorance and infirmity, or else of malice and obstinacy, misconstrued, depraved, and interpreted in a wrong part: and yet, because brotherly charity willeth that, so much as conveniently may be, offences

should be taken away; therefore we, willing to do the same; whereas it is ordained,” &c.

The “Declaration,” as Dr. Lorimer truly remarks, has all the appearance of having been drawn up by Cranmer. It is eminently conciliatory, and it seems to have been effective in retaining within the same communion men whose opposite leanings might otherwise have broken up the Church, and led to the general adoption of narrow and bigoted views. Knox counselled his congregation at Berwick not to withstand the authorities, but to accept the new rule with a protest against any superstitions that might appear to be involved in it. If they were not to be at liberty to sit, the declaration saved the consciences of the Puritanical party in kneeling; and so important was this object esteemed to the peace of the Church of England, “that the King and Council dangerously stretched the prerogative of the Crown in adding it to the Prayer Book without the consent either of Parliament or Convocation.” The Book, however, had already passed through the press and received its final corrections when the insertion of the Declaration was thus decreed. All that could be done was to print it on a separate leaf, to be inserted by the binder at the end of the Communion office. The pagination showed that it had been an afterthought, and a number of copies of this first edition of King Edward's Second Prayer Book still exist in which the intercalary leaf appears never to have been inserted.

Such was the origin of one of the most important rubrics in our English Liturgy. Its subsequent history was no less remarkable. Under Elizabeth it was again removed from the Prayer Book, and was only restored to its place a hundred years later. Framed originally to satisfy the Puritans, it was felt to be necessarily obnoxious to the Romanists, whom it was desired, if possible, still to retain in allegiance to the National Church. For a whole century the Church forbore positively to declare that the sacramental bread and wine remained in their natural substances, and that the natural body and blood of Christ were in Heaven and not here. But as time went on the breach between Rome and England became more manifestly irreconcilable. The Church of England herself was submerged in the waves of Puritanism; and in the new settlement of 1662 all efforts to conciliate the Catholics were very naturally abandoned. So the rubric on kneeling was again restored to its place, to become, in course of time, again a great subject of discussion, even to the present generation.

Dr. Lorimer's book is avowedly an attempt to rewrite, from the new materials found by him, “the English chapter of Knox's life.” And he undoubtedly has succeeded in showing that those new materials have a biographical value in relation to other matters than the particular transactions above referred to. But the main interest of the Book centres in the point to which we have drawn attention; and the only criticism we have to make upon the mode of treatment is that we think the author would have done well to confine himself a little more strictly to the new documents which he has been so fortunate as

to bring to light. New materials for history are in themselves a treasure which should always be given to the public with as little delay as possible, and with no more comment than is necessary to bring out their importance. The time for writing histories, biographies, and even monographs, will come afterwards, when the whole of the original information on the subject has been thoroughly well digested and thought over. If Dr. Lorimer had allowed himself time for a more exhaustive examination of other sources of information, he surely need not have troubled himself to transcribe with his own hand at Oxford, and print at the end of his book, a treatise like the life of Dean Whittingham, which has already been carefully edited, with a great deal of useful annotation, by Mrs. Green in the sixth volume of the *Camden Miscellany*. His discoveries are valuable enough in themselves without any such appendix; while, on the other hand, if he had aimed, as he tells us he did not, at anything like a complete history of the Puritan movements of the period, the republication of this tract would have been quite superfluous.

JAMES GAIRDNER.

The Principles of Economical Philosophy.

By Henry Dunning Macleod, Esq., M.A.
Vols. I. and II. Second Edition. (London: Longmans & Co., 1875.)

At a time when distrust of political economy as consisting largely, in its present state, of deductions from unverified and inadequate assumptions, is widely spread and daily growing, Mr. Macleod comes forward "to build up and erect a great inductive science of economics on solid and durable foundations." The foundations on which he builds should be solid enough if laying them over and over again could make them so. His second volume is mainly a reiteration, often in the same words, of the doctrines of the first, itself abounding beyond measure in repetition. From both we shall try to indicate briefly their author's leading conceptions of economic philosophy. We meet at the outset with a difficulty. Although Mr. Macleod insists on the vital importance of the proper definition and consistent use of economic terms, his own definitions are surprisingly fluctuating and contradictory, beginning with political economy itself. "There are," as he says, "two great divisions of inductive science, Physical and Moral;" and in the same page he calls political economy, in emphatic capitals, "a Physical Science;" subsequently, summing up an elaborate discussion: "These considerations will be sufficient to satisfy all persons of competent knowledge that Economics is essentially a Physical Science." Nevertheless, he repeatedly terms it "a Moral Science;" in one passage pronouncing that "Economics, a Moral Science, is fitted to take rank by the side of Mechanics and Optics as a great Positive Inductive Science." It is an intelligible, and, in our own view, the true conception of political economy that it seeks its premisses in the phenomena and laws of both the physical and the moral world; the theory of population, for example, and the theory of rent being drawn from both. But this does not

appear to be Mr. Macleod's meaning, and his language would ill express it, if it were. Again, although he emphatically contends that political economy is "an Inductive Science," and adopts M. Say's description of it as "experimental"—a term for which he afterwards substitutes "experiential"—he also speaks of it as a "mathematical" and an "exact science." A science engaged in the inductive investigation of phenomena, seeking and verifying its premisses, must surely be far remote from the condition of an exact science, arriving with mathematical certainty and precision at all its conclusions. Yet Mr. Macleod in the same breath calls political economy a mathematical science, and affirms in opposition to Mr. Senior that

"a thorough knowledge of the entire mechanism of commerce is absolutely indispensable to enable anyone even to see the facts of economics; and to devise a theory of the phenomena indispensably requires a knowledge of physical science, and the methods of reasoning which have brought the various sciences to their present state."

Political economy is thus, according to Mr. Macleod, at once a moral, a physical, an inductive, experimental, and experiential, a mathematical, and an exact science; it is also, as he boasts of being the first to discover, "a distinct body of phenomena based on a single idea." And he asks:—

"If then political economy is a physical science, it must be some large body of phenomena, all based upon some single conception. The question therefore is—What is that body of phenomena, all based upon a single idea, to which the name of economic science may be applied?"

Before considering Mr. Macleod's answer, we must suggest to him that a science is the theory or interpretation of phenomena, not the phenomena themselves, otherwise the phenomena would change with all the changes in theory. Moreover, a conception may be based on phenomena; but how can phenomena be based on a conception? Or is it true of the physical sciences—chemistry, geology, physiology, for example—that each is based on a single idea? The method of investigation in economics, which Mr. Macleod, combating the *à priori* method, puts forward as equivalent to experiment in physics, is the following:—"In political economy we can have what are in all respects equivalent to experiments, namely feigned cases. We can argue from feigned cases and deduce principles from them with the same certainty as if they were real cases." Fictitious assumptions have been the bane of political economy. In place of investigating the actual phenomena of the economic world, the actual division of occupations, actual wages, profits, and prices, the real motives of men and women, the real conditions under which they operate, and their real results, the *à priori* school of economists have sought to obtain "the laws which regulate the production and distribution of wealth," by the very process of "feigning cases," which Mr. Macleod extols. They have "feigned" an unimpeded pursuit of wealth, a universal knowledge of the gains and prospects of every occupation in all places, and a perfect facility of migration; and from these fictions they have reasoned "with exactly the same certainty as if they were real cases." The result is that political economy has become

a by-word for hasty assumption and bad generalisation.

The "single idea" on which Mr. Macleod proposes to base a science of wealth is that the quality which constitutes wealth is exchangeability, and therefore debts, bills of exchange, promissory notes, being exchangeable, are, like material productions, new creations of wealth:—

"With the first debt that was created among men a new species of property sprang into existence; and when this property was made saleable, a new species of wealth was created, which has produced greater effects on the fortunes of mankind than any other."

A has 100*l.*; B expects 105*l.* six months hence, and exchanges his expectation for A's 100*l.*, who takes his promissory note in evidence of a right to the 105*l.* What new wealth has been created? A has given his 100*l.* for B's expectation, not for his note, which is valuable only as legal evidence of his claim. This might be proved in other ways, by an entry on a register for example, just as the right to land is transferred on the Continent by registration. If the promissory note creates new wealth in proportion to the sum it acknowledges, so does an entry on a register, or the title-deed to an estate. Mr. Macleod argues that a new right has been created, which has a saleable value; but what has really taken place is simply an exchange of rights. B has now a right to A's 100*l.*, and A has a right to recover 105*l.* six months hence, which otherwise B would have a right to keep. Mr. Macleod, however, insists:—

"It is certain that the quantity of debts in circulation amounts to many hundreds, if not thousands of millions of money in value. Yet it would startle many persons to tell them that these debts are so much wealth, as much as an equal amount of gold and silver; and yet every lawyer, every merchant, every economist knows that they may be made of exactly the same value, and perform all the functions of money."

We should suppose that every lawyer and economist but one, every merchant without exception, knows that they will not perform all the functions of money, that they will not pass everywhere and at all times like money, and that they do not, like money, possess value independent of the things which they signify.

Mr. Macleod justly enough calls the theory of Law that a paper currency cannot be issued in excess so long as it represents property, a stupendous fallacy; but how are we to characterise his own doctrine that every promissory note creates new wealth equal to the amount it professes to represent, even when it transfers existing wealth to a spendthrift? With great modesty Mr. Macleod describes his own argument against Law's theory as "one of the most beautiful triumphs of pure reasoning to be found in any science." Law's theory had been very simply refuted by Mr. Mill, who showed that, as a given sum of currency circulates commodities of many times the same pecuniary value, a paper currency issued on the security of property of all kinds would be in excess in the ratio of the rapidity of circulation. Mr. Macleod's "beautiful triumph of pure reasoning" is the following:—

"Money does not represent commodities at all, but only debt, or services due which have not

yet received their value in commodities. Law's paper currency became redundant, and swamped everything. And the reason is plain. It was a violation of the fundamental principle we have obtained—where there is no debt, there can be no currency."

A gold-miner finds a nugget, and coins it at the Sidney Mint into a hundred sovereigns; what debt does the money represent? Had he been a coal-miner, and dug up a hundred pounds worth of coal, would not the coal too represent debt if the gold does? Money circulates both commodities and securities, or debts if Mr. Macleod chooses to call them so; it is not properly said to "represent" either, but if it represents either, it represents both.

On "the great general conception" that all things which are exchangeable, including debts, are wealth, Mr. Macleod bases his definition of political economy as the science of exchanges:—

"We have at last found that great general conception of which we were in search; and from this conclusion it follows that if political economy be the science of things, so far as regards their being wealth, it must be the science of them with regard to their exchangeable relations, and that only."

This definition makes no place for the theory of population, or of the physical conditions limiting agricultural produce, or of the moral conditions which govern the accumulation of capital, and it includes only one mode of distribution. "How," he asks, "is wealth distributed? By no other method than that of exchange." Have the small farmers of the Continent, then, no wealth save the produce which they bring to market? Are there no laws of succession? Does the family play no part in distribution such as German economists point out? Distribution has undergone curious mutations of meaning in English economics. In the first book of the *Wealth of Nations*, Adam Smith, under the head of "Natural Distribution," treated only of exchange, but he subsequently discussed the distribution effected by laws of succession. Mr. Mill afterwards showed that exchange is only one of several modes of distribution. Some succeeding economists, however, misapprehending Mr. Mill, separated distribution from exchange as a distinct subject of economic enquiry, in place of treating it as the genus of which exchange is a species. Mr. Macleod finally excludes from the economist's consideration all modes of distribution save exchange.

Mr. Macleod's book contains some historical information and evidence of industrious research, showing that with modester ideas and aims he might make some useful contributions to economic enquiry in detail; but his confusion of thought and inaccurate and inconsistent reasoning and language combine with grotesque vanity to unfit him altogether for the task he has undertaken of reconstructing economic philosophy.

Mr. Macleod reiterates his claim to be the original discoverer of the principle that the Bank of England should regulate the rate of interest so as to prevent the exportation of bullion. "Now it is the weak point in the Act of 1844 that it takes no notice of this grand principle; it takes no precaution that the directors of the Bank of England shall

recognise it." The power of the Bank over the rate of interest is the result mainly of the manner in which other banks keep their reserves, and rests on no permanent foundation. Mr. Macleod much overrates his discovery. We will only add that amid the parade of learning in his volumes there is no indication of acquaintance with any German author. German economists, however, are not unacquainted with his works, and we recommend him to study the criticisms of Roscher and Carl Knies.

T. E. CLIFFE LESLIE.

Sketches of Old Times and Distant Places.

By John Sinclair, M.A., Archdeacon of Middlesex. (London: John Murray, 1875.)

ALTHOUGH, by the author's own showing, these sketches represent nothing more than the holiday work of a septuagenarian whose habits are too active to brook "complete mental stagnation" even during an autumn at the sea-side, Archdeacon Sinclair's compromise with his medical advisers is matter for congratulation to the reading public. His birth, connexions, nationality, and engagements more or less professional, have concurred to make the list of "people he has met" a large one; and during a long life he appears to have had such a mixture of observation and adventure in his composition, that he might lay some claim to the character which Homer gives Ulysses in the third line of the first book of the *Odyssey*. The son of one of the most active-minded statisticians and philanthropists of the last century, Sir John Sinclair, and the brother of Catherine Sinclair (a clever novelist as well as an observant and intelligent *habitué* of the best society), the Archdeacon has had hereditary and collateral opportunities and advantages, of which he has known how to make pleasant and polished use. To his father's interest in agricultural improvements as well as political economy he owed the best of introductions to the United States—namely, sonship to a friend of Washington. To one of the ablest and truest of Napoleon's generals, Marshal Macdonald, his father's name was a passport on another score—the knowledge of his sympathy with the scheme for reviving the Scottish Guard in France. But to his own professional activity, his remarkable *savoir faire*, and indeed to his gleams of that wit which made some of his acquaintances suspect him of Irish rather than Scotch antecedents, he is indebted after all for the larger portion of the experience of men and manners, scenes and places, with which his pleasant book makes us pleasantly acquainted. The first of these qualifications recommended him early in his clerical life to the Rev. Archibald Alison, the author of a once-famous Essay on Taste, and the first of preachers in an Edinburgh episcopal chapel to break through the tradition that places of worship were for the ladies and the old gentlemen who were getting old-womanish. On the second Sunday of Mr. Alison's ministry, as the Archdeacon was told by two of the female part of the auditory, "we all exclaimed, 'we hae gotten another man among us;'"

and the wonder grew till the proportion between the sexes was equalised. A preacher who could win the ear of Lord Jeffrey and of Lockhart found the need of a handsomer chapel and of an assistant minister. From Edinburgh, where he met Walter Scott, Dugald Stewart, Dr. Chalmers, and men of such calibre—where, too, he conversed with men who could tell him of the eminent lights of an elder generation, his appointment as Secretary to the National Society removed him in 1839, and—if it be no treason to the modern Athens to say so—introduced him to a wider field for the tact and talents which want opportunity and a field for their due development. In this office, and in those which his discharge of it earned him—albeit, hardly, as we look back, commensurate with his services—he won the confidence and intimacy of Archbishop Howley, Bishop Blomfield, Lord Shaftesbury, Joshua Watson, and a host of other leading spirits of the day; and in all the pressure of business his note-book would seem to have been hard at hand whenever there was a saying to record, a notability to describe, or a parallel to draw. The re-perusal of such note-books in ripe old age has borne fruit of such kindly and mellow growth as no biliousness can reject, and no purism cry fie upon; and if, now and then, there comes a story we have heard before, or a *mot* which we seem to have known for years, such apparitions are, in truth, quite the exception, and even to a collector of "Ana" the Archdeacon's volume would be an acquisition. Take, for example, the story (which he attributes to his grand-uncle Bosville, an eccentric Londoner of Horne Tooke's date, and which is no whit the worse because its veracity is not guaranteed) of the balletins which announced at the Vatican the various stages of Pope Clement XIV's last illness. From "His Holiness is very ill," they went through what might be called a sliding scale, until "at last, the day before the Pope expired, came forth the startling announcement 'His Infallibility is delirious'" (p. 138). Of Sheridan, through his brother-in-law Ozias Linley, a Fellow of Dulwich College, and himself the "*pars magna*" of some of the best stories of absence of mind we have ever met with, Archdeacon Sinclair quotes some capital repartees, e.g., "I'll stake the profits of my last book on that point," said Monk Lewis, at the close of a warm discussion. "No," answered Sheridan, "I can't afford so much, but I am ready to bet the worth of it" (p. 162). Of Dr. Jephson of Leamington he owes a characteristic *mot* to Dr. Chalmers. Chalmers had remarked upon Jephson's way of enquiring into the previous habits of his patients, so that from the discovery wherein these were wrong, he might be able more exactly to direct them aright. "I observed," writes our author, "that Dr. Jephson was not supposed to be very punctilious in the observance of his own rules." "No," says Dr. Chalmers, "he compares himself to a finger-post, which always points but never moves in the right direction" (p. 80).

Another feature in these sketches of past scenes and the actors in them is the natural way in which Archdeacon Sinclair conveys

by a touch or two the characteristic of the man he is describing, or the impression which he created. Most people have heard wonderful accounts of the forcible oratory of Chalmers, but never that we are aware has so remarkable testimony to its effect been recorded as that of our author, viz.,

"that on one occasion when he was powerfully demonstrating the impossibility of order arising out of Chaos without the agency of an intelligent Creator, I observed that by degrees not merely the front rows but nearly the whole class had risen to their feet ;"

a homage like to that described in Virgil's line, "Utque viro Phœbi chorus adsurrexerit omnis." In like manner he presents us with a lively idea of the readiness of Bishop Wilberforce, in the anecdote of his coming unprepared into Willis's Rooms, amidst a meeting of the National Society where he was advertised to speak, supplicating crumbs of information from the Archdeacon, on whom he fastened ; and anon, when called upon to speak, "expanding the crumbs," as our author puts it, "into substantial loaves." The counter picture of unreadiness was Archbishop Howley, of whom everyone has heard, that if he had to speak of "women," his fastidiousness led him to run through the range of synonyms, periphrases, and all possible and impossible figures—"sisters, weaker sex, female persons"—until he got into an inextricable boggle. Perhaps the best conceivable illustration of the advice, "Do as I say, not as I do," is this Archbishop's counsel to the Archdeacon, whom he really desired to serve. Meeting him at the gate of Kensington Gardens, he warned him, by force of illustrious examples (other than himself), that the secret of failure in oratory was "to be more anxious about words than about ideas" (p. 273). Among the other remarkable men whose friendship he enjoyed, were Lord Chancellor Erskine and Sir William Hamilton, and his reminiscences of the wit and good companionship of the one are as lively as of the vast attainments of the other. Of Sir W. Hamilton he notes in passing, that his unprecedented list of books for the Schools at Oxford included *all Aristotle and all Cicero*, so that he could have drawn some of his examiners out of their depth. The subject of another of his sketches, Archdeacon Williams, of Cardigan, has the credit of having taken up "the Classics," but this (which Mr. Sinclair does not mention) may have been more a flourish than an undertaking of a *bonâ fide* nature. "Homerus" Williams was doubtless a brilliant though eccentric scholar, and had some pretensions to the name which he claimed, of a heaven-born schoolmaster, but it was just as well that his advocacy of Welsh-speaking bishops for the Principality did not lead to a mitre for himself, which his oddities would hardly have allowed him to carry with dignity, though his learning was beyond question, and he had mixed too much in the world to fall into the error of bestowing his patronage on mere vernacular preachers rather than men of education and learning—the error of doing "something for Welshy because Welshy had done so much for him." Our author does not depict the quaint half-bardic appearance of Archdeacon Williams, as, in the days of his principal-

ship of Llandovery College, "his hoary hair streamed like a meteor to the troubled air," yet it was a sight to remember. He does, however, preserve several traits of the man, and a few of the good stories which were his speciality. Here is one of them :—

"I was one day conversing with Dr. Williams about schools and school examinations. He said : 'Let me give you a curious example of an examination at which I was present in Aberdeen. An English clergyman and a Lowland Scotsman visited one of the best parish schools in that city. They were strangers, but the master received them civilly and enquired : "Would you prefer that I should *speer* these boys, or that you should *speer* them yourselves ?" The English clergyman having ascertained that to *speer* meant to question, desired the master to proceed. He did so with great success, and the boys answered numerous interrogatories as to the Exodus from Egypt. The clergyman then said he would be glad in his turn to *speer* the boys, and began : "How did Pharaoh die ?" There was a dead silence. In this dilemma the Lowland gentleman interposed. "I think, sir, the boys are not accustomed to your English accent," and enquired in broad Scotch, "Hoo did Phawraoh dee ?" Again there was a dead silence, till the master said : "I think, gentlemen, you can't *speer* these boys ; I'll show you how." And he proceeded : "Fat cam to Phawraoh at his hinder end ?" i.e. in his latter days. The boys with one voice answered "He was drowned ;" and a smart little fellow added, "Ony lassie could hae told you that." The master then explained that in the Aberdeen dialect "to dee" means to die a natural death, or to die in bed : hence the perplexity of the boys, who knew that Pharaoh's end was very different."—(Pp. 240-41.)

We have not touched upon Archdeacon Sinclair's descriptions of distant places, "The Orkney Isles," "Washington," "Niagara ;" but it may be enough to say that they are so lively, acute, and observant, that it is impossible not to regret their disproportion to the more biographical sketches. Yet even in taking note of distant places the Archdeacon is never so happy as when he can introduce men and *mots*. His glory is in anecdotes. At the outset of the trip to the Orkneys, for instance, we have a Sinclair proverb, "One skipper is enough for a boat," illustrated by the confusion and quarrelling which arose when seven skippers, or captains, were engaged to row and steer Sir John Sinclair across Pentland Firth to canvass the city of Kirkwall. In his visit to Washington he manifestly enjoys the good story of President Pearce's disrelish for having the line of policy he was to pursue suggested to him by the extempore prayers of a non-episcopalian minister, to whose congregation he belonged, and who no doubt sought to improve the occasion of having before him, and at prayers with him, "the ruler of half a continent." The result was to convert him to the principle of Church and State. That part of the book, however, which is pure description, is exceedingly readable, as one of the characteristics of its writer's style is a certain clearness which leaves no doubt of its meaning, and which evinced itself, in another field, in the Archdeacon's message to the Privy Council on the part of the National Society in 1839, "If you will give us full security for the religious education of the people, we will give you full security for their secular instruction" (p. 209).

JAMES DAVIES.

England and Russia in the East. A Series of Papers on the Political and Geographical Condition of Central Asia. By Major-General Sir Henry Rawlinson, K.C.B., F.R.S., President of the Royal Geographical Society, and Member of the Council of India (formerly Envoy and Minister at the Court of Persia). With Map. (London : John Murray, 1875.)

SIR HENRY RAWLINSON'S supererogatory repudiation of any official authority or responsibility in this publication savours too much of an excuse which is self-accusing, and was quite uncalled for. He knows more of Oriental affairs than any man in England ; and it is his personal authority alone which will give any weight with the public to his views, and certainly not the fact that he happens also to be a member of the Council of India. Had Sir Henry Rawlinson even been chargeable with an official indiscretion in republishing under his own name this collection of anonymous contributions to the *Calcutta and Quarterly Reviews*, no one would have had any reason to complain of him ; while the very constitution of the Council of India, as a body of irresponsible advisers of the Secretary of State for India, is sufficient proof, if any were needed, of the purely unofficial character of his book.

To quote Sir Henry Rawlinson's own words :—

"The Council of India has no executive powers. It is a purely consultative body, in which every man has his own opinion, and communicates it, when asked, to the Secretary of State, who is alone responsible for administrative action. In my own case, for instance—as the result of forty years' continuous observation in Central Asia, fortified by a large personal experience in Persia, in Afghanistan, and in India, I have formed a very decided opinion, . . . that in the event of Russia's approach to Herât it will be indispensable to the safety of India that we should resume our military occupation of Western Afghanistan ; but I have no reason whatever for believing that such views are shared by the responsible officers of the Crown, either in India or in England. The arguments in favour of such a course are put forward on my individual responsibility and with a view of eliciting discussion, not of foreshadowing the policy of the Government."

It is in the spirit of true wisdom and patriotism that Sir Henry Rawlinson has deliberately thrown on his countrymen the embarrassing responsibility of accepting or rejecting his well-matured views, as the public discussion of them and the course of events—"the chapter of accidents" which governs everything, and with which Englishmen seldom have cause to quarrel—may determine.

Sir Henry Rawlinson has been decried as an alarmist and the advocate of a policy of jealousy and defiance towards Russia. Nothing could be more false. He views the advance of Russia in Asia in the most impartial and even sympathetic spirit, and with no ill-feeling whatever. He simply shows that it is disturbing the minds of the people of India, and if extended to Merv will become a military as well as political danger to India, as Russia would command from Merv the open road to India—along which a phaeton can be driven—by Herât and Candahar. Everyone understands and acknowledges this, and Sir Henry Rawlin-

son does no more than enforce these patent facts, actual and potential, by an irresistible accumulation of proofs. The policy which he believes we should pursue in the face of these dangers is one of the most natural and spontaneous self-interest, without any personally offensive reference to Russia. He would have neither part nor parcel in the proceedings of Russia in Central Asia (chap. iv. § 9); no convention with her on the basis of the *uti possidetis* (chap. iii. § 11); no "friendly partition of Asia leaving no intermediate zone" (chap. vi. § 7), as has been advocated by an influential portion of the Russian press. He would leave Russia equally with England to work out her own career, frankly acknowledging that while our boundaries in India require very little rectification, having well nigh reached their natural defensive limits, Russia is still a growing power. Only we must beware that her growth does not encroach on or menace our interests in India and Asia. Russia is pledged to the integrity of Persia, and we must keep her to her pledge. Russia is also pledged to keep beyond the Oxus, and if notwithstanding her engagements she either oversteps it, or from the European basis of the Caspian advances to Merv, then Sir Henry Rawlinson believes that we shall be forced to occupy Shaul, Candahar, and Herat, leaving Cabul and Ghazni to Afghanistan. He believes that the Afghans will sooner or later ask us to do so.

"Taking it for granted," he writes (chap. vi. § 7), "that we shall never wait to be attacked, in which case the troubles in our rear would probably be more serious than those in front, the next point to consider is how and where we are to meet the enemy. At what point are we prepared to say to Russia, 'Thus far shalt thou go, and no farther?' Along the northern limits of India and its dependencies Russia has herself drawn a line—the line of the Oxus—which she is bound not to transgress; but this limitation hardly meets the general question, since the road into India from Russia's European base is not from the northward across the Hindú-kush to Cabul, but from the north-westward by Merv, Herat, and Candahar, and upon this line there has been hitherto no understanding as to a finality of advance; nor, perhaps, is it advisable that there should be an understanding which would hamper England, but leave Russia free. Without, therefore, making any offensive notification to Russia about the limitation of her advance, and reserving to ourselves the right, in the interests of the Afghans, to impede her occupation of Merv, if it seem advisable, I submit that we should at any rate make up our own minds that she shall not follow up the Murgháb valley from Merv into the Afghán territory unopposed. In fact, the facility of taking Herat by a *coup de main* from Merv is so patent, while the consequences of that movement to British India might be so fatal, that it seems a fair matter for consideration whether the Russian occupation of the one city should not be immediately followed by the British occupation of the other. Should the crisis be delayed for another year or two—and it seems only a fair surmise that it will be so delayed—the clouds that now obscure the Cabul horizon will in all probability be blown away, and Shír Alí will then be the first to suggest the necessity of holding the 'key of India' with a British garrison."

It must be remembered that in Western Afghanistan we should be among friendly populations, and that Candahar and Herat are respectively no farther from Kurrachee than Delhi and Peshawur. There would be

no difficulty in increasing our army for the purpose, if the army were made a livelihood for men. The East India Company never had any difficulty in getting recruits. The great difficulty, indeed, would be the charge on the revenues of India.

Sir Henry Rawlinson also advocates the establishment of a fortified outwork at Quetta, above the Bolan Pass. By so doing we should settle a lawless State in our immediate neighbourhood, and consolidate our frontier, and occupied in strength too great to admit of being masked, it would in the event of an invasion delay our enemy sufficiently to enable us to mass our full forces in the rear (chap. v. § 8, b). Above all it would have a quieting and immediate effect on the people of India, both those friendly to us and those inimical to our rule. Quetta, indeed, forthwith should be fortified as a "*place d'armes*." The occupation of Herat is, however, altogether a different matter. It would throw a permanent and intolerable charge on the inelastic and already overburdened revenues of India; and after all the strongest military defence of a country is a free and elastic revenue and a light national debt. If India were an independent country, her statesmen without doubt would take the most stringent steps to secure the country against every possibility of danger from the direction of Central Asia; and as the destinies of the country are in our hands, we are bound to be doubly vigilant on her behalf. But our responsibility to keep India solvent is equally great and far more pressing. In short, while keeping ourselves fully informed of the progress of Russia in Central Asia, we must be careful not to exaggerate its dangers to India, or to rush into any unnecessary defensive measures of a financially ruinous nature. Money is the sinew of war, and 50,000 Russians at Merv would be less dangerous to us than taxing India beyond the capability of the country to bear taxation, and the patient endurance of its long-suffering people. It is not likely that Russia will ever become a truly great power. There are unmistakeable signs already of the breaking up of the Empire from internal disorders. She holds her sprawling conquests in Central Asia by the most precarious tenure, and entirely at our discretion. Our greatest danger from Russia is the effect which her barren conquests, which look so large on the map, have had on the minds of the natives of India. But the large and growing class of educated natives are beginning to understand the hollowness and corruption of the Russian power, and that she is quite unequal to meeting us in arms in Central Asia, and will never seriously attempt to do so. They already thoroughly understand also the reality of our own power, and are beginning to show a patriotic appreciation of the justice and righteousness of our rule. They see, too, that our great and growing colonies in Australasia and at the Cape afford us a second base of operations in India. There is also a still larger class in India on whom the material prosperity of the country under our rule is slowly but surely telling. Disaffection and discontent and privy conspiracy exist in India to a great and danger-

ous extent, but time is altogether on our side, and we may leave much to its benignant course. India is the key of Central Asia, and when once the interests of the governors and the governed in India are completely identified, we need fear no hostile elements in Central Asia. All government is difficult, and is becoming increasingly difficult in these days, but the natives of India are the easiest people in the world to govern. Much depends on our own loyalty to them. They like us, but certainly no more than we allow them to do so. They see we have some good points, and value them. But we make ourselves socially very objectionable to them, and have hitherto kept them studiously as a body out of all positions of trust and emolument. All this must be reformed. But they are minor points. The whole question of the stability of India, and with it of our paramount influence in Central Asia, is one emphatically of finance, and until the finances of India permit us to reorganise the Indian army, it is in vain to talk of garrisoning Herat; and it would be madness to attempt it in the present state of the Indian army. But Sir Henry Rawlinson is so decided on the necessity of occupying Herat under certain contingencies that he shall have the last word on this subject—the last paragraph of his book:—

"I will only say one word in conclusion, that I counsel nothing rash or premature. If Russia remained encamped on the Caspian, we should not, of course, leave the valley of the Indus. So long as she held aloof from Merv, we should hold aloof from Herat; but if she deliberately threw down the gauntlet she must expect it to be taken up. We could not, as the guardians of the interests of India, permit her, on the pretext of curbing the Turcomans, or establishing a trade route through Asia, to take up a position unopposed on the Murgháb, which would compromise the safety of Herat. That city is both strategically and politically an indispensable bulwark of India, and we cannot and will not allow its future fate to be at the disposition of a foreign power."

It is more than probable that Sir Henry Rawlinson's outspoken and vigorous words will obviate the necessity of our ever having to incur, or even contemplate, the risk of permanently occupying Herat. His judicious audacity is likely to save us from great embarrassments, sacrifices, and possible dangers. His book will certainly mark an era in our political dealings with Persia and Afghanistan, and the countries of the so-called neutral zone. It will educate public opinion on the Central Asian question, and strengthen the weak hands, and confirm the feeble knees of our diplomatists. It only remains now that we should keep up our knowledge of the subject. We should have our recognised agents everywhere throughout Central Asia. Our mission at Teheran should be reorganised, and a new Minister appointed. A mission should at once be sent to Herat, and a first-class agent stationed at Meshed. And Russia should be kept to the compacts of 1834 and 1838. There must be no more ignorance, no more shrinking from the responsibilities of Empire. The capacity of Englishmen for imperial rule has abated nothing of its natural force, and as a free and self-governed people we must soberly

and steadfastly keep the practice of our national policy to its theory:—

"Meruitque timeri, nil metuens."

GEORGE BIRDWOOD.

Spain. Art Remains and Art Realities, Painters, Priests, and Princes. By H. Willis Baxley, M.D. (London: Longmans & Co., 1875.)

THESE volumes are the result of a nearly three years' residence in Spain by a valetudinarian American physician in search of health. He is a man evidently of strong æsthetic tastes, and of equally strong religious feelings. The whole of what is commendable in the book may be attributed to the cultivation of the first, while a great deal of what is the reverse of commendable springs from an undue indulgence of the second. Not that we have any quarrel with him on the score of his religious principles; quite the contrary. It is our frequent accordance with the matter of these that makes us more deeply regret the manner and the bad taste of their expression. It may seem strange to rush at once into such a subject in a review of a book which professes to be a kind of Art-guide to Spain. But unhappily the subject is forced on the notice of the reviewer, for religious, almost as much as æsthetic, discussion forms the staple of the book. And akin to these disquisitions of second-hand theology are also disquisitions of second-hand history. Thus many wearisome pages in an otherwise interesting description of Granada and of the Alhambra are taken up with discussions of minute points of difference between Prescott and Washington Irving, without any reference to, or apparent knowledge of, the original authorities, either Spanish or Arabic.

Disquisitions and discussions of this kind, longer or shorter, take up at least one-third, if not more, of the two volumes; and we have preferred to speak of them first in order to be able to devote ourselves with greater freedom to the more grateful task of examining what is more meritorious in this work. Indeed if, instead of argument, the writer had given fact, or even simply related the impressions produced on him by the sight of the acts of worship which he condemns, his testimony would have been most valuable. We should have been glad to have the evidence of one who speaks of a gem of art as "a shrine at which he might excusably stand transported to, at least the verge of worship" (vol. i. p. 89), and who is yet so staunch a Protestant, to the actual truth in Spain of Dean Milman's dictum: "In general, the ruder the art, the more intense the superstition. The perfection of the fine arts leads rather to diminish than to promote such superstition. There is more direct idolatry paid to the rough and ill-shapen image, or the flat, unrelieved, or staring picture, than to the noblest ideal statue, or the Holy Family with all the magic of light and shade" (*Latin Christianity*, vol. ii. p. 349). Nowhere could the truth or falsity of this axiom, or of the almost opposite one of Mommsen as regards art—"As colours are effects of light, and at

the same time dim it, so art and science are not merely the creations, but also the destroyers, of faith"—be better studied than in Spain. We are glad to see Dr. Willis Baxley admit and appreciate the exceeding beauty of the wood-carving, and even of some of the polychrome wooden statues of Spain, which are often contemptuously passed by by those who take for granted that every coloured image in wood must be merely a doll. We have seen some whose beauty and others whose intensity of expression have moved us as much as the finest painting, but we have never found these creations of art objects of popular worship or of superstition; nor, as far as we are aware, with but one exception, has any miraculous legend been attached to any really artistic image. But our experience is limited, and we should gladly have had it confirmed or modified by the wider observation of Dr. Baxley.

In one respect we find the title of the book too large—*Spain: Art Remains and Art Realities, Painters, Priests, and Princes*. The book is in many respects an admirable guide to the remains of art and architecture, Roman, Moorish, and Christian, in the large towns of the east and south of Spain (in the west and north even places like Burgos and Leon are greatly hurried over); but though such cities contain the chief, they certainly do not contain the whole of the remains of Spanish art. Even Ford's encyclopædic *Handbook* does not cover the whole ground. In many an out-of-the-way spot, in many a small town or remote half-dilapidated convent, works of art or curiosities of archaeology are to be found well worthy the attention of the student of art or architecture. We especially draw attention to this because through negligence and the destruction of civil war these objects are gradually disappearing or sometimes get removed from the original locality. One of the chief uses of the author's book, even in the towns where catalogues are to be bought and information to be procured, will be found to consist in the statement of the actual locality and present numbering of the works of art which he describes; and if such a thing is necessary in Granada, Seville, and Madrid, much more is it needed in more remote districts where art-critics have scarcely penetrated and where catalogues do not exist. More especially still is this the case with literary treasures. The amount of unpublished MSS. in Spain is enormous, and they are often in private hands or in conventual or municipal establishments. After having been closed for many years, the library at Roncesvalles has now been removed for safety (?) to Pampeluna. The celebrated Castellon inscription has entirely disappeared. Refugee Capuchin monks tell us of convents where MSS. are daily being consumed for vilest uses, or are slowly rotting away through damp and neglect. No one can say what treasures may be lost in these out-of-the-way places; for through her missionaries, especially the Jesuits, MS. wealth in all languages was constantly being sent home to the parent convent in Spain—MSS. which remain there still uncopied and unexamined. For instance, the Prior of Roncesvalles assured us that the library

possessed a copy of the whole works of Confucius in Chinese characters, the gift of a Jesuit missionary. Roman coins are yet in occasional circulation in out-of-the-way places, and mediæval ones are of almost daily occurrence.

Our author entered Spain by the eastern route, and gives an excellent account of the Roman remains of Tarragona, Sagunto, and other towns of that coast, and also of the Gothic cathedrals of the first-named place, and particularly of Sigüenza, with which he was much struck. Thence he passed by Valencia and Malaga to Granada, whose beauties and those of the Alhambra he most carefully examined and highly appreciated. In fact, his enthusiasm for the beauty of Moorish architecture makes him unjust, not only to the art and civilisation, but even to the religion, of the successors of the Moors. A strange sentence to this effect will be found in vol. i. p. 223. Again, in vol. ii. p. 77, he writes of bells replacing the Muezzin's cry: "Here, where once went forth the summons to prayer, vocal with music as with mind, now is heard hourly the clatter, and at times the crash, of twenty bells to tell of the 'sounding brass and tinkling cymbal' of religionism." We have heard the Muezzin's call for months together. It seemed to us like most other intoning. Once in about twenty times it is well done, and is most effective; the other nineteen times it is a nasal quaver, drawl, or whine. On the whole, we prefer the bells. Dr. Baxley succeeds, however, in imparting to his readers some of his own enthusiasm of delight in the architectural beauties of the Alhambra, and would do so still more but for the insertion of the tedious discussions on Prescott and Washington Irving alluded to above. He does not seem to have noticed, however, that in their "cellulo-pendulous," or "honeycombed stalactite ceilings," the Arabs are the only people who have reconciled ornament with an almost perfect system of ventilation. Nor does he remark the influence which that marvellous harmony of colours in combination—the especial gift of Orientals—had for a moment on the colouring of the stained windows of mediæval art. Like the Arabic mosaics and mural colouring, some of these ancient stained windows, in spite of their brilliance, are a repose and relief to the eye wearied with the glare of outdoor sunlight. But unhappily the secret of this harmony and repose in the combination of colour was soon lost, and is now replaced by the painful predominance of whatever may be the favourite hues of the artist or the manufacturer. In the same way the peculiar richness and exuberance of detail in Spanish Gothic architecture may be traced to the influence of the subtle and infinite variety of the tracings of Moorish arabesque; though in this case it may be a question whether this influence has been altogether beneficial in hiding and overloading the simpler and severer outlines of the Gothic style.

No part of the book will be read with greater pleasure than the criticisms and descriptions of the pictures of Murillo and the other masters of the Spanish school; though this pleasure is somewhat marred by the polemical tone adopted against Velasquez,

Rubens, and others, both critics and painters. We quite agree with our author that it was an advantage, and not a loss, to art that Murillo was unable to visit Italy, and that his genius developed itself in almost complete independence of the influence of the Italian school. Gazing on Murillo's masterpieces, we think, had the blessed Virgin Mary been a Spanish maiden, thus she might have looked; but the ideal and semi-classical beauty of the Madonnas of the Italian school seems hardly of the earth at all. Perhaps a truer type of the Virgin mother is yet to be found when artists grow familiar with the girl-matrons of the East, where the grace and seeming innocence of childhood yet linger round the wondering young mothers.

Another point for which we must commend our author is the honesty and fairness with which he speaks about climate. Nothing is more rare than to get, especially from a medical man, an impartial statement on this subject. Prejudice either for or against some particular locality almost always biases the judgment. We fully agree with the author that the possibility or the reverse of procuring in-door comforts should be greatly considered in the choice of any winter station in Europe. No spot outside the tropics is free from occasional damp and cold, and either of these confines the invalid within doors, and where the house is cheerless, and artificial warmth unattainable, most deplorable results may ensue. Still, we think he hardly does justice to the marvellous curative influence of climate in cases where disease is not too far developed, even in spite of all these discomforts and non-sanitary drawbacks; and we speak from no inconsiderable observation.

The remarks scattered through these volumes on the political and social condition of Spain are of singularly little value. Apparently the author did not mix at all in Spanish society, and he has formed his opinions from the information of foreign residents and of visitors like himself. So, too, forming his opinions from Spanish art, the author has missed the gaiety and fun and caustic wit which is a frequent characteristic of Spanish character of the lower classes. It has often been remarked that the Spanish rogue is the only amusing rogue in Europe. In spite of the Inquisitional and ecclesiastical tyranny which weighed so heavily on the work of the great painters, the religious and Christian folk-lore of the Spanish people is characterised by an exuberance of tender playful fancy, such as we find in no other people. For proof of this we refer to the numberless scraps of legends, carols, ballads, and nursery rhymes which have gathered round the Nativity and the Crucifixion in the popular traditions. As to darker traits of the Spanish character we must remind our author that two wrongs do not make one right. He is especially fond of girding at what he imagines to be the faults of the British aristocracy and traders, to excuse the Spaniards. But if fox and hare hunting be cruel, that fact would not make bull-fights less so. If money marriages are undesirable, that fact does not make a breach of the marriage bond less excusable. Too eager a pursuit of wealth

in one country does not form a valid excuse for idleness, and wanton neglect or waste of nature's bounties in another.

WENTWORTH WEBSTER.

THE REGICIDES.

Briefe Engländer Flüchtlinge in der Schweiz.

Aus einer Handschrift der Berner Staats-Archivs herausgegeben und erläutert von Alfred Stern, a. Professor der Geschichte a.d. Universität Bern. (Göttingen: Robert Peppmüller, 1874.)

THE letters from English Republican refugees published in this pamphlet range from 1663 to 1671, and comprise two of Cawley's (who took the name of Johnson), one of Lisle's, three of Ludlow's (writing under the name of Philipps), and four of "John Ralfeson," whom Professor Stern is disposed to identify with Nicholas Love. To these are added two letters (1668) on the absence of the refugees from the celebration of the Communion, and a number of extracts (1662-65) from the Archives of Bern and Lausanne relating to the refugees, and more particularly to that "Monsieur Du Pré" (or, as it is generally spelt in these extracts, Desprez) who is often mentioned in Ludlow's *Memoirs* as engaged in the plots against them. The pamphlet is chiefly valuable as illustrative of the third volume of Ludlow's *Memoirs*. His letters are distinguished from those of his fellow-refugees by their strongly marked political character, and show that he must have been in constant correspondence with England. The two letters on the absence of the refugees from communion are curious. The fact of such absence, it seems, had been remarked, and two persons, both apparently ministers, had been called on by the "bailif" of Vevay to report upon it. From their letters it appears that the Puritanism of the exiles was offended at the too lax admission of communicants in the Swiss churches, but Ludlow only claimed to be dealt with on the footing of the text, "He that is not against us is for us." The refugees are recognised as persons "qui mènent une vie irréprochable."

Professor Stern mentions with some surprise that no copy of the first edition of Ludlow's *Memoirs*, dedicated, as is well known, "to their excellencies the Lords of the Council for the Canton of Bern," is to be found in Bern itself, but only one of the folio edition of 1751, a presentation copy, richly bound, and which, according to a letter which has since been addressed to the editor of the ACADEMY by Professor Stern, appears to have been forwarded by Thomas Hollis to the Town Library. On this it may be remarked that the imprint "Vevay" of the first edition of the *Memoirs* is probably a fictitious one, the type and general get-up of the volumes being altogether English. As respects the third volume, at all events, a tract of 1700, "Regicides no saints nor martyrs, freely expostulated with the publishers of Ludlow's third volume," says of this imprint, "Had they said at Derby it had been nigher home, and nigher truth too."

Professor Stern's introduction and notes

are careful and instructive, and contain references to entries in the Calendar of State Papers, which will probably be new to many readers, corroborative of Ludlow's statements as to the complicity of the English Court in the attempts against the refugees, such as the two letters, or rather reports, in French, the one endorsed "Major Riorden's paper, received December 29, '63," and referring to previous letters, "écrites à monseigneur le comte," and the other endorsed "Pontarby proche Neufchasteau 8 Aug. 64, Mr. Riordan," and directed, "For the most right honorable Sir Henry Benet, Knight, Principal Secretary of State, and unto the privi conseil of his most excellent Maestie of Great Britanny," letters which, however, from the idiomatic if not orthographic French in which they are written I should feel inclined to attribute rather to Du Pré or Desprez than to the very likely illiterate Irishman MacCarty, who took the name of Riordan. But indeed such complicity could never have been doubted except by those who will believe against all evidence, since by the favour shown to Lisle's murderers—the author of *Regicides no Saints nor Martyrs* admits that "somewhat was done for them, mostly in military commands during the Dutch war, and afterwards as occasion serv'd"—the English Court virtually took up the position of an accomplice after the fact.

J. M. LUDLOW.

NEW NOVELS.

Elsie, a Lowland Sketch. By A. C. M. (London: Macmillan & Co., 1875.)

The Village Coquette. Translated from the German of Friedrich Spielhagen, by J. L. Land. (London: Chapman & Hall, 1875.)

Profit and Loss. By Mrs. E. R. Pitman. (London: James Clarke & Co., 1875.)

Dolores. By Mrs. Forrester. (London: Hurst & Blackett, 1875.)

Two Kisses. By Hawley Smart. (London: R. Bentley & Son, 1875.)

Restless Human Hearts. By Richard Jeffries. (London: Tinsley Brothers, 1875.)

Elsie, a Lowland Sketch, is an attempt by a new aspirant to achieve a very difficult task, that of producing a novel variation on the trite theme of the betrayal, through a false marriage, of a peasant girl by a lover of a higher social grade. At first it does not appear that success will be attained, for the writer does not exhibit much descriptive power. The story is rightly called "a Lowland sketch," in so far that it is localised near the English border; but there are no such graphic details of scenery or accurately marked peculiarities of dialect as meet us in the *Harbour Bar*, and some other recent Scottish novels. Border Scotch is quite distinct from the Scotch of Lanark or Edinburgh, much more from that of Aberdeen; but in this story there are only a few conventional phrases introduced here and there to give local colour. Nor are the characters forcibly drawn. The heroine, gentle and sweet, is yet little more than a shadow; John Elliott, her stern father, is but a very faint transcription of Scott's David Deans; and the lover is a mere conventional Epicu-

rean. All this marks immaturity; and the earlier part of the volume is by no means striking. But there is a steady improvement throughout; the author displays increased grasp of her subject, and gradually rises into a tone of subdued yet sustained pathos, which never degenerates into mere sentiment. The incident of the invalid marriage is given a novel and yet perfectly consistent and possible treatment; and the story of the home-coming of the wanderer is told with a tender grace which fully redeems any weakness at the beginning. The hand which drew this sketch is capable of bolder composition and more vivid colouring, if only it will be diligent and conscientious in future work.

"The Village Coquette" is a subject which would have just suited Victor Hugo, who would have elaborated it with a fantastic vigour very far removed from the somewhat tame style of the German author, who has devised a very striking situation, with some telling effects, but has not known how to work them out to the best results of which they are capable. Only the bare outline of the story is given, in about the same compass as one of Poe's tales, and there is considerable faculty and conception displayed in it; but the opportunity of giving it some dramatic form has been thrown away by the device of putting it all into the mouth of one narrator, instead of bringing the characters themselves in person on the scene. If Herr Spielhagen would work with a partner, after the fashion of MM. Erckmann-Chatrian, and find the plots, leaving their evolution to his colleague, we might look for some tales which would live.

Profit and Loss belongs to a class of literature whose very existence is almost unsuspected by the great mass of cultivated persons. It is a story reprinted from the *feuilleton* of a syncretist religious newspaper called the *Christian World*, which has a large circulation amongst the lower middle class of Nonconformists, and supplies in this fashion the craving for fiction and amusement keenly felt in hundreds of families whence a novel, appearing avowedly under that name, would be rigidly excluded. This literature is a thing as much apart and peculiar to a class as the "penny awfuls" which the London street boy devours greedily; but it is of a very different character, and honestly aims at providing material for reading which shall not be merely harmless, but in the eyes of its producers instructive and salutary in the highest degree. Some few of these tales, notably such as are written by a lady named Worboise, have a good deal of literary merit of a certain kind, and bear some resemblance to the school of which Miss Yonge is the most prominent example. But it is not possible to say much in favour of *Profit and Loss*. We do not, for obvious reasons, touch on its directly religious teaching; but we may fairly enough condemn its English, which is very far indeed from good, or even tolerable; its overstrained and sensational tone; and that part of its morality which consists in depicting all rich people as being from the mere fact of their wealth the embittered enemies of piety in any shape. The main seat of the story is Bristol, the time that of West Indian

emancipation forty years ago; and yet Mrs. Pitman is so little acquainted with the history of the movement she professes to chronicle, that she forgets that her wicked merchant could not have carried on the trade in negroes after 1807; while the measure of emancipation was carried out mainly through the influence of the little knot known as the "Clapham Sect," nearly all whose members were wealthy, and some of them great financiers. Wilberforce, Gisborne, Thornton, and Shore may surely be set off as realities against Mrs. Pitman's unreal Anthony Montague and Julius March.

Dolores derives all its interest from its heroine, who is imagined with a good deal of freshness and vigour as a child who would never reach maturity of mind, but also with a child's wild passionate longings, acute but short-lived sorrows, and above all, a child's desire for personal ease and comfort. The young lady, in perfect innocence, but with an unconscious eye to her own convenience throughout, manages to engage herself to three gentlemen successively, and to end by marrying the richest and most highly-placed of the three at the end. Mrs. Forrester's real skill consists not in putting forward such a trite notion as this with the pretext that it is new, but in making her readers acquit Dolores of mercenary motives all along, while yet indicating subtly enough that an unavowed love of all that makes life easy and luxurious prompts each choice that the young lady decides on, while seeming to herself to be swayed by entirely different motives. The author is less successful in striving to represent the club-talk of men, and to give her readers glimpses into Bohemia. The true Czech accent is unmistakable to accustomed ears, and it does not echo in her pages.

On the other hand, Mr. Hawley Smart, in his novel, *Two Kisses*, is a great deal more life-like in reproducing the conversation of men with one another, and his heroines are much less conventional lay-figures than Mrs. Forrester's heroes. But he is not nearly so careful a writer, and his style is slipshod to the last degree. Further, not content with the traditional errors of punctuation which printers have pretty well agreed among themselves to keep up for the exasperation of authors and the bewilderment of readers, he has invented a further device of his own, which entitles *Two Kisses* to rank after Daniel's *Rural Sports* and *Martin Chuzzlewit* as the worst punctuated book in the English language. Someone has told him that sentences ought to be short, and the way he has hit on to attain this end is not by writing them short, but by clapping in a full stop every here and there, and beginning the next member of the paragraph, albeit unintelligible by itself, with a capital letter as a fresh start. The book swarms with misprints besides, or, at all events, with mistakes which it is charitable to ascribe to the "chapel;" but we think Mr. Smart must undertake the responsibility of such words as "mysogonist" and "cisebo." If there were such a vocable as the former, it would probably mean a "begetter of defilement," but we give up the latter. As regards the story of the book, which is shadowed out in the title, it belongs to the

class of incident out of which vaudevilles and farces are usually constructed. A newly-married husband and wife become convinced of each other's unfaithfulness by hearing in the one case, and seeing in the other, that a kiss has been given each by a supposed lover, and the clearing up of the estrangement thus caused makes the ending of the tale. But this is a mere peg on which to hang a novel of society belonging to the type of which Major Whyte Melville's *Digby Grand* is perhaps the best known example, and a very fairly readable one of its kind.

Restless Human Hearts propounds an opinion in its first chapter in the following terms:—

"What an enormous amount of verbiage, then, must there be in a book of a thousand pages! Say that it took one hundred pages to give a fair description of the one original thought which prompted the author to commence, then there remain nine hundred pages, of thirty lines a page, and seven words a line, giving a total of one hundred and eighty-nine thousand waste words."

Restless Human Hearts consists of nine hundred and eight pages, and if we must thus deduct ninety-two from the ideal sum of one thousand, yet we may take an equal number from the other ideal of one hundred, so that the ultimate quotient of trash is very much what Mr. Jefferies indicates. We leave him to work out the sum at his leisure, merely observing that there are only twenty-five lines in each of his pages, so that he is entitled to any mitigation of judgment based on the reduction in quantity.

R. F. LITLEDAL.

CURRENT LITERATURE.

Mountain Warfare, illustrated by the Campaign of 1799 in Switzerland. By Major-General Shadwell, C.B. (H. S. King & Co.) This is just one of those books of which it is impossible to speak without respect for the author's purpose, though it is not so possible to predict that he will succeed in it. It is true, indeed, that there is no scientific account to be found in English of the greatest of modern mountain campaigns. But, as the Archduke Charles's narrative in its French dress, and that of Jomini, must be at the service of the military students chiefly addressed (who, indeed, as the author says, will readily recognise many passages from their works), so it can hardly be hoped that the subject will be found by them to be clothed with any great charm of novelty. And, on the other hand, those "lovers of Switzerland and its mountains, apart from military men," to whom General Shadwell partly dedicates what he believes to be a narrative "concise, yet critical," will, we fear, hardly allow the strict justice of that description of the substantial octavo volume of some 300 pages that is before us, or take it in their knapsacks when they do the Furca on foot. Nevertheless, when these drawbacks have been mentioned, it is but the barest justice to say that General Shadwell has accomplished his self-imposed task in a thoroughly conscientious spirit. He has determined to tell his countrymen the complete story of the extraordinary struggle in which were concerned leaders so famous as the Archduke Charles, Suwarow, Soult, Masséna, Lecourbe (the greatest commander in mountain operations of the last century), with a host of such minor generals as the rough Republican Humbert, who had given our own militia their Castlebar defeat very shortly before he was heard of near Zürich, and Hotze, the only Austrian commander under the Archduke who showed any original talent: and he certainly sets to work in

the proper manner. He has found in that valuable old military periodical, *La Revue Suisse Militaire*, by far the best account yet written of the campaign, it being in fact based on the two excellent histories already mentioned, but compared also carefully with the memoirs of Soult and Masséna, and worked into an harmonious narrative with the aid of the practical military judgment and local knowledge of General Dufour, the chief soldier Switzerland has produced during the long peace she has enjoyed since the First Empire vanished. It is, moreover, admirably illustrated by the necessary maps, and rendered in good plain English, such as the lay reader may find more to his taste than a more technically constructed work would be. Beyond the preface, the teaching involved must be got at chiefly in the comments left, by General Dufour apparently, in the course of his narrative. In particular, the lesson expressed by the author at the beginning, in Lecourbe's own words, "It is in the valleys that the mountains must be defended; though this reflection will surprise those who have never made war in mountains," is perfectly illustrated at many points by the story of that general's marvellous exploits, and of the faults committed by his adversaries. Lecourbe, however, seems to have worked at this problem for himself by his own experience. At the commencement of the contest it is clear that neither side recognised the proper principles. Indeed, the Austrians almost throughout acted on the erroneous plan of trying to cover long chains of heights by watching every passage; while of French strategy, as first designed, Napoleon himself has said: "The campaign was planned at Paris by men who had no real knowledge of war. Mountains depend on the plains, and have no more influence in commanding the plains than the position they afford for guns." How Lecourbe discovered for himself a sounder mode of action, and the extraordinary successes he reaped over equal or superior forces by its means, may be read with profit in General Shadwell's version; though the non-professional reader may possibly be more interested by that part of his volume which treats of the romantic but rather over-rated achievement of Suwarow in carrying his rude Muscovites out of the Italian plains across the Alps, in the vain attempt to join their Austrian allies, who had been forced off from their posts without being able to await his promised succour. A very interesting anonymous account of this strange military adventure, by one of the Russian staff concerned, is added; and, with the Swiss commentary on it, will give the student a perfect view of the whole subject. Finally, the volume is, if not completed in the strictest sense (since the special subject of the 1799 operations is properly a distinct one), still enriched by the addition of a translation of an account of the famous "Campaign of the Duc de Rohan in the Valtelline in 1635," from the pen of General Dufour, which is not merely a memoir interesting in itself, but the more so here, as proving that a century and a half before Lecourbe's exploits another Frenchman of ability put into practice, in the same country, with like success, the same principles of acting boldly and with concentrated forces, which, indeed, are true for all time as far as mountain warfare is concerned. With the author we would hope that the many British officers who have before them the possibility of some day sharing in a struggle for the mountain ranges that guard our Indian frontier, may make themselves acquainted with the theory of this part of their craft as illustrated by Lecourbe, and taught in this volume.

Minor Tactics. By Captain C. Clery, Professor of Tactics, Royal Military College, Sandhurst. (H. S. King & Co.) The object of this handbook is sufficiently explained by the motto on the title-page, taken from the words of Sir Charles Napier. That great general and acute observer, in regretting that young men on joining their regiments have "all the temptations in the world to pleasure, none to study," adds the significant

warning: "They may some day find themselves compromised on service from want of knowledge, not of talent"—a true saying no doubt, at any rate as applied to those of his own arm in his own time. There have been great changes since then, however. The system of competitive examination—from which not many years since everything was hoped, as much is now feared—has been of late applied even to those modest entrance commissions into the line which were formerly left to be distributed at the pleasure of a Military Secretary. And after competition, according to the existing system—we state this with diffidence, for our military authorities make such frequent changes that it is hardly safe to speak of any system as having a present existence—they, or at least many of them, are duly entered at Sandhurst as sub-lieutenants to undergo a course of theoretical instruction in military subjects before being transferred to their various regiments. The plan is but experimental, a fact which must make it all the more difficult to lay out a thorough course of instruction, and the more creditable, therefore, to a professor who, like Captain Clery, has applied himself with diligence to bring into his college course of lectures not merely the whole theory of the subject confided to his teaching, but varied practical examples to illustrate that theory at every point. For such a course of lectures has formed the substantial octavo before us. Its chapters appear to have been delivered in the way of actual instruction to the young officers at the College; and they are now published avowedly for the benefit of others who miss the advantage of the teaching there given. There is much well-chosen reading in them for all military students, and indeed for all amateurs of military art; for the dry bones of theory, which of necessity form the groundwork of each, are well clothed by the instances already referred to as carefully brought together by way of illustration. Even that more difficult personage to reach, the general reader, may possibly be interested at finding how history repeats itself in the minutest incidents of war, as in great political events. Thus, to take one of many sets of examples, Captain Clery reminds us that the sacrifice of General Bredow's cavalry brigade at Mars-la-Tour, and later in the day that of the 1st Dragoons of the Prussian Guard, to save the 3rd and 10th Corps respectively from French attacks which the infantry were unable to meet, find their counterpart in Napoleon's desperate use of Bessières' horsemen on that bloody day of Essling (so Captain Clery calls it with the French, the victors Aspern) sixty years before, when the fine strategy of the Archduke Charles inflicted on Napoleon his first defeat. Of such affairs the author well remarks, as a general conclusion from these and various other examples—

"In all these engagements the attacking cavalry suffered great loss, and their success only amounted to checking the enemy, and never to seriously disorganising the infantry opposed to them. But all attempts to replace infantry by cavalry must have similar results, as the true use of the latter is as an auxiliary, and not as a substitute for the former."

We have quoted this summary not only as a fair specimen of the author's reasoning, but because it will show the reader that he has decided convictions of his own to offer. The Prussians notoriously are still rather divided on this very point. But we believe that Captain Clery speaks with perfect truth on it; and we are only surprised that he does not fortify his opinion by a reference to the well-known fact that improvements in firearms, and especially the general use of the breech-loader, seem to have finally determined any supposed equality entirely against the more brilliant but less powerful arm. This is not however, it must be plainly said, the only part of the work where the author, despite much display of painstaking industry, comes short of realising the full practical weight of the lessons of the late war. We doubt whether his artillery examples, drawn from the battles of Frederick and Napoleon, can

have much serious teaching for the modern student of the tactics of that arm. In fact, the whole book, though tolerably readable and full of instructive matter, appears to us to fail in its special object, and would form rather a useful work of reference on detailed points in military history, than a practical guide for instruction in tactics, viewing the subject as one apart from the history of the different arms concerned. With this exception as to its general purpose we may fairly commend it as a conscientious if not brilliant work.

In the reprints of "A Song of Italy" and of the "Ode on the Proclamation of the French Republic," which form the bulk of Mr. Swinburne's recently issued *Songs of Two Nations* (Chatto & Windus), we have not detected any material alterations. Of the merit of these poems this is not the time to speak, else much were to be said, especially of the rhythmical structure of the "Song of Italy." Certainly Italomania and eleutheromania have never yet had the godsend of such musical utterance, and in the opportunity of separating the manner of deliverance from the matter delivered, one enjoys a real critical luxury. Whether these remarks extend to the sonnets entitled "Dirae," which complete the volume, is a more doubtful question, and Mr. Swinburne himself seems to have recognised this by appending an "Apologia" to prove that he does well to be angry. For ourselves, we boast the possession of a quite infinite tolerance for any sentiments whatsoever, if they be poetically expressed. But we cannot help remembering that, even in the good old days when it was thought comely and decorous to grub up the corpses of political foes for the benefit of the gibbet and the dunghill, the execution of this savoury office was usually left to the hangman, and was not undertaken by great poets. Mr. Swinburne has himself very happily and justly censured a contemporary poet for playing the Athanasius of democracy; is it not a pity that he should take up the companion-role of its Ernulphus? Yet after all it is hard to quarrel with any motive which gives us such verses as these (the introduction to this volume):—

"I saw the double-featured statue stand
Of Memnon or of Janus, half with night
Veiled and fast-bound with iron; half with light
Crowned, holding all men's future in his hand.
"And all the old westward face of time grown grey
Was writ with cursing and inscribed for death,
But on the face that met the morning's breath
Fear died of hope as darkness dies of day."

Fairy Tales, Legends, and Romances illustrating Shakespeare and other Early English Writers. To which are prefixed two preliminary Dissertations (1) on Pigmies; (2) on Fairies. By Joseph Ritson. (F. and W. Kerslake.) We are very glad to have a reprint of Ritson's *Fairy Tales*, a very scarce book, and one which contains what was, at the period of its publication, a singularly valuable amount of information; and we are grateful to Mr. W. C. Hazlitt for having, to all appearance, reprinted it exactly as he found it, without adding any remarks of his own. We are the more thankful for this mercy because he states in his preface that "the present republication forms a union of the two [works of Ritson and Halliwell] with certain additions and corrections." The work by Mr. Halliwell incorporated into the present volume is his *Illustrations of the Fairy Mythology of a Midsummer Night's Dream*, published some thirty years ago by a learned society, and therefore inaccessible to most readers. It also we are glad to have in a handy shape, though the price of the volume (12s.) seems high for a mere reprint. Of what science has done, since Ritson's and Halliwell's books first appeared, to elucidate the subjects with which they deal Mr. Hazlitt takes absolutely no notice.

Nursery Rhymes and Nursery Tales of England. Collected by James Orchard Halliwell. (F. Warne and Co.) Mr. Halliwell's collections of Nursery

Rhymes and Nursery Tales are too well known to require any special comment on their joint appearance in the reprint now before us. It will be welcomed by many students who have found a difficulty in procuring the previous editions. It has two grave faults, being published without a date of imprint and without the presence of an index, except an "Index of First Lines to Nursery Rhymes." As to the results of modern research, they are never once mentioned from the title-page to the closing line. But the stories and songs are in themselves of high value, and may be profitably studied without reference to the old-fashioned comments by which they are attended.

AGRICULTURISTS will feel bitterly disappointed when they discover that the new edition of Morton's *Cyclopedia of Agriculture* is only a cheaper reprint of the old edition, issued originally a quarter of a century ago. The last twenty-five years have worked such changes in our agricultural system that the book is now quite out of date and useless. The opening essay by Mr. Wren-Hoskyns gives a curious picture of the farming of a quarter of a century ago, and is well worth reading.

THE *Annual Register* for 1874 (Rivingtons), which has lately reached us, is in no respect inferior to its predecessors in the care and accuracy employed upon its compilation. The nature of its contents is too well known to require further notice here, so we need only recommend the volume as a work of reference the value of which increases every year after its issue. EDITOR.

NOTES AND NEWS.

It is well known that Lord Braybrooke's edition of Pepys's Diary does not contain anything like a complete transcript of the original MS. in Magdalene College, Cambridge, although large additions were made to the different issues. Pepys's numerous admirers will therefore be glad to learn that they may expect soon to have in their hands a complete edition of the Diary. Mr. Mynors Bright, the Bursar of the college, has been engaged for about eight years in deciphering the MS., and having completed his work he is now about to publish it. We have examined one of the volumes, and find that there is about one-third of additional matter not printed in the last edition, and much of this is of more interest than what is printed. Moreover, in this one volume about 140 errors have been corrected in the printed text, and many of these are glaring mistakes, the correction of which is of importance to the sense of the passages in which they occur. We understand that this new edition is very shortly to be issued by Messrs. Bickers and Son in a handsome library form, with numerous portraits. Probably several of the entries will have to be left out as too indecent for publication, but we hope that in all cases stars will be introduced to show where any passage has been omitted.

DR. HÜBNER, of Berlin, who has so ably edited the *Roman Inscriptions of Britain*, a work reviewed some time ago in the ACADEMY by Mr. Wordsworth, is to publish shortly the *Post-Roman Inscriptions of Wales and Cornwall*. He is to be assisted by Mr. Rhys, who has made them a special study, and personally examined nearly all of them.

MESSRS. LONGMANS announce for publication in April Dr. Forbes's *Two Years in Fiji*, Watts's *Snoddan*, Malletson's *The Native States of India*, D'Aubigné's *Reformation in the Time of Calvin*, Vol. VI., and Irving's *Short Manual of Heat*. The new volume of Mill's *Dissertations* will appear in May.

MR. RUSKIN has just published the first part of "*Mornings in Florence*: being simple studies of Christian Art for English travellers," on Santa Croce; and the first part of "*Proserpina*: Studies of Wayside Flowers, while the air was yet pure

among the Alps, and in the Scotland and England which my father knew." The title-page of the latter bears the appropriate motto—

"Oh—Proserpina!
For the flowers now, which, frightened, thou let'st fall
From Dis's waggon."

MR. WILLIAM MORRIS and Mr. Eiríkr Magnússon have a volume of translations from the Icelandic in the press, comprising, among other things, versions of the *Gunnlaugs Saga Ormsvengu*, the *Frithjófssaga*, and the very curious *Hróa þáttur heimskra* or Story of Hróa the Fool. A new volume of poems may also be expected before very long from Mr. Morris.

MR. FLEAY writes to us to point out that the theory with regard to Shakspeare's Sonnets propounded by Dr. Goedke, and noticed by us in our issue of March 27, is almost identical with that published by Mr. Samuel Neil in 1861. Yet the later critic has not so much as mentioned his predecessor.

THE great majority of the papers in Dr. Russell and Mr. Prendergast's *Calendar of State Papers relating to Ireland, James I., 1608-1610*, published this week, are concerned with the province of Ulster. The transactions which followed the flight of the Earls of Tyrone and Tyrconnell; the new relations of the native population of the northern counties to the Crown of England involved in that momentous event; the consequent resolve of the Government to take advantage of the occasion for the purpose of effecting a new settlement of the province; the legal procedures instituted with this view; and the preparatory enquiries, investigations of tenure and title, measurements, surveys, and other preliminaries of the settlement—may all be studied in the very full abstracts given in this volume of the original records of those memorable years. These records are more than ordinarily complete, and exhibit fewer notable deficiencies than those of the previous years of the reign of James I. The artful precautions adopted for the transmission of secret intelligence from Rome to Robert Cecil, Earl of Salisbury, regarding the proceedings of Tyrone, are very curiously illustrated. Among other documents of such a nature calendared is one entitled "Advertisements from Rome," the main subject of which is an account of the ceremonial of a canonisation there, written with all the enthusiasm of a devout Catholic, conveying news regarding the various religious orders, enclosing a packet of "Agnus Dei," and apologising for not forwarding a greater number, and sending the commendation of Father Parsons. And yet this letter, with all its parade of Catholic piety and all its details of Catholic gossip, is but a skilfully devised report of Salisbury's agent, giving incidentally an account of the doings of Tyrone and his friends at Rome. Salisbury's own endorsement of the letter describes it as "written with some clauses to disguise the affection of the intelligencer."

AMONG the autographs disposed of during a three days' sale, terminating on the 2nd inst., by Messrs. Sotheby, Wilkinson and Hodge, were two portfolios containing specimens of 120 distinguished characters connected with the United States, which realised 31l. Two pages from a note-book of Lord Chancellor Bacon, headed

"Elegancies. Miscellany, Apr. 22, 1605,

'All art, not hart,

'After separation reparation,"

sold for sixteen shillings. A letter of Richard Baxter referring to a controversy with Lawson, subscribed "You're very darke and weake fellow servant," sold for 10l. 10s. A letter of Calvin, in Latin, fetched 7l., while one of his successor in Geneva, Theodore Beza, fetched 3l. 14s. A written refusal of an invitation to dinner by John Brahman, the great vocalist and composer, was bought for 1l. 6s.—a friendly invitation from the author of *Religio Medici*, 2l. An interesting letter from Bishop Burnet to Dr. Fall, Precentor

of York, dated April 21, 1698, wherein he says that the Pretender's Court "is now as much despised, and as openly, as you and I knew it admired, but there is a spirit of open impiety and unnatural lust raging there without any reserve," 2l. 4s. Two letters of Robert Burns, 5l.; Caroline, Queen of Naples, to Lord Nelson, referring to the loss of her sister Marie Antoinette, 1l. 14s.; Isaac Casaubon, dated March, 1608, 13s.; Charles Cats, the Dutch theologian, written from London June 25, 1650, alluding to the return of Cromwell from Ireland, &c., 2l.; Charles I. to Prince Rupert, dated Ruperry, July 26, 1645, 7l.; several letters of Charles II., from 1l. 11s. to 2l. 6s. each; Christina Queen of Sweden, "A mon Cousin Monsieur le Duc de Crequy," from Rome, Nov. 10, 1652, 1l. 13s.; two letters of S. T. Coleridge, 1l. 6s. and 1l. 1s.; George Crabbe, 2l. 10s.; a scientific letter of René Descartes, dated Utrecht, April 1635, 3l. 10s.; Dr. Philip Doddridge, 15s.; Lords Eldon and Elgin, 1l. each; two Privy Council Orders signed by Elizabeth, Howard Earl of Nottingham, Lord Chancellor Egerton, Lord Buckhurst, Robert Dudley, and others, 2l. 18s.; Flaxman, the sculptor, to Dawson Turner, November, 1824, 2l. 2s.; a characteristic letter from Sam. Foote to Garrick, August, 1760, wherein he says, "My dear Sir, You and I are a couple of Buckets, whilst you are raising the reputation of Shakspeare, I am endeavouring to sink it, and for this purpose, I shall give next Monday the Tragedy of Hamlet," asking the loan of the Ghost's armour, 5l.; a letter of Garrick to George Colman, 3l. 8s.; another specimen, 1l. 7s.; a long letter of the Poet Gray to Brown, President of Pembroke Hall, Cambridge, in October 1761, in which he gives a list of his furniture, papers, etc., forwarded to the college, and adds, "We are all much out of countenance about this pension, I dare not see Delaval any more, and expect to hear Mason has taken laudanum, 5l."

AT the annual public sitting of the French Association for the encouragement of Greek studies, the ordinary prize was divided between M. Sathas for his publication of the text of Michael Psellus' *Byzantine History*, and M. Petit de Julleville, author of a *History of Greece under the Roman Domination*. The Zographos prize was likewise divided between M. Miliarakis, for his book on the Cyclades, and M. Margaritis for his works on the history of Macedonia.

SEVERAL interesting papers were read at the late annual meeting in Paris of delegates of the learned societies. M. Capmas, of Dijon, announced that he had discovered at a sale of old furniture in a remote part of Burgundy, a MS. containing a complete copy of the Letters of M^{de}. de Sévigné, of which the Gros-Bois MS. used by M^{me}. Régnier and Monmerqué seems to be only a very imperfect reproduction. This discovery will, it is believed, necessitate a new edition of the Letters. M. Combes, of Bordeaux, read a study on two unpublished letters of our Queen Elizabeth to Henry IV. of France, in which the Queen endeavours to dissuade the King of Navarre from embracing the Catholic faith; and M. Baguenault announced the discovery in the Orleans library, of a MS. containing the despatches of Mazarin to the Marquis de Fontenay, French Ambassador at Naples in 1647-8. These despatches, which will be edited by M^{me}. Loiseleur and Baguenault, throw new light on the policy of Mazarin with regard to the expedition of the Duc de Guise against Naples.

AMONG the books to be published in Paris in the course of the present month are the fifth volume of M. P. Lanfrey's *History of Napoleon I.* and the first volume of the posthumous and unpublished *Memoirs* of Odilon Barrot.

OUR esteemed correspondent in Paris, M. Gabriel Monod, will publish on January 1, 1878 the first part of an *Historical Review*. It is to appear quarterly, and will consist of from 1,000 to 1,300 pages a year, containing original documents and correspondence from all countries

together with a bibliography which will keep the reader of the *Revue* informed of the historical movement throughout the literary world. MM. L. Renier, Duruy, Fustel de Coulanges, Taine, Thurot, G. Paris, R. Reuss, and other distinguished writers, have already promised their co-operation. The annual subscription will be 30 fr., and intending subscribers may send their names to the Editor, 76 rue d'Assas, Paris. We have great pleasure in calling the attention of our readers to this new review, which promises to be of great value to all who are interested in historical research.

Det nittende Aarhundrede for April contains a very able and interesting monograph on Giordano Bruno, by Professor H. Bröchner. Viktor Rydberg continues his "Roman Emperors in Marble," and Paul Heyse contributes a pretty little novelette called the "Empress of Spinetta." Eduard Brandes gives a minute account of "A Turning Point in the History of the Danish Theatre," the confusions and bitternesses that led to the resignation of the great actor Høedt in December, 1857, and from which dates, in the writer's opinion, the period of absolute decay of the Danish stage. The article is clever, but takes altogether too pessimist a view of the present position.

THE Norwegian poet, Jørgen Moe, author of some of the most delicate and perfect lyrics in the language, and fellow-worker with P. C. Asbjørnsen in the labour of collecting the "Norse Folk Tales," is spoken of as likely to be the next Bishop of Christianssand, a diocese just vacant by the death of the last prelate. The see has been held by a poet before, namely, by Johan Storm Munch, who died in 1823.

ON April 2 last was Hans Christian Andersen's seventieth birthday. We understand that preparations had been made for extensive festivities both at Copenhagen and at Odense, the poet's birth-place, of which we hope to be able to give full particulars next week. Andersen's health appears to be in great measure restored.

THE so-called "William's Tower," at Dillenburg, intended as a memorial in honour of William the Silent of Orange, who was born in the town, is to be opened with great state on June 29.

THE Empress Augusta has headed the list of subscriptions for the establishment of a hall for students attending the University of Berlin with a donation of 3,000 mark (150*l.*).

THE German Imperial Admiralty has brought out, under the editorship of one of its hydrographers, Dr. G. Neumayer, a "Guide," or "Code of General Instructions for efficiently conducting scientific observations in foreign regions." The work is divided into twenty-eight separate parts, and while it undertakes to teach ordinary travellers how to use their senses to the best advantage, it points out how they may make their observations conducive to the benefit of science generally, and of the scientific requirements of the German Marine in particular. The work, under the unostentatious title of a manual, is in fact a complete encyclopædia of human knowledge, for the compilation of which some of the very highest authorities in Germany have supplied the materials.

It is now currently reported that Professor Waitz has accepted the invitation of the Imperial Government to migrate from Göttingen to Berlin, in order that he may assume the chief direction of the *Monumenta Germaniæ*, which has been offered to him at a salary of 6,000 Thl. He will have as his associates in the labour of completing this important national work, Dr. Pertz of Berlin, Dr. Euler of Frankfurt-on-the-Maine, Herr Tietzel of Vienna, Herr Stumpf-Brentano of Innsbruck, Dr. Hegel of Erlangen, Professor Mommsen of Berlin, and Herr von Giesebrecht of Munich. The ninth place at the board of management, which became vacant by the death of Dr. Blume, of Bonn, has not yet been filled.

WE have received *A Treatise on Arithmetic*, by J. Hamblin Smith, M.A., third edition (Rivingtons); *Life in Nature*, by James Hinton, second edition (Smith, Elder & Co.); Von Cotta's *Development-Law of the Earth* trans. R. R. Noel (Williams & Norgate); *The Decline of Turkey, financially and politically*, by J. Lewis Farley, second edition (the author); *Lecture on the Tendency of Trades Unionism*, by Peter Graham, Esq. (Stanford); *A Few Words on Vivisection* (Williams & Norgate); *Am Sarge und Grabe des D. th. Constantin von Tischendorf* (Leipzig: Hinrichs); *The Dramatic Works of William Shakespeare*, ed. S. W. Singer, Vol. V. (Bell); *Events to be Remembered in the History of England*, by Charles Selby (Lockwood); *Results of the "Expostulation" of the Right Hon. W. E. Gladstone* (King); *A Letter addressed to the Duke of Norfolk*, by J. H. Newman, D.D. (Pickering); *Twenty-First Annual Report of the Brighton and Sussex Natural History Society* (Brighton: Fleet & Bishop); Mackeson's *Guide to the Churches of London for 1875* (Metzler); *A Few Words about Bearing-Reins*, by E. F. Flower (Ridgway).

THE following Parliamentary Papers have lately been published:—Correspondence with British Agents abroad, and Reports from Naval Officers, relative to the East African Slave Trade (price 1*s.* 7*d.*); Appendix to the Second and Final Report of the Commissioners appointed to enquire into the working of the Master and Servant Act, 1867, and Criminal Law Amendment Act, &c. (price 1*s.* 4*d.*); Return of the Number, Names, and present Residences of Clergymen in the Irish Church, who have commuted under the Irish Church Act (price 4*d.*); Correspondence relative to the Kirwee Booty (price 8*d.*); Return of Fee Simple Land exposed for sale in the Landed Estates Court, Ireland; Return of the Cost of the several Colonies of the British Empire from 1869 to 1873; Army (Manufacturing Establishments) Return (price 2*s.* 2*d.*); Army Estimates of Effective and Non-effective Services for 1875 to 1876 (price 2*s.*); Memoranda by Colonel Pasley, R.E., explanatory of vote No. 11 (relating to dockyard and breakwater extensions) of the Navy Estimates, with plans (price 2*s.* 4*d.*); Papers relating to the Emancipation of the Negroes of Puerto Rico (price 4*s.* 4*d.*); Thirty-sixth Report on Prisons in Scotland (price 10*d.*); Report on the Colony of Assunguy (price 10*d.*).

IN *Blackwood* the gracious and fantastic history of Alice Lorraine ends happily with the discovery that Agasicles, the Carian astrologer, had discovered how to make artificial opals; six of his collection are sold for 65,000*l.*, and the family gets out of all difficulties. "In a Studio" contains a great many unsifted anecdotes from Pliny and elsewhere about the prices of ancient works of art, and an ingenious suggestion that the Clytie is a portrait of Poppæa, who is known to have been modest in manner, and was slain by her beloved as Clytie was slain by Apollo, whom Nero claimed as his father.

IN the *Cornhill Magazine* there is an interesting and tantalising article on the cost of living. The writer shows that the things which have got cheaper, like travelling and grocery, represent as large a proportion of expenditure as those which, like meat and house rent, have got dearer; but he does not allow for the rapid growth of wants which are conventional, not optional. The editor's most interesting article on William Hazlitt is a little disfigured by an assumption which runs all through it, that he ought to have done more, which means that he could have done more. In mortifying his eccentricities he would have mortified his talent, though he might have improved his character and his chance of happiness.

IN *Macmillan's Magazine* Mr. Freeman discusses Mr. Parker's theories about the ancient fortification on the Palatine, &c., and the questions raised by

the substructions discovered in the Coliseum: he tells us that the Goths turned the amphitheatre at Spoleto into a fortress, "not by making subterranean walls, but by blocking up its arches," which is rather an odd rendering of *siatōnc*.

Principal Shairp defends Keble's estimate of Milton against Mr. Pattison, by pointing out reserves which Keble would certainly have made; and Mr. Hullah informs us that Macchiavelli was the author whom Sir Arthur Helps quoted most often, and with most sympathy.

FROM an article on the Gilded Age in the *Revue des Deux Mondes* for March 15 we learn that Mr. Hepworth Dixon's talent is distinguished by elevation of view, exquisite penetration, a charm full of *finesse*; from an article on the last revolution in Buenos Ayres, that most of the respectable natives were on Mitre's side, but that the foreign majority in Buenos Ayres itself compelled them to abandon the capital, after which the insurrection was hopeless. In the number for April there is an article on the abortive attempts which have been made since 1872 to bring back the trade of the Sahara to its old route through Algiers; since the conquest it has diverged to Tunis and Morocco, both of which markets are occupied by English or Spanish goods, to the exclusion of French.

IN the *Fortnightly Review* Professor Clifford's article on the First and the Last Catastrophe is less exciting than its title. Most of it is taken up with explanations of the gaseous and fluid states of matter, and of what we know of molecules, which are sufficiently clear to enable an audience to share his civil contempt for anybody of less scientific eminence than Dr. Clerk Maxwell, who presumes to draw theistic inferences from the presumable uniformity of the molecules of oxygen or the limits of geological time. J. O. Morison complains that Mr. Pattison fails to enable us to understand Casaubon's rank and services as a scholar; but is otherwise egological.

IN the *Contemporary Review* E. H. Beverstock gives a *précis* of Maimbourg's forgotten and somewhat obsolete arguments against Papal Infallibility. Professor Whitney's article "Are Languages Institutions?" is rather at cross-purposes with his opponents; he is a clever man, has a plausible though perhaps a premature theory of how human language began when sign-making by instinct became sign-making by intention; from the vantage ground of this theory he criticises the speculations which European philologists pursue, for the most part rather *en papillotte*, and holds them up to the condemnation of American common sense. Naturally this method raises him rather disproportionately in the eyes of his own public, and makes his opponents rather disproportionately angry. Mr. St. George Mivart's paper on Instinct and Reason is an ingenious series of appeals from Mr. Herbert Spencer to Messrs. Tylor and G. H. Lewes, otherwise chiefly remarkable for the reiteration of the curious paradox that the gulf between rational and irrational is harder to pass than that between organic and inorganic.

IN *Fraser's Magazine* Mr. Carlyle discusses the portraits of Knox with the following results:—The Torphichen portrait is clearly akin to that in the first edition of Beza's *Icones* in 1580; so probably is that by Hondius published by Van Heiden in 1602; while the portrait in Goulart's translation of Beza in 1581 is clearly Tyndall inserted by mistake. He decides in favour of what is called the Somerville portrait, which he thinks is a copy of Kneller's time, or later, of a valuable original which may have been by Porbus, who is known to have painted Buchanan about 1565. Between the discussion of the portraits which he rejects, and of that which he accepts, there is a fragmentary life of Knox.

"A German" writes to explain that the hideous shabbiness of German home life, as described in *Fraser*, is due to the fact that the literary, professional, and official class in Germany is much larger and poorer than the analogous class in

England; "one might even say, on an average, that a German holding the social position and having the mental culture of a Queen's Counsel or an Oxford Professor possesses the pecuniary means of a Manchester workman."

In the "Secret Papers of the Empire" we are reminded of the abject way in which Zumpt and Ritschl flattered the author of the *Vie de César*.

NOTES OF TRAVEL.

THE chapters in the book, containing reprints of geographical and ethnological papers, which the Geographical Society is printing, at its own expense, for the use of the Arctic Expedition, will be as follows:—The first chapter, by Dr. Robert Brown, on the physical structure of Greenland, contains nine sections on the Greenland coast-line, on the interior of Greenland, on Greenland glaciers and sea ice, on the action of sea ice, on the rise and fall of the Greenland coast, on the application of facts regarding Arctic ice-action as explanatory of glaciation and other ice-remains in Britain, on the formation of fiords, on the northern termination of Greenland, and on the debateable points regarding the physical structure of Greenland. Then follow papers on the best means of reaching the North Pole, by Admiral Wrangell; on the discoveries of Dr. Kane, by Dr. Rink; and on the Arctic current around Greenland, by the Danish Admiral Tominger. Admiral Collinson contributes four valuable papers on the Russian explorations west of the river Kolyma, on the exploration of the Polar Sea between Point Barrow and the river Mackenzie, on the state of the ice along the coasts of Siberia and Arctic America, and on Behring's Strait. The ethnological portion of the book comprises four papers on the Greenland Eskimos, by Mr. Clements Markham; namely, on the origin and migrations of the Greenland Eskimo, on the Arctic Highlanders, the Eskimo language with classified vocabularies, and a list of names of places with meanings on the coasts of Greenland. There are also papers by Dr. Rink on the descent of the Eskimo, and by Dr. Simpson on the Western Eskimo, the Report of the Anthropological Institute, and a series of questions drawn up by members of its Council.

THE Havildar, who was sent into Central Asia on an exploring expedition, by the Superintendent of the Great Trigonometrical Survey, has returned to head quarters after completing an adventurous and very important journey. He has examined a portion of the course of the Oxus, where the river makes a great bend along the northern frontier of Badakshan, and has just supplied new geographical information of much value. The Havildar's work will not be reduced and ready for publication for some weeks.

WE regret to have to announce the death of that enterprising young missionary, Mr. Charles New, who fell a victim to the climate during an expedition into the interior of Africa from Mombasa. Mr. New made the first successful ascent of the equatorial snow mountain, Kilima-njaro. He was a careful observer and an energetic and courageous traveller, and his untimely end is much to be deplored.

THE death of the African explorer Karl Mauch is also announced.

THE surveyors of Palestine are now engaged in the south, which they expect to finish off before the summer. The winter has been one of unexampled severity, and field work was necessarily suspended for some time. As regards the collection of names, Lieutenant Conder reports that he has, up to the present, a list of nearly 3,000 in Arabic. The most important of the recent identifications proposed in his last letters is that of Bethabara, the place where John baptised. The word means simply the "House of the Crossing over," or Ford, and therefore might apply to many points in the course of the Jordan. The

place has generally been identified with Beth-nimrah, but Lieutenant Conder shows that this site is too far south, one condition being that Bethabara should be within a two days' journey of Cana in Galilee. Upwards of fifty fords of the Jordan have been found in the progress of the survey, only eight of which appear in the latest map. Among them, at a distance of twenty-five miles from Nazareth, is one called Makhadet Abára, the "Ford of the Crossing-over." It is described by Lieutenant Conder as one of the principal northern fords; the great road descending Wady Jalud on its northern side, and leading to Gilead and the south of the Hauran passes over it; the river bed is more open than at other places, and the steep banks of the upper valley further retired, leaving a broad space for the collection of the great crowd which followed John the Baptist. There are no traces of the ancient village on the spot, but then there are hardly any ruins, except of Christian times, in the Jordan valley. If the identification is accepted, another difficulty in Biblical topography will be removed. Lieutenant Conder thinks that the Bethabara of the Book of Judges must not be confounded with the Bethabara of the New Testament. The new number of the *Quarterly Statement* of the Palestine Fund, now in the press, contains his paper on this site. Among the other papers are an account of the German excavations in the Muristan, those of Mr. Henry Maudslay on Zion, showing the old scarp of the rock and the course of the first wall; the complete survey of Tell Jezer, where M. Clermont Ganneau discovered the boundary stones of Gezer; and a paper on a subject rarely touched upon, the mediæval topography of Palestine.

THE Russian *Golos* says that Government proposes to despatch during this spring four expeditions composed of civil engineers and naval officers, with the necessary complement of workmen, to survey the lakes, canals, and rivers which form the system of interior navigation in Russia. The first expedition will explore the Svir, Vytegra, and Kovgha rivers, the White Lake, the Szeksna, and the course of the Volga between Rybinsk and Nijni-Novgorod. The second will examine the Kama and the Tchusovaya; while the other two will occupy themselves with the Don and Dnieper and their affluents.

M. MIKLUCHO MAKLAY, the Russian traveller, has returned to Singapore after a fifty days' tour in the interior of the Tabor country, in the Malay peninsula. The object of his journey was to make researches on the ethnology of certain semi-savage races in the mountains inland. The Rajah of the country gave M. Maklay a safe-conduct addressed to various chiefs through whose territory he would have to pass, and this facilitated his progress, which was made partly on foot and partly by boat. He has made several interesting discoveries respecting the manners, customs, and idiosyncrasies of this hitherto unknown race.

THE melancholy death of Mr. Margary and failure of the Yunnan expedition, as well as the frontier difficulties with Burma, have invested the intervening country between India and China with special interest at the present time. We are glad, therefore, to welcome a very useful map of this region in the April number of the *Geographical Magazine*, accompanied as it is by an article from the able pen of Colonel Yule. The Colonel says that he has seen nothing to modify his former opinion, that the prospective commercial advantages to be derived from free intercourse with Yunnan are not so great as many would have us believe, and that one must avoid expecting that the wealth of a vast and varied part of the earth's surface will commence to flow in a new direction simply because that part happens to be known by one name, China. To this we would add that, even were Western China tranquillised, it is doubtful whether it could develop a brisk

export trade. Even at Shanghai (as appears from the most recent consular report) trade is paralysed by irregular and excessive taxation and by the want of cheap and speedy means of transit. How much more would this not prove to be the case in a province so far removed from the central seat of government as Yunnan?

OTHER articles in the same periodical are an interesting paper on Beccari's travels in the East Indies; a practical series of hints respecting the noting of unknown rocks and new dangers at sea, from the pen of an old Indian Navy officer; an obituary notice of the late Sir Henry Kellett, K.C.B.; and the usual allowance of reviews of books and maps, among which will be found a paragraph devoted to a critical dissection of the now notorious *Cabinet Atlas* of Messrs. Johnston.

AT the meeting of the Royal Colonial Institute, held on the 16th ult., a paper was read by Mr. Michie, Agent-General of Victoria, recommending the occupation of New Guinea by the British Government. His argument was supported by Captain Moresby, who had just returned from the exploration of the Eastern Coast, and who spoke favourably of the climate and of the natives, whom he described as an amiable race disposed to trade with Europeans. Gold had been discovered in the island by some of his party.

A VERY rich bed of iron ore has been discovered in Nordland, in the Arctic part of Norway. The ore, which is what is called blood-stone, gives from 60 to 67 per cent. of iron, and is free from phosphorus and sulphur. It is expected that this new bed will produce quite as much and as good metal as the famous mines of Dannemora, in Sweden; and the fact that it lies only a Norse mile from the little sea-port of Bodö, a haven which is never frozen over, makes it of great commercial importance. A Swedish speculator has already bought the right of working the mines.

COLONEL IVANOF has made a successful march from the fort of Petro-Alexandrovsk on the Oxus to Kunia-Urgenj and back, with the object of making a display of force, and, if necessary, repressing the aggressive movements of the nomad Turkomans, who have refused to obey the Khan of Khiva, have harassed his subjects, obstructed caravans, and made themselves exceedingly obnoxious for some time past. Colonel Ivanof's little force was composed of seven companies of infantry, two and a half sotnias of Cossacks, and eight pieces of artillery. He crossed the Oxus near Khojeili, the governor of the town having provided him with means of transport, and passed in succession several of the Turkoman settlements, the chiefs of which in many cases came to proffer their formal submission, the Yomuds being the only ones to hold aloof. A recent telegram from Tashkend announces the return of Colonel Ivanof to Petro-Alexandrovsk, after a satisfactory tour. The health of the troops had been good, though forty degrees of frost had been experienced.

A TELEGRAM has been received at Berlin by the Germano-African Society announcing the safe arrival at Loanda of Captain von Homeyer, who is reported to have started for the interior on February 11, and to have been well received at every station which he had visited. Captain Homeyer, who is chief director of the Second German Expedition to the Congo, and who is specially distinguished as an ornithologist, has obtained from the German Emperor a three years' furlough from his regiment (one of the Silesian Fusilier Guards), in order that he might devote himself thoroughly to the duties which he undertook last year, on behalf of the Germano-African Society, to make a scientific examination of the districts on the Congo which they were desirous of colonising. Another German officer, Lieutenant Stumm—who, as has been already noticed in our own papers, was the only foreigner allowed to take an active part in the Khiva Expedition of

General von Kauffmann, on whose staff he served through the whole campaign—has just brought out at Berlin a narrative of his personal experiences of life in Central Asia. The book is in the form of a journal, but Lieutenant Stumm is at present engaged in writing a larger work, in which he proposes to give the natural history of the interesting districts which he had the singular good fortune of being able to examine with much care.

BOSTON LETTER.

Boston : March 18, 1875.

The second volume of Mr. Hubert H. Bancroft's work, *The Native Races of the Pacific States*, is to appear shortly. It treats of the civilised nations, namely the Nahuas, representing the Aztec civilisation of Mexico, and the Mayas, representing the Maya-Quiché civilisation of Central America. Of these two branches the latter is the more recent and the wider-spread. This classification is one made more for convenience than as a strict definition; under both heads may be found included races which bear no real affinity to either the Mayas or the Nahuas. The Aztec empire proper is defined as having extended from the valley of Mexico and its immediate neighbourhood, through the existing Mexican States, Puebla, southern Vera Cruz, and Guerrero, but the title of Aztec belongs also, less definitely, to the whole country north of the isthmus of Tehuantepec. The Mayas were confined to the district south of this isthmus.

It is to the sixth century of the Christian era that trustworthy information about the Nahua civilisation goes back. At this period the Toltecs are found in possession of Anáhuac and the neighbouring country. Their sway lasted until the middle of the eleventh century, when it was succeeded by the Chichimec empire, which endured, with various changes, until the coming of Cortés, just as the Aztecs were becoming powerful. After a brief synopsis of the scattered threads of this early history, Mr. Bancroft devotes the rest of the volume to an account of the manners and customs of the Nahuas and Mayas respectively. This subject he has treated with the greatest fulness, dividing it into five parts. First, the systems of government; the laws of succession; the ceremonies of election, coronation, and anointment; and finally, the details of the life of the kings. Secondly, the social system; the divisions of society; the taxation, tenure, and distributions of land; vassalage and feudal service; the domestic life of the people; the laws and customs with regard to marriage, divorce, and education; their amusements, dress, food, medicine and mode of burial. Thirdly, what concerns war. Fourthly, their commerce, trade, sciences, arts, and manufactures. Fifthly, their legal affairs.

It has been no easy matter for the historian to unravel the truth from the vast amount of conflicting evidence about the Aztec civilisation. Mr. Bancroft acknowledges this difficulty, and makes no statements without definite reference to his authorities. He says in summing up:—

"The character of the Nahuas, although the statements of the best authors are nearly unanimous concerning it, is in itself strangely contradictory. We are told that they were extremely frugal in their habits, that wealth had no attractions for them, yet we find them trafficking in the most shrewd and careful manner, delighting in splendid pageants, gorgeous dresses, and rich armour, and wasting their substance in costly feasts; they were tender and kind to their children, and solicitous for their welfare, yet the punishments they inflicted upon their offspring were cruel in the extreme; they were mild with their slaves, and ferocious with their captives; they were a joyous race, fond of feasting, dancing, jesting, and innocent amusements, yet they delighted in human sacrifices, and were cannibals; they possessed a well-advanced civilisation, yet every action of their lives was influenced by gross superstition, by a religion inconceivably dark and bloody, and utterly without one

redeeming feature; they were brave warriors, and terrible in war, yet servile and submissive to their superiors; they had a strong imagination and, in some instances, good taste, yet they represented their gods as monsters, and their religious myths and historical legends are absurd, disgusting, and puerile."

While it would be hard to find a people which could not be charged with similar apparent inconsistencies, the particulars of some of the Aztec customs are very remarkable. This people seems to have added a sort of ornamental civilisation to a savage nature, which was not, on the whole, an excessively brutal one. The pomp of their sacrificial rites indicates this. The altar of the temple at Mexico was a green stone, probably jasper, convex above, about three feet high, as many broad, and more than five feet long. The robes of the officiating priests were brilliant; the chief priest had his ears adorned with golden ornaments, his under lip with a pendant of turquoise, and the heart of the human victim was laid bare by an obsidian knife, and sometimes placed in the mouth of an idol in a golden spoon. This is one of the extreme examples of the frequent combination of savageness and a gilding of civilisation. The people, however, had one strong claim to be counted among civilised races, namely, the weight of the taxes. These amounted to nearly one-third of everything made and produced. One authority states that in addition each taxpayer had to give one out of every three of his children, or in its place, a slave, for the sacrifice. His life was forfeited if he failed to do this.

It would be impossible by fragmentary extracts to give a satisfactory impression of the book, which is a well-arranged collection of curious and interesting facts. Mr. Bancroft is certainly doing his work well.

Mr. Nordhoff's *Politics for Young Americans* is a concise statement of such views as truly deserve to be spread among those on whom the future of this country rests. If it were the custom among human beings to profit by the wisdom of their ancestors more than by the pernicious results of their own folly, there would be good reason to hope that this book would have a beneficial influence. With those who agree with it it doubtless will, but those who believe that our paper-money is the "best currency the world ever saw," and that gold "is no more essential to our financial prosperity than the fly on the driving-wheel is essential to the speed of the train" (to quote from the records of the Congressional debate on the currency in 1873-74), will consider Mr. Nordhoff's little volume as a very dangerous publication. On such important matters as property, money, labour, and capital, usury, banks, &c., &c., it will be found to express clearly wise opinions. The author has taken care, and he has generally succeeded in his intention, "to explain in simple language and by familiar illustrations fitted for the comprehension of boys and girls, the meaning and limits of liberty, law, and government, and human rights, and thus make intelligible to them the political principles on which our system of government is founded." Consequently he has written a book which would be an admirable and intelligible manual not much above the comprehension of a member of Congress. Naturally enough—for the book grew out of an attempt on the part of the author to give the rudiments of political instruction to his own son—there is a good deal of unsupported assertion, such as is well enough in families which are not debating societies, and some prejudices are to be found rather absolutely expressed; but on the whole a father need have no shame for a son with as good principles as this book teaches.

The book about Harvard College, which you have already announced, will soon appear. It will be a large and costly volume, its price in the cheapest form being \$30.00, and it will be full of all sorts of information about the college. Beside the history of the college by Mr. Samuel Eliot, there will be descriptive and historical articles by

Professor J. R. Lowell, Mr. O. E. Norton, Dr. O. W. Holmes, Mr. R. H. Dana, jun., Professor Asa Gray, as well as many others less known to fame. It will also contain heliotype of the generally graceless buildings of the college, and very many engravings.

Another publication with which the college is concerned is to appear soon under the auspices of the Harvard College Observatory. This is a report of the recent investigations of Mr. Charles S. Peirce, who has measured photometrically the magnitude of all the stars between 40° and 50° declination, visible to the naked eye, about 500 in number, by means of Turner's astrophotometer. He has also reduced the magnitudes of Ptolemy, Ulu Begh, Tycho Brahe, Havelius, Sir William Herschel, Argelander, Heis, the Durchmusterung, Sir John Herschel, Seidel, Zollner, and his own to a uniform scale, and has made a comparative catalogue of the different measurements of the same. The numerous observations of Sir William Herschel had, I believe, never hitherto been made available. Mr. Peirce has also investigated the probable errors of all these observers, and made some inferences with regard to the general variability of stars, and with regard to the form of the galactic cluster.

The alleged Raphael, of which I spoke in my last letter, has been on exhibition in this city. A little circular, which was given to those who gazed at it by an attendant, spoke more warmly in defence of the origin claimed for it than did anything in the picture itself. It has now gone back to its original obscurity.

This device of instructing the public has also been followed by the composer of the programme of a concert given in this city a week or two ago. The orchestra was that of Theodore Thomas, and the music consisted entirely of Wagner, "the reformer and most prominent musician of the day," according to the programme. The following testimonial of an unknown but ardent J. H. C. tends to put the docile listener into the proper mood for the enjoyment of music:—

"If Music has a higher and nobler mission than to simply tickle the ear—if it is a language supplementary to speech, and of almost unlimited powers of expression, so that there is hardly anything within the range of human experience which it may not in its own way illustrate—then may Richard Wagner be said, pre-eminently among modern composers, to have fully apprehended the nobility of his art, and to have been initiated into the secrets of its wonderful powers. This explains why it is that, as a general rule, his music is not at first liked—it is so full of meaning which is not understood except perhaps to a very few. But when we know what the poet-musician means, we must, unless we are miserably prejudiced, recognise," &c.

Here, as elsewhere, the contest between music and Wagnerism is going on. At present the "miserably prejudiced" present a tolerably solid front to the alleged reformers, and "grand Wagner Concerts" are few. The fight, however, has not yet fairly opened, although preparations of all sorts have been going on for some time. The unmusical nature of the American people, and their fondness for what is new and noisy, tend to free them from prejudices.

CORRESPONDENCE.

ARYAN ORIGIN OF THE FINNISH NAME FOR IRON.

St. Petersburg: March 25, 1875.

Allow me to correct an inaccuracy into which Mr. Sayce, following M. Lenormant, has fallen in his article in the ACADEMY for March 20. He says there: "Indeed, as M. Lenormant has pointed out, the word for bronze (*urud*) is identical with the Finnic term for 'iron,' showing that the Turanians had already begun to work the metals before their separation." The word for iron, to which M. Lenormant refers, now prevalent in the West-Finnish languages, is in Finnish and Votian *rauta*, Esthonian and Vepsian *raud*, Livian *raud*, *raod* or *rōda*, and Lapp *ruovdde*. It is not, however, an original word common to all the Finnic languages—the connexion of which with the so-called Accadian does not yet seem clearly established—but comes from what appears in Russian as *ruda*, the usual word for ore, especially iron ore. The same word is found in all the Aryan languages which surround the Baltic Finns. In Lithuanian we find: *rūda* ore, metal, *rūdis* rust, iron rust, *rūdas* reddish brown, *raudà* red, *raudus* a mass of ore; and in Lettish *rūds* reddish, brown. The Russian *ruda* also means blood. It is certainly an Aryan word, and is connected with the Gothic *raude* red, Old Norse *raute* red, *raudr* iron ore, English *red*, *ruddy* and *rud*, *ruddle* red ochre, red iron ore. The idea of redness is at the bottom of all the words, which have been applied to the most common iron ore on account of its characteristic red colour. The opinion which I have just given as to the Aryan origin of the Finnish name for iron is that of Professor Ahlqvist of Helsingfors, the greatest authority on the Finnic languages, and I would refer Mr. Sayce to his interesting book, *De Vestfinska Språkens Kulturord* (Helsingfors, 1871), a German translation of which is soon to appear. It is an exceedingly valuable contribution to the history of Finnish civilisation.

As the supposed origin of the word *rauta* was used by M. Lenormant, if my memory of the passage is correct, as a sort of crucial test of the degree of early civilisation of the Accadians, it shows that great caution should be used in studying the affinities of the erroneously so-called Turanian languages. EUGENE SCHUYLER.

ANCIENT MOSQUITO-NETS.

Bottesford Manor, near Brigg.

It may, perhaps, be worth while to point out that nets to protect the persons of sleepers from the attacks of noxious insects, though perhaps at

no time very common in this country, were known in former days to others beside Richard Bishop of London (ACADEMY, p. 314). There was a "bedstead with a net for knatts" in the new chamber at Sawtre Abbey, when an inventory of the goods of that establishment was made at the time of the dissolution of the monastic corporations. (See *Archæologia*, xliii. 1. 240.)

I have met with one or two other notices proving that these nets were in use in old days, but I cannot now call to mind where they are.

Bartholomew Glanvil, in his *De Proprietatibus Rerum* (Trevisa's version) has a chapter in which he tells with the deep feeling of one who had evidently suffered much how—

"A gnatte is a lyttell flye" that "soucketh bloudde, & hath in his mouthe a pype like a prick, and there with he perceeth the flesche for to soucke the bloudde. . . . And is gendred of rotted or corrupt vapours of caraynes and corrupt place of marreys. By continuall flappinge of wynges he maketh noyse in the ayre as though he hurried . . . and greueth slepyng men with noyse and with bytynge, and waketh theym of theyr reste, and fleeth aboute mooste by nyghte, and perceeth and byteth membres vpon whiche he sitteth."—Edit. 1535, p. 169.

EDWARD PEACOCK.

HANDEL AND BACH.

3 Wetherby Road, South Kensington: April 5.

Your musical critic, in his notice, in the current number of the ACADEMY, of the Crystal Palace Concert on the previous Saturday, draws attention to the "most singular resemblance between the theme of the opening chorus of Bach's cantata 'My spirit was in heaviness' and that of the trio 'The flocks shall leave the mountains' in Handel's *Acis and Galatea*—remarking especially on the extension of this resemblance to "the treatment of the subject by imitation in the seventh at half a bar's interval." Mr. Prout does not suppose—Handel's notorious habit of appropriating the thoughts of others notwithstanding—that the great composer had borrowed the subject from Bach; regarding it as improbable that he had ever had the opportunity of hearing the work of the latter; but points to the circumstance as a simple but most remarkable coincidence, rarely to be paralleled in the range of music.

The object of these few lines is to direct the attention of such of your readers as may be interested in the point to an old Italian melody—"Col freddo suo velen," of apparently unknown authorship, in which the same theme appears, with a suggestion, in the bass, of the particular treatment noticed by Mr. Prout, and with further points of correspondence, which make it difficult to suppose Handel could have been ignorant of this air when he penned the exquisite trio in question.

The air will be found in the second volume of Crotch's *Specimens*, having been taken from the collection bequeathed by Dean Aldrich to the library of Christ Church, Oxford—its priority to either Bach or Handel being thus pretty well established. Does it not seem probable that this old Italian song was familiar to both the great composers, who, if so, have used it in the same noble way as Shakspeare his borrowed material, and with kindred amplitude of development, moulding it by the force of their own genius and shaping it into a new and consummate work of art. That the correspondence between the Italian air and Handel's trio struck Dr. Crotch may be safely inferred from the small notes added by him.

G. DOWNING FRIPP.

MR. PARISH'S GLOSSARY OF THE SUSSEX DIALECT.

1 Cintra Terrace, Cambridge: April 6, 1875.

May I be allowed to say that I am extremely sorry that your reviewer should have been led to ascribe to Mr. Parish several mistakes that were really due to myself, if indeed they are mistakes?

I have received so many letters from correspondents, expressing their satisfaction with Mr. Parish's book, and it is, for the purposes of the English Dialect Society, so extremely useful a work, that it is a little hard to find that, in the pages of the ACADEMY alone, the imperfections of it have been rather severely insisted upon. I think it will bear comparison with such works as those of Forby, Moor, and others, which have been for some time well known and of acknowledged utility.

But what I am most concerned about is, to obtain further information upon some of the supposed errors. I want to know wherein consists the absurdity of connecting the word *kell* (a kiln) with the Welsh *cylan*, or the word *dole* with the A.S. *dol*? It was not intended to be implied that the words are absolutely derived from the forms given, only that there is a connexion between them. This has long been the practice in English etymology; any one who looks out *kiln* in Wedgwood or Webster will find the Welsh *cylan* duly cited. I am not defending the practice, and I think it high time that phonetic considerations should begin to find a place in our etymology; I only submit that it is hardly fair to single out this particular book for attack, because old habits have been complied with; and I extremely regret it because, partly through my desire to help forward the work, the weaker points of it have invited comment, and Mr. Parish has come in for but small thanks.

In particular, I wish to know if any further information is to be had. Your reviewer says, "to those who can detect the blunders, the etymologies which happen to be correct are familiar;" in reply to which I have to say that I shall be obliged by being made acquainted with such etymologies, that the English Dialect Society may print a list of them. We are extremely anxious to print all corrections and emendations, that the accumulation of information may at last become valuable. The work of collecting is humble, and errors will creep in, but it is a very important duty; and we hope, by continual corrections and additions, to perfect the work at last. For this reason, a list of corrections, duly forwarded to me, will be very thankfully received. After some experience, I may say that the endeavour to correct etymologies is much harder work than it appears to be, and the certainty that it will be found fault with, after all, is not very encouraging.

Another remark is, that "where there is any real difficulty, no assistance is given." How could it be? How can I tell the etymology of a word which the reviewer does not even know himself? Surely, it is better to be silent in such a case, and to say nothing instead of indulging in guesswork. It is just this guesswork which is the curse of English etymology. WALTER W. SKELAT.

MRS. KINGSFORD'S "ROSAMUNDA THE PRINCESS, AND OTHER TALES."

Savile Club: April 6, 1875.

I am a little surprised that Mrs. Kingsford should think that a reviewer in the ACADEMY could attack her with anything like personal animosity; but after reading her letter I am not surprised that she should feel herself aggrieved by a review which, having to deal with a large number of volumes in a very limited space, laboured to be brief and became obscure. If, therefore, any reader of the review was led by it to form an opinion hostile to Mrs. Kingsford's character as an upright and pure-minded woman, or to believe that she wilfully advocated a pernicious system of morals, I beg to say that I meant nothing of the sort. It is quite true, and I am happy to have this opportunity of stating, that there is not in the tale one gross word, one immoral thought, or hint of the advocacy of vice which she thinks I imputed to her.

I based the article on two hypotheses. I presumed that Mrs. Kingsford's tale was written to

illustrate a political pamphlet on women's rights published by her in 1868, and founded this supposition on the ground that Mrs. Kingsford held up her heroine, Rosamond the Goth, as the type of a "true, strong-minded woman," and one of a class that she prayed might again be born into a regenerate world. I also presumed that Mrs. Kingsford was as well acquainted with the true character of Rosamond as all readers of Gibbon and the older historians; and founded this supposition on a preface which undertook to reproduce the facts of history "as on the table of a camera." Mrs. Kingsford's letter now makes it very plain that she had forgotten her pamphlet, for she accuses me of inventing a passage which I quoted from it. It also shows me that she has not read Gibbon and the older historians, but drew her heroine from the lays of the minnesingers and the romantic poets. My hypotheses therefore crumble away, and because they are erroneous I am very willing to offer the "amplest reparation" to Mrs. Kingsford, as Mrs. Kingsford the woman.

But before Mrs. Kingsford the writer I am wholly unable to shift my ground. History has its rights as well as women, and historical examples which are quoted with a view to social reform may not be drawn partly from history and partly from romance. Moreover, if Rosamond were simply the murderess Mrs. Kingsford makes her to be, nothing deserving the imitation of her sex can be found in the career of a woman whose sole claim to greatness is that her wrist was as strong as her passions. These apotheoses are highly dangerous to society. If writers choose to set up Judith the Bethulian as their standard of patriotic devotion, they must remember that the assassins both of Henri III. and William of Orange put forward the murder of Holofernes in their defence. If they think that Beatrice Cenci could "o'erbear suspicion with such guiltless pride as murderers cannot feign," they strike at the laws on which civil and domestic well-being is founded. If they condemn the execution of Charlotte Corday, they say that excessive tyranny justifies a maiden in buying a sheath-knife and slaying the tyrant as he stews in a slipper-bath. Positive law, which is based on the single and indivisible motive of the common good, and the law of universal opinion, which is based on a thousand variable motives, are sometimes necessarily at odds. The sentiment which takes these heroines from their high offices in poetry and the drama, and cites them as precedents on a point of law, is the false sentiment against which jurists and men of practice have long had to contend. But among this poetic sisterhood Rosamond, wife of Alboin, has no place at all. Even by Mrs. Kingsford's showing she was criminally vindictive in her rage; and history gives her such names as the pen shrinks from writing.

WALTER MACLEANE.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, April 10, 3 p.m.	Physical: Papers by Professor H. MacLeod and Mr. J. Barrett.
"	Royal Institution: Mr. G. Smith on "The History of Assyria."
"	Crystal Palace Concert (Herr Paer).
3.45 p.m.	Royal Botanic.
MONDAY, April 12, 3 p.m.	London Institution: Professor Bentley on "The Classification of Plants." II.
8 p.m.	Medical.
"	Second Philharmonic Concert, St. James's Hall (Raff's <i>In Walde</i>).
8.20 p.m.	Geographical.
TUESDAY, April 13, 3 p.m.	Royal Institution: Professor Duncan on "The Grand Phenomena of Physical Geography."
8 p.m.	Anthropological Institute: Professor Rolleston on "The People of the Long Barrow Period."
"	Civil Engineers. Photographic.
8.30 p.m.	Medical and Chirurgial.

WEDNESDAY, April 14, 3 p.m.	Literary Fund.
"	Dr. Bülrow's Last Recital (St. James's Hall).
4.15 p.m.	Royal Society of Literature.
8 p.m.	Society of Arts. Geological.
"	Archæological Association. Graphic.
"	Mr. Ransford's Ballad Concert, St. James's Hall.
THURSDAY, April 15, 3 p.m.	Royal Institution: Professor H. G. Seeley on "The Fossil Forms of Flying Animals."
6.30 p.m.	Royal Society Club.
7 p.m.	Numismatic.
"	London Institution: Dr. Freeman on "The History and Use of the English Language." III.
8 p.m.	Chemical. Papers by Mr. J. W. Thomas, Mr. G. H. Beckett, and Dr. Wright, Dr. Armstrong, Professor Maskelyne, and Dr. Flight.
"	Linnæan.
8.30 p.m.	Royal. Antiquaries.
FRIDAY, April 16, 8 p.m.	Philological: Mr. H. Nicol on "French Sounds in English." I.
9 p.m.	Royal Institution: Professor Gladstone on "The Progress of Science in Elementary Schools."

SCIENCE.

A History of English Sounds from the Earliest Period, including an Investigation of the General Laws of Sound Change, and Full Word Lists. By Henry Sweet. (London: Trübner & Co., 1874.)

THIS small treatise (163 pp. 8vo), reprinted from the Philological Society's *Transactions*, is not only the most important work in the philology of English since the appearance of Mr. A. J. Ellis's *Early English Pronunciation*, but offers several substantial contributions to Teutonic and general linguistics. The recent remarkable development of pure phonetics in this country, dating from the publication of Mr. A. M. Bell's *Visible Speech* in 1867, and still hardly intelligible to many of the older school of philologists here and abroad, is enabling those familiar with the historical linguistic science of Germany to investigate the external side of language with an exactness and by methods undreamt of by Grimm; while Mr. Ellis's unique researches, to which Mr. Sweet fully acknowledges his indebtedness, have rendered it possible to apply these methods to English with most gratifying success. By combining all known modes of enquiry, and attacking the subject at its two extremities, the ancient and the modern, Mr. Sweet has produced the first continuous history of English sounds from the time of Alfred to the present day, a period of a thousand years; and incomplete in various respects as are his investigations (which chiefly concern the vowels), the quality of his work within the limits he has found it necessary to impose on himself is such as to leave little doubt of the correctness of most of his often very precise conclusions. This being the case, and it being impossible here to give its details the careful discussion for which many of them call, our task is to a considerable extent reduced to describing the principal contents of the book, and indicating some of its more general bearings.

The most striking, and from one point of view the most important part of the work, is a list of almost all the simple English words of known native or early Scandinavian origin, with the corresponding Old and Middle English forms. This valuable collection of facts, which is the foundation of much of Mr. Sweet's theoretical investi-

gation, and which affords the means of testing his conclusions and of drawing others, occupies a third of the book, and comprises over 1,700 numbered words. These are arranged in four columns, the first giving the Old English (Anglo-Saxon) form, the second the Middle English as deduced from the present spelling, which is itself given in the third column, while the fourth gives the present sound; this column and the second are written in Mr. Sweet's simple phonetic orthography mentioned below, which is practically the same as that of Old English, and thus exhibits clearly and unmistakably the principal sound-changes our language has undergone. The arrangement of the words is based on the organic formation of the vowels and consonants, and is consequently a classification of the facts; while an alphabetical index allows any modern word to be found at once by those not familiar with the older forms. It is the first attempt to collect the phonetic facts of all the stages of a living language with that exhaustiveness first applied by Grimm to the spellings of some of the old Teutonic tongues, and we fully admit the author's claim to indulgence for imperfections; the labour involved is great, it should not be thankless. Still, we must express our regret that Mr. Sweet did not keep his MS. a little longer before having it printed; a week or two's revision and completing would have prevented several vexatious, if generally unimportant, inconsistencies and omissions. The chief defect is perhaps in the arrangement, which is based neither on the Old English nor the Middle English forms, but attempts to follow both, with a success that sometimes produces confusion; one definite period should have been made the standard, for mixed classifications only conceal the laws the facts have followed. We miss several common native words, as *geese*, *yon* (the Old English original of which latter Mr. Sweet himself discovered), and occasionally the Old English form given is not really the primitive of the later ones; *hip*, for example, clearly derives not from *hup*, but from *hype*, which is given in dictionaries, and of whose existence there can be no doubt, as it exactly corresponds to the Gothic *hup(i)-s*. But such oversights as these, due to haste, hardly affect the great value of the list, which is increased by supplemental lists of irregularities, with notes.

The text begins with a short account of the thirty-six principal vowels with their physiological nomenclature, and of the rough practical notation adopted for the benefit of those whose phonetic knowledge is elementary; this is based on the original Roman value of the letters, and is so simple that ordinary readers will have little difficulty on this score in understanding the main arguments and results, though the detailed exactness of both will be appreciated only by trained phoneticians. Then follow a classification of sound-changes and an investigation of their general laws, a subject which has previously been treated in so fragmentary a manner, and, especially as to the vowels, on such an imperfect phonetic basis, that the sketch forms a valuable and original chapter of general phonology. After a section on general alphabetics, particularly on

the early adaptations of the Roman alphabet to representing Teutonic sounds, there comes the first part of the actual history of English sounds, an account, based of course on Rask and Grimm, of the Old English vowels. The chief novelties in this are the establishment of the distinction between the open *e* and *o* from *a*, and the close *e* and *o* corresponding to Gothic *i*, *u* respectively; and the proof that *ea*, *eo* differed from *ea*, *eo* by the length of their second element, which in all four had the stress.

The Middle English chapter opens with an investigation of some puzzling phenomena of the Transition period (Semi-Saxon), the reduction of Old English *æ* and *ea* to the *a*, and of *eo* to the *e(i)*, from which they arose. Mr. Sweet's explanation of the anomalous change of *æ* into *a* is that it is a case of levelling, that is, of the abolition of useless distinctions. In different inflectional forms of the same words *æ* and *a* constantly interchanged in Old English; Transition English finally selected the most distinct sound, the *a*, and dropped the other, which was liable to be confounded with open *e*, and in a few words, as *less* from *læssa*, has actually gone into it. The remaining vowel-changes of this period are discussed in connexion with the chronologically more recent ones of the other Teutonic languages; and for the first time the phonetic phenomena, not the antiquated spellings, of the modern dialects—High German, Dutch, Icelandic, Swedish, Danish, and English—are collected, and compared with one another and with those of the older tongues. The tabulation brings out the great difference in the way in which short and long vowels have been treated, and establishes, for the vowels of the Teutonic languages at least, rarely-violated laws of change; while the examination of the quantitative changes, now become qualitative, shows that English has preserved the original shortness of many vowels generally lengthened in the cognate dialects. These results enable Mr. Sweet to properly investigate the question as to the existence in Middle English of two varieties of long *e* and long *o*, and to answer it conclusively in the affirmative, besides proving incidentally that our present spellings are, as a rule, trustworthy representations of sixteenth century pronunciation, and that this is an accurate guide to that of the fourteenth. This, again, can be deduced from that of the ninth century; an apparent exception is the class of *æ* words whose vowel corresponds to Gothic *ē*, not to Gothic *ai*, which give close *ē* instead of open, the explanation being in the fact that the Modern English forms are not descended from the West-Saxon of Alfred, but from the Mercian dialect, which preserves *ē* for original Teutonic *ā* throughout. A short account of the formation of diphthongs by the vocalisation of *g* and *w* to *i* and *u*, and of the influence of consonants on vowels, ends the section.

The chapter on the Modern period is to a great extent a rediscussion of the materials collected by Mr. Ellis, with results similar to his; the principal novelty for the sixteenth century is the discovery of the retention of the sound of Old English *y* (French *u*, German *ü*) in a few words, as *bury*, *busy* (O. E. *bebyrgan*, *bysig*). The account, how-

ever, of the present pronunciation of English brings out some quite new and very curious facts, which, as all the other statements referring to living languages, have the advantage of resting on personal observation of the spoken sounds, not on inference, however well founded. The most prominent is the diphthongisation of all long vowels; that our vowels in *name*, *home* are diphthongs is well known, but it will be news to most people that in the usual educated London pronunciation those in *feel*, *fool* are also diphthongs, not the pure Italian and German long *i* and *u*, with which they are generally still identified. The laws of quantity in the Latest Modern English are also remarkable, both as to vowels and consonants; and it is evident that we must be prepared for some considerable changes in our sounds in the next generation or two.

Of his notes on the consonants Mr. Sweet says that they are merely a stopgap. We think, however, that if he discussed any of them he was bound to discuss all; as it is, the completeness of the work is impaired by the omission of several interesting facts, which with comparatively little time and trouble could have been included. We may instance the change of *d* between vowels to *ð* (*father*, *mother*); the archaic retention of the *g* of medial *ng* (*English*, *stronger*), lost in German, and of final *m* (*bosom*, *fathom*), there changed to *n*; and the change of *s* to *z* between vowels (*busy*, *freeze*), as well as often when final (*was*, and inflectional *s*). Mr. Sweet investigates anew the sounds represented by the Old English *p* and *f*, an important element in the explanation of Grimm's law, and fortifies by a survey of their present Teutonic representatives his previous conclusion as to their being originally everywhere voiced (= *ð*, *v*). The changes of *c*, *sc*, *g* into *ch*, *sh*, *j* are also examined, though without very certain results; but the most striking fragment is a theory of the value of Old English *g* where used for the *j* (consonantal *y*) of the cognate dialects. Mr. Sweet's hypothesis is that the sound represented was the voiced palatal stopped consonant corresponding to our *y* (that is, the *j* of English transcriptions of Sanskrit); which satisfactorily explains how the two Old English *gs* were sufficiently alike for *gēr*, *geoc* to alliterate with *gifan*, *gōd*, and yet have since diverged (*year*, *yoke* opposed to *give*, *good*). After this come the word-lists; and the work terminates with a discussion of the periods of English and their nomenclature. Mr. Sweet is known to be a warm advocate of the use of the term "Old English" for "Anglo-Saxon," both on philological and general grounds, and he takes the opportunity of examining Professor March's arguments on the other side, with the result, in our opinion, of showing their entire insufficiency to warrant the conclusion drawn by that eminent scholar.

It is hardly necessary to point out what a complete contrast Mr. Sweet's treatise presents to the phonological part of the two principal grammars which include all stages of English, those of Koch and Mätzner. Admirable as these works are in many ways, their treatment of letters and sounds, considering that they have only recently appeared, is marvellously bad. The utter absence of

real phonetic knowledge, their mystic reverence for our customary spellings, and the inextricable confusion of sounds with the arbitrary visible marks used to represent them, combine to make many of their statements false or unintelligible, and to display English phonology as, in the words of Grimm, nothing but "wild lawlessness." On the contrary, when the facts are presented in any orthography which represents them consistently, nothing is more striking than the great regularity with which the sounds of what is now our literary language have developed, unimpaired by its artificial cultivation, and uninfluenced by other dialects. Exceptions there are, of course, but almost every detail comes under some law, so that given only the Old English form, we can generally tell exactly what it became in Middle English, what it is to-day. That it should have been left for Mr. Sweet to make this evident shows the little progress we have made towards a real English grammar. The cramping influence of the Latin grammars of the dark ages, an influence which a too exclusively antiquarian philology has in most points been unable to shake off, even with the help afforded by native grammars of Sanskrit, has made it difficult for most of us to realise what a real grammar is, we might say almost impossible where a modern language is concerned; so that there is some excuse for those who believe that our exceptionally highly developed language is of little educational value in comparison with Latin and Greek. If English were thoroughly studied, the ludicrousness of this objection would be obvious even to those who fail to see that the increased complexity and precision of modern thought, joined to our eminently "practical" spirit, almost necessitate a remarkable improvement in the means of expressing it; and Mr. Sweet's book is a substantial and much-wanted aid to that desirable result. Comparatively great, indeed, as is the extent to which the study of our language and literature in all their stages now prevails, it is yet, partly in consequence of the name "Anglo-Saxon" making us think that their earlier portion is foreign, very far from having assumed its proper position; its natural one, we may say, for if it were not for tradition, who would think of not making it an essential part of any education for Englishmen and Englishwomen which could be called liberal? Still, many who are hardly acquainted with Early English will find much of the book of interest, and to those who occupy themselves with our provincial dialects it will be useful in many ways; besides conveying information, it will help to substitute careful observation and recording of facts for wild guesses at etymologies, and we are glad that the English Dialect Society has secured copies for its members. The fact, too, that the splittings-up of our language into its dialects, and of these into subdialects, have taken place at various periods from the arrival here of the English till now, makes the explanations and lists of the earlier forms of our words of great service for the historical investigation of local divergencies.

To those philologists who have followed us thus far, it is needless to recommend

Mr. Sweet's work; they will have seen that it interests a far wider circle than that of the students of English merely. It is true, as he remarks, that it is but a meagre sketch of what would be a really adequate history of English sounds; it investigates but one dialect, and that only roughly in many respects, while the large and important foreign element of our vocabulary is not touched. But even not taking into account the portions on general phonology, we do not hesitate to say that if similar sketches of the principal other modern languages were in existence, the formal branch of linguistic science, on which rests that most important one relating to meaning, would be much further advanced than it is.

HENRY NICOL.

Introduction to Experimental Physics, Theoretical and Practical. Including Directions for constructing Physical Apparatus and for making Experiments. By Adolf F. Weinhold, Professor in the Royal Technical School at Chemnitz. Translated by B. Loewy, F.R.A.S. (London: Longmans & Co., 1875.)

THIS work does not belong to either of the two classes into which existing text-books on physics may be divided; for neither does it—like Ganot, Deschanel, Lardner, &c.—undertake to teach physics by presenting all the facts and experiments cut and dried; nor does it—like the far smaller class of works on physical manipulation, Kohlrausch, Pickering, &c.—give us minute methods of research and elaborate calculations of results. It does not conduct us to a house already built and stocked with everything requisite for the study of physical phenomena, but it tells us how to build the house and to fill it with the requisite appliances of the study.

The usual order of subjects is followed, the general properties of matter being first discussed. Here (p. 23) we find, for almost the first time in an English text-book, an account of the "cohesion figures" formed by the immersion of wire frames in soap solution, and directions for making the frames. A frame of twelve equal wires, representing the edges of a cube, gives after immersion a small rectangular frame in the middle, which is joined to the edges by twelve plane surfaces; a triangular frame, on the other hand, shows six films after immersion which intersect towards the middle of the frame. The author states that the films will last *several hours* if the soap solution be made in the following manner:—Ten grammes of Castile soap are to be put into 400 c.c. of cold water which has been previously boiled; it is then to be gently warmed until the soap dissolves: after standing for a few hours, the clear liquid is to be poured off, and 270 c.c. (about 335 grammes) of glycerine are to be added. The solution is then ready for use. We must take exception to the term "cohesion figures," which might be misunderstood, as Mr. Tomlinson has already given the name to those figures which are formed by one liquid on the surface of or within another for which it possesses some

attraction. The term *porosity*, which we usually apply to solids only, is applied both to liquids and gases by Professor Weinhold; he proves the porosity of liquids by mixing alcohol and water and showing that a diminution of volume takes place, and the porosity of gases by volatilizing iodine in a closed flask full of air. Diffusion is not mentioned in reference to this subject. We certainly prefer not to use the word "porosity" in connexion with the above results. A very lucid and complete description of the experiment in which a double cone appears to ascend an inclined plane will be found on p. 111, accompanied by good drawings of the cone in its various positions, and clearly pointing out the cause of the fallacious appearance. A simple arrangement for showing that the angle of incidence is equal to the angle of reflection, is described in the chapter on Light. In the account of the eye in the same chapter, it is to be regretted that no examination and dissection of the organ itself is suggested; the eyes of sheep and bullocks are easily procured, and nothing can be more instructive than the separation of the lens and various humours. The real nature of the eye can scarcely be understood from a simple description such as we find here. A very capital account of the construction of a gold-leaf electroscope is given, pp. 572-4, together with drawings to illustrate the various conditions of the expanded and collapsed leaves; somewhat further on we find some novel experiments on the effects of electrical induction on a jet of water. A long account is given of that very important instrument, the electrical condenser, and the following calculation is made to illustrate the effect of touching alternately the upper and the lower disc:—

"The process may be illustrated numerically if, for example, we suppose the distance between the two discs to be such that a given quantity of positive electricity communicated to the upper disc, which we may represent by the number 1000, can only bind $\frac{1}{20}$ of this quantity of the opposite electricity in the lower disc. Then we should have, at starting, 1000 of positive electricity in the upper disc, and $\frac{1}{20} \times 1000 = 950$ of negative electricity in the lower disc. This 950 can only bind $\frac{1}{20} \times 950 = 902.5$ of positive electricity in the upper disc, in which there is therefore $1000 - 902.5 = 97.5$ of positive electricity in the free state. This 97.5 of positive electricity is removed when the upper plate is touched, and the remaining 902.5 now binds only $\frac{1}{20} \times 902.5 = 857.375$ of negative electricity in the lower disc, so that $950 - 857.375 = 92.625$ is in the free state."

We are very much surprised to find no mention of Faraday's theory of induction, and of specific inductive capacity. The book does not contain any mathematical formulæ, and does not appear to aim at excessive accuracy—thus the magnetic declination in London is spoken of as "about 20°,"—the object appears to be rather to give a good general insight into the processes of physical manipulation, and then to connect together the results obtained into a complete body of physics. The book will be found alike useful to the student, and to the lecturer, who will obtain many hints for experiments from it. G. F. RODWELL.

SCIENCE NOTES.

ONE of those border questions in which physiology and psychology meet was brought before the French Academy on the 22nd of last month by M. Chevreul, and, though his observations relate to vision and colour, the principles elucidated bore a wide application. When two or more objects are simultaneously presented to the eye, it is often found that attention is so concentrated upon certain parts, that the effect of the whole is not perceived. In one case M. Chevreul found that for several successive days his opinion of the effect produced by a border of paper painted with rose leaves and garlands of roses at intervals, placed upon various backgrounds, including black and white, differed from those of his colleagues. On the fourth day it was discovered that, instead of seeing three distinct things, he had only seen two. His companions likewise had only seen two, but not the same two as himself.

As an illustration of this preferential vision he took to the French Academy one of the sign umbrellas, with alternate sections of red and white, sometimes hung up outside umbrella shops to indicate their trade. Standing this in full view, he first called upon those present to see the disc divided into four sections of red and of white. Then, pointing with a stick, to direct special attention to the outlines of the red stripes, he invited them to see a Maltese cross on the white ground, and then a similar cross in white upon a red ground. Citing a precept of Buffon, that it was "needful to see and see again often," in order that we should avoid the error of only seeing in part, he mentioned a curious instance from the Memoirs of St. Simon. The Duke was sent to Madrid to demand the hand of the Infanta for Louis XV., and when he first saw the Duke of Albuquerque, he appeared to him as a small, thick, and badly-made man, dressed in a deep blood-red suit, with green greasy hair hanging about his shoulders. When he turned his head, the face was seen blotched with red, the lips thick, and the nose flat. St. Simon took him for a porter, but a sudden movement showed his Order of the Golden Fleece. The question arises, Was the Duke of Albuquerque's hair really green? which, as M. Chevreul observes, is a very rare tint. In St. Simon's case he supposes that his eye was simultaneously affected by the hair and the dress, and that the red of the latter threw a complementary greenish tint on the former. Placing some hair on an orange ground, he found it appeared blueish; hair of the same colour looked violetish on a yellow ground, reddish on a green one, orange on blue, and yellowish-green on violet. On black the same hair lost colour and became whitish. A large mass of colour is seen in its absolute aspect, one colour in the centre of another colour is seen in its relative aspect, according to the law of simultaneous contrast.

In seeing, or not seeing, likenesses between different individuals, M. Chevreul says it may arise from some persons comparing only the upper portions of faces, and others only the lower parts. It seems to require careful training to attend to all the parts of a complete whole, so as to give them their relative value. We see this in operations to which the term mental is usually given, as well as in those relating to physical perception. M. Chevreul thinks that contrasts of colour are only part of a general law of correlative opposition, found in magnetism, chemistry, our sensations, &c.

M. TH. RIBOT had an explanatory paper on "Physiological Psychology in Germany" in the *Revue Scientifique* for December 12 last, from which we shall extract a few passages, as the investigations to which he refers are as little known in England as he represents them to be in France. One of the problems which he solved is to obtain a measure of sensation, so that one sensation may be compared quantitatively with another. M. Ribot cites from Fechner's *Elemente*

der Psychophysik, vol. i. pp. 74-6, three methods of experiment: the method of smallest perceptible differences; the method of true and false instances; and the method of mean errors. These are thus explained: "Suppose we have two weights, A and B, to compare. If their difference is very slight, it may not be perceived, and they may be pronounced equal. If the difference d is gradually increased, it will at last become appreciable," and the sensitiveness of the person experimented upon is estimated by the weight of d when this occurs. "The second method consists in taking two weights with a slight difference, so that an error in judgment is possible. Sometimes one and sometimes the other will be pronounced the heavier, and in comparing the results of many trials there will be a certain number of decisions true, and a certain number false. As the difference between the two weights is augmented, the number of true decisions will increase at the expense of the false ones. Taking the total cases as 100, and the number of true estimations 70, we have $\frac{70}{100}$ obtained by comparing A and B. Given then a weight a , we can try to determine the weight b , which compared with a will give the same relation $\frac{70}{100}$. The cases of undecided judgment must be equally divided between the true and the false instances."

The third method consists in taking a normal weight A, ascertained by a balance, and then trying to determine by a judgment from sensation the value of another weight B, which looks equal to A. Usually the second weight differs from the first by a quantity, a , which is small in proportion as the sensitiveness of the operator is great. The trial is repeated a great many times, and the mean results ascertained.

In experimenting on the sensation of weight, the hand is stretched upon a table, and a certain weight placed on it, the subject of the trial being blindfolded. Minute additions to the weight are then successively made, and the subject asked if any difference is felt. If not, more is added until the difference is noticed, and the trials repeated many times. By this method it is found that there is a constant relation between the original weight, and the additional weight, whatever may be the amount of the former. If, for example, for 1 gramme an additional weight of $\frac{1}{4}$ gramme is required, for one ounce it will be $\frac{1}{4}$ oz., for one pound $\frac{1}{4}$ lb., &c. The mean of a great number of experiments gives one-third as the relation between the two weights, so that "whatever pressure may be on the skin, no augmentation or diminution will be felt if it does not amount to one-third of the primitive weight."

Muscular effort in raising weights gives more easily appreciable results, and the average sensitiveness is found to be about five times as great as in the preceding cases, a difference of $\frac{1}{100}$ being noticeable. This number applies to all weights, so that 6 grammes must be added to 100 grammes, 60 to 1,000, and so on, to make the difference felt.

Sensations of temperature felt by the hand are stated to require differences of one-third to be appreciable. Trials are made with two vessels of water, plunging the same finger first in one and then in the other. Sensitiveness to light is determined by the help of a photometer, and it is stated that any given luminous excitation of the eye must be augmented by $\frac{1}{100}$ for the change to be perceptible.

In testing sensitiveness to sound, two balls of the same size, A and B, have a small tablet placed between them. They are suspended by strings of the same length, and a graduated circle marks the extent to which they are elevated before being allowed to fall upon the tablet and occasion a sound which will be proportional to the height from which they descend. Producing sounds of different intensities afforded the result that any given sound must be augmented one-third to be distinguished from the preceding one.

It becomes necessary for the utilisation of these results to determine minimum limits of sensa-

tion, and to fix zero points. With regard to weight, various parts of the skin differ in sensitiveness; the most sensitive, as the forehead, temples, eyelids, and back of the hand, can appreciate one-five-hundredth of a gramme; the palms, belly, and legs, one-twentieth of a gramme, and nails one gramme. Aubert gives us the result of a great number of researches, 0.002 gr. to 0.05 gr. as the minimum of excitation by pressure that can be felt.

According to Wundt, the minimum of muscular effort appreciable is when the rectus internal muscle of the eye is caused to contract 0.004 mm.

The minimum of perceptible sound results from letting a cork ball weighing one milligramme fall from the height of one millimetre on a plate of glass when the ear of the listener is 91 millimètres off.

The internal light of the eye, having a lasting cause in chemical processes of nutrition, or muscular motion, renders it difficult to discover the minimum of light that can be recognised. Measuring light by the intensity of its shadows, and using a screen of black velvet, Volckman found the light of the eye represented by the effect of an ordinary candle about 9 feet distant.

With regard to heat, the human skin at its normal temperature, 18° 4 C., appears capable of appreciating a change of about one-eighth of a Centigrade degree.

After supplying numerous details, for which we must refer the reader to the original paper, M. Ribot comes to the law formulated by Weber and Fechner, to express the relation between excitation and sensation, which is as follows: "the sensations increase with the logarithms, while the excitations increase as the ordinary numbers." Illustrating this, M. Ribot says:—

"We know that, for pressure, the minimum perceptible is $\frac{1}{10}$ gramme; say then, excitation of grm. $\frac{1}{10} = 1$; ten times that will be one-fifth. Under this excitation we place sensation as = 1. If we wish to make the sensation two and a half times stronger, we look at a table of logarithms, and opposite log. 2.5 we find the number 316, that indicates 316 units of excitation, or $\frac{1}{10} \times 316 = 6.3$ grm. Let us make an opposite calculation. Let the excitation be 5,000 units (or 100 grammes): how much sensation will this produce? We find the logarithm of 5,000 to be 3.698, so that a pressure of 100 grammes produces a sensation 3.698 times greater than the pressure produced by $\frac{1}{10}$ gramme."

M. Delbœuf remarks that the intensity of a sensation does not entirely depend upon that of the excitation, the first impressions of light, heat, &c., being stronger than those which succeeding impulses of the same force produce.

MR. HORNE, of the Botanic Garden, Mauritius, has been exploring the Seychelles and Mauritius for the purpose of collecting materials for Mr. Baker's forthcoming *Flora*. The screw-pines or Pandanaceae find their head-quarters in this region, but they have been very little investigated, their formidable spines rendering it exceedingly difficult to collect specimens. Mr. Horne has taken great pains to secure a good set, and has sent to Kew eight barrels filled with specimens preserved in rum. Mr. Balfour, too, who accompanied one of the transit expeditions, has been studying them on the spot, and with additional materials promised by Mr. Horne, it may be possible to monograph the genus, and determine its exact affinities with Freycinetia, with which it is usually associated.

SIR HENRY BARKLY is ever active in the cause of natural history, and his name is associated with many notable discoveries in the vegetation of Australia, Mauritius, and South Africa. He has lately sent to Kew a fine collection of Stapelias and allied plants collected by himself, we believe, in Namaqualand. The small geographical area of South African vegetable types is a fact well known to botanists; hence it is not surprising that his collection contains several new species. One of the most interesting of the new types, possibly of hybrid origin, forms a connecting link between the true Stapelias and the sec-

tion or sub-genus Orbea. The specimens are preserved in spirits and accompanied by coloured portraits of several of the species. Masson in England and Jacquin on the Continent illustrated many species of this peculiar group of plants towards the end of the last and the beginning of the present centuries; but since then little has been done with them, and much remains to be done.

M. PANCERI states that the light which the Polynoe (sea annelids) can emit comes from the nerve-threads distributed in their elytra. M. Quatrefages, in presenting his paper to the French Academy, observed that M. Panceri had previously found the light of *Phyllirhoe bucephala* was produced in the same way which he himself had noticed that certain annelids not possessing elytra, together with the Ophiurids and Noctilucae, exhibited their luminosity simultaneously with muscular contractions. In the elytra of Polynoe there were no muscles, and it might be asked whether in the other cases the light was not due to the distribution of nerves among the muscles. From this point of view the further study of Noctilucae would be particularly interesting, as nothing had hitherto been discovered in those creatures resembling muscular, or nerve-fibre. M. Panceri's researches have confirmed the conclusions to which M. Quatrefages had been led, namely, that under the term phosphorescence distinct phenomena have been comprehended which have nothing in common but the production of light. (*Comptes Rendus*, Jan. 25, 1875.)

THE nature of albumen and its congeners is illustrated by experiments of M. Schützenberger, which he described in *Comptes Rendus*, Jan. 25, 1875. When albumen is acted upon by hydrate of baryta and water at a temperature of 100° C., or in an autoclave at 140° to 150°, the latter giving the most complete results, it takes up water, and resolves itself into carbonic, oxalic, sulphurous and acetic acids, and ammonia, elements of urea, of oxamide and taurine; in tyrosine, amide acids of the fatty series, and amide acids more oxygenated and less hydrogenated.

AT the last general monthly meeting of the Royal Institution the managers reported that they had elected Mr. A. H. Garrod Fullerton Professor of Physiology.

Dr. A. BRÜLL has brought out with the fourth fasciculus of his Samaritan Targum, which contains the Book of Numbers, a first appendix comprising the variations of the Bodleian fragment of this Targum, published last May by Mr. Nutt, with an elaborate preface on the history, dogma, and literature of the Samaritans. The MS., as is to be seen in Mr. Nutt's edition, has on its margin at the beginning of various sections a few words which Dr. Brüll recognises as the beginning of prayers and hymns, to be recited on the occasion when each particular section was read in the synagogue. From the fact that the words are in the Samaritan dialect and not in Arabic, Dr. Brüll ascribes an early date to the MS.; it must have been written, he thinks, at a time when the sect still understood the Samaritan language. From other reasons, we believe with Mr. Nutt that the fragment was written in the eleventh century, or perhaps even earlier, but this can hardly be proved from Dr. Brüll's argument alone. For prayers in the Samaritan dialect are still in use at Nablús in spite of the fact that no one in the congregation, with the sole exception of the high priest, understands this dialect. The same fact, too, may to this day be observed in many Jewish and all Roman Catholic congregations. Besides, we did not find a single one of those glosses agreeing with a beginning of a Samaritan prayer, of which a large number are published; it can hardly be imagined that all the prayers of which the beginning is given, according to Dr. Brüll, on the margin of the MS., should be lost. Dr. Brüll is too hasty in correcting (p. 39) some of Mr. Nutt's

readings; the MS. has סוקן מרן (not למרן; the ל remained from the original לכון); the ה and ח also are continually interchanged in the Bodleian fragment. He expresses a wish (p. 4, note 11) that instead of the entire texts of other MS. fragments, only the variations from Walton's Polyglot should be published, and thus much time and money be saved, including in this counsel the edition now being made by Dr. Petermann from three Nabla MSS., of which Genesis appeared some time ago. Dr. Petermann however, we think, would have a right to ask his adviser why he himself is wasting time and money in bringing out a simple reprint of the Polyglot text, when it was long ago known that Dr. Petermann was preparing a critical edition from original MSS. ? It is astonishing that Dr. Brill should have made no use of the Barberini MS. at Rome, a collation of which has been made by Dr. Heidenheim.

THE third edition of Bartsch's *Chrestomathie Provençale* (Elberfeld, 1875) has just appeared, seven years after its predecessor. The work is too well and favourably known to Romanic philologists to require detailed notice; though it by no means comes up to our ideal of an elementary reading-book, it must be remembered that its defects arise to a great extent from the state of Provençal studies rather than from its author. The extensive selection of texts, with the concise account of the accident and the complete, but very bare, glossary (in French and German), will give anyone who goes through it carefully a good working acquaintance with the language, sufficient for ordinary reading, or as a foundation for acquiring a more exact knowledge of its variations at different times and places, and its relations to the sister tongues, as well as for studying the modern dialects; while it will itself furnish the general reader with a fair idea of the literature which flourished in the Middle Ages, not only in the south of France, but in the north of Spain and Italy. The present edition has been revised throughout, especially the glossary, but is otherwise little changed, if we except the innovation of its pages being cut even—a great convenience for the use of the book, which involves constant reference from one part to another.

A THIRD edition of M. Heyne's useful compendium, *Kurze Laut- und Flexionslehre der Altgermanischen Dialecte* (Paderborn: Schöningh, 1874), has lately appeared. The work is substantially the same as in the previous edition, only a few unimportant alterations having been made.

MR. C. J. GRECE has, in translating Mätzner's well-known grammar (*An English Grammar*, by Professor Maetner, translated by C. J. Grece, LL.B. (London: Murray, 1874, 3 vols.), undertaken a praiseworthy, though laborious, and, we fear, rather a thankless task. It is, indeed, difficult to see what profit anyone who is not already a good German scholar could obtain from the study of a work whose full understanding requires so wide a range of linguistic knowledge as Mätzner's Grammar does. A free translation and abridgment of Koch's rather than Mätzner's Grammar, with such alterations as would bring the work up to the present state of English philology, would certainly be of more general utility than the painfully literal translation (or rather, in many cases, transliteration) of Mätzner's ponderous work that Mr. Grece has produced. The translation is not happy in point of style; we quote a passage from vol. i. p. 73: "But with the principle, which appears so natural, to consider in the division of syllables the sensuous articulation of the word as the standard, is associated the theoretical interest to render evident the stem and the termination, and, in the compounding of words, to render the separate stems manifest." If, in spite of these defects, Mr. Grece's translation succeeds in winning over any Englishmen to the scientific study

of their own language, we shall be glad to welcome it as a genuine contribution to English philology.

MEETINGS OF SOCIETIES.

ANTHROPOLOGICAL INSTITUTE (Tuesday, March 23).

COLONEL A. LANE FOX, President, in the Chair. The President communicated a note on the chest measurement of recruits for the army, pointing out how the departure from a uniform method of measuring gave rise to unnecessary public expenditure, and often to the loss of good and sound men to the service. The method employed by Colonel Fox himself at his dépôt was explained, and a table of statistics was exhibited in illustration of his remarks. The Rev. Dunbar I. Heath, M.A., read a paper entitled "Molecules and Potential Life." The object of the author was to adduce arguments to show that there is a physical foundation for the measurement of vitality. The labours of Dr. Lionel Beale enabled us to put the amount of protoplasm or living matter in the adult human body at about 15 lb. in weight. Every vital action of every sort or kind kills a portion of that matter, and the mechanism by which its death is compensated, by the vitalisation of fresh pabulum, was anatomically and physiologically described. Hence it followed that every unit of physical action corresponds to the death of a unit of protoplasm, and a unit of vital action is at the same time exhibited. The death of protoplasm at the outside of a cell was described as diminishing the velocity and therefore the pressure of the outside dissociated atoms, the consequence of which was the deposit of the proximate principles such as fibrine, &c., and a rush of fresh pabulum inwards into the cell. Mr. G. H. Kinahan, F.G.S., contributed a paper on a prehistoric road at Duncan's Flow, Balbylbaugh, co. Antrim.

GEOLOGICAL SOCIETY (Wednesday, March 24).

J. EVANS, Esq., F.R.S., President, in the Chair. —A paper "On the Occurrence of Phosphates in the Cambrian Rocks" was read by Dr. Hicks. Contrary to the opinion of Dr. Daubeny, the author had been able to detect the presence of phosphates, sometimes in considerable proportion, in many Welsh rocks of Cambrian age. The proportion was greater in the more fossiliferous beds, and attained a maximum in those deposits which contained large trilobites, such as some of the Menevian group. At St. David's, in Pembrokeshire, the author had observed that the fertility of the land bore a direct relation to the presence of phosphates in the surface-rock. He found that in the neighbourhood of igneous dykes the proportion of phosphatic minerals was considerably diminished, and the author even suggested that in some cases the eruptive rocks might have derived their supply of phosphates from the fossiliferous strata which they traversed. Mr. Hudleston gave the results of several analyses which he had made at Dr. Hicks's request. In order to compare the proportion of phosphate of calcium in the remains of the Cambrian trilobites with that of recent crustaceans, he had examined the exoskeleton of the lobster, and had also determined the proportion of phosphorus in the entire lobster, including its soft parts. Mr. Hawkins Johnson described the microscopic structure of some of the phosphatic nodules from the top of the Bala limestone in North Wales, which were recently brought before the Society by Mr. Davies. According to Mr. Johnson they exhibit organic structure. Professor Seeley described the maxillary bone of a new Dinosaur, said doubtfully to have been obtained from Tilgate forest, and now preserved in the Woodwardian Museum at Cambridge. The species has received the name of *Priodontognathus Phillipsii*. Mr. Etheridge, jun., exhibited and described some new echinoderms,

which he had collected in Australia, and which included a new species of Desor's genus *Hemipatagus*, from the Tertiary rocks of Victoria. Some South Australian species were also noticed.

LINNEAN SOCIETY (Thursday, April 1).

DR. G. J. ALLMAN, F.R.S., President, in the Chair. On taking the chair, the President alluded in a feeling manner to the loss sustained by the Society, and personally by many of its members, in the death of its treasurer, Mr. Daniel Hanbury, F.R.S. The following papers were then read: "Notes on *Octopus vulgaris*," by Mr. W. S. Mitchell; "On the Connexion of Vegetable Organisms with Small-pox," by Dr. E. Klein, Assistant-Professor at the Laboratory of the Brown Institution.

FINE ART.

RESEARCH, DISCOVERY, AND RESTORATION IN ROME.

Rome: March 31, 1875.

Still may we report of progress in the search on classical sites, and also in the range of antiquarian discoveries at Rome. Works on the Forum have been, after long suspense, resumed; and there, near the temple of the Divus Julius, has been brought to light the remnant of a colonnade, three fluted marble shafts, probably from some more ancient edifice, with portions of brick walls at the two extremities, the whole apparently belonging to some mediæval mansion enriched with spoils of antiquity. On the Palatine Hill, and within the Colosseum, the task of excavation is more actively pursued; and in that great amphitheatre the results are becoming daily more conspicuous—the alteration in the features of the scene of ruin more and more striking. But it is the Esquiline Hill which proves the yet unexhausted mine, yielding treasure-trove more or less precious. Here, in the vicinity of the massive structure of a fortified tower which rises above the earthworks of the Servian Agger, have been lately found among the ruins of a patrician house (already mentioned by me) several miscellaneous antiquities—e. g., terra-cotta lamps with figures of deities in relief, and a good bronze statuette of a household god. Near the Arch of Gallienus, which is partly built up into one side of a church (S. Vito), has been unearthed a pedestal with mouldings of decadence style, and an inscription on its front referring to restorations, made in the fifth century, of the *macellum* of Livia, and also of the adjacent area called "Forum Esquilinum." We know that that market for flesh, fowl, and fish, named by Augustus after his Empress, was founded by him about the same time with a stately portico, dedicated as "Porticus Liviae," respecting the situation of which archaeologists still differ. The *macellum* occupied the place of a more ancient market on the Esquiline, and was inaugurated by Tiberius during the lifetime of Augustus, B.C. 7; the portico was dedicated by that Emperor himself in the year B.C. 12. The question as to the place of the latter structure may be solved more easily through the light thrown on it by this newly-discovered inscription, which perhaps justifies the inference that the portico and *macellum* were adjacent to each other; while the inscribed notice serves also to indicate the situation of the Forum on the same hill. Several antiquarians (see the German *Beschreibung*) point out the extant ruins of the Porticus Liviae in some arcades in the gardens of a convent (La Purificazione), and also in some dilapidated travertine pilasters with remnants of arches between them, built up into the front of another convent and its church, S. Lucia in Selce, both on the Esquiline height. On the same heights, near the new piazza Vittorio Emanuele (just commenced), have been brought to light the remains of a superb colonnade with fluted shafts of yellow Numidian marble (*giallo antico*), the

position of which, scattered as they are, has enabled the measurement of the whole structure to be, if not positively given, conjectured as 65 mètres. This colonnade, or rather portico, had a pavement of corresponding richness, mainly, as it seems, composed of veined alabaster, no fewer than seventy large slabs of which, all alike precious and entire, have been exhumed. At the northern extremity of this portico have been found two small chambers, one with the remnants of an encrustation of agate, which appears to have entirely covered its resplendent walls; the other with lamina of slate, retaining vestiges of ornamentation in gold leaf, alike encrusting its interior. Near the railway station which fronts the scattered ruins of the *Thermae of Diocletian*, several sculptures and household utensils, bronze and marble, have been dug up at some depth—among the former a bronze statuette (subject not easily recognisable), a marble statuette of an athlete, and the mutilated lower part of another much smaller male figure, nude, of solid silver, showing the marks of injury by fire. Together with these should be noticed a life-size marble head of an Egyptian deity, exhumed in the valley between the *Caelian* and *Viminal* hills—one among many proofs of the popularity of those Oriental superstitions, the prevalence of which under the Empire is severely satirised by *Juvenal*, and other records of which are before us among the paintings in the *lararium* of a palace discovered deep under ground, some years ago, below the southern side of the *Antonine Thermae*. The progress of change affecting all objects around us, on the plateau between the railway station and the *Praetorian camp*, and over the sloping grounds near the high-placed *S. Maria Maggiore* basilica, is one of those striking displays of the realities of transition, now picturesquely manifested, and of the rapid vanishing of the old before the new conditions, which are among the memorable things of the present period in Rome's history. Such aspects deserve to be recorded, for it may be difficult even to imagine them after further renovations of the local features and circumstances in this new Italian capital.

It is satisfactory to know that the distinguished *Chevalier Fiorelli* is now at the head of the Committee for directing public works and attending to archaeological interests in Rome, he having at last complied with the invitation from the authorities to quit Naples and establish himself here. *Signor Rosa*, whose merits and services cannot be forgotten, still continues to belong to the same Committee, from which so much is now expected. The *Roman Municipal Council*, installed on the *Capitoline Hill*, has voted, as the outlay of this current year, 3,040,000 francs for works on the *Esquiline Hill* and around the *Praetorian Camp*; also 3,000,000 more for enlarging and improving streets, for a new bridge across the *Tiber*, and for altering the course of that river, in order to guarantee this city from the danger of future inundations. We may conclude that the sum voted for the last-named purpose will be better applied towards the accomplishment of the plan generally approved of alike by statesmen and by public opinion here, and now well known to the readers of journals throughout Europe—that, namely, originated with happy suggestion by *Garibaldi*.

A fine work of sculpture, one of the noblest specimens of antique Roman portraiture, is now on view at the establishment of *Signor Castellani*—a colossal bust of *Maecenas*, grand and severe in character, with traces of thought and suffering on the worn but strongly-marked features—the age apparently about fifty, or upwards—supposed to have belonged to a statue erected in a public place at *Narni*, where this truly precious antique was found about twenty-seven years ago. From that city it passed into the possession of the *Altieri* family in Rome; and it is now hoped will be purchased by the magistracy to be placed, where it should have its proper niche among the

illustrious, in the "Hall of Philosophers" in the *Capitoline Museum*.

An interesting addition to the *Pinacotheca* of the same museum will soon be made (has already been so, in fact), consisting of a series of seven colossal figures painted in fresco on the walls of a long desolate and neglected old palace of the *Popes*, *Magliana*, a rural residence once in favour with its *Pontifical* owners, on the low ground near the right bank of the *Tiber*, about nine miles from Rome, and near a station on the railway between this city and *Civita Vecchia*. The house was built in the fifteenth century, and named after an ancient *Praedium Manlianum*, on the site of which it stands—now a most melancholy, forlorn, and ominous-looking abode. During the seasons of the chase it served as a frequented hunting lodge to his jovial Holiness *Leo X.*; and here was that worldly-minded *Pontiff* seized with his last illness, in the midst of pomps and festivities for the just-announced victory, favourable to the *Papal* cause, of the Spanish over the French forces—see the interesting account of that *Medici Pontificate* by *Ranke*. The frescoes on the walls of the deserted palace—which has long been utilised as a farm by a community of nuns, and only inhabited by labourers—are all more or less injured, and the feet of each figure, together with the lower part of the pictures severally, are quite obliterated. They represent the *Muses*, with *Apollo* as *Musagetes*, each figure distinguished by a motto in verse descriptive of the individual character, from the epigrams of *Ausonius*. The figure of *Polyhymnia* is already in the picture-gallery of the *Capitol*. The other figures, removed from their original place, are now in the studio of an artist engaged for the transfer—these latter being: *Urania*, with a distant view of *Florence* in the background (perhaps allusive to the pre-eminence of that city in astronomical science); *Thalia*, with the motto—

"Comica lasciva gaudet sermone *Thalia* ;"

Clio, who is playing on the double-flute; and *Apollo*, as leader of the *Nine*, who is seated and playing on the violin; in the background to this picture is introduced a small group of *Perseus* slaying *Medusa*, while *Pegasus* springs from the blood of the decapitated *Gorgon*. All these frescoes are ascribed to *Giovanni lo Spagna*, and there is much in their conception and sentiment which reminds us of the far superior works by that pupil of *Pietro Perugino*. The artist who suggested and superintended the transfer from the walls of the desolate old *Magliana Palace* was *Signor Mariani*, who in the modern school of sacred painting at Rome is now pre-eminently distinguished among his competitors by genuine truthfulness, poetic sentiment, and grandeur of style. I may refer especially to his large and finely conceived frescoes of the martyrdom and funeral of *St. Stephen*, on the altars of the extramural *S. Lorenzo basilica*, executed not many years ago.

Many will be interested in the project lately advanced by *Sir Vincent Eyre* (a military gentleman long resident in Rome) for restoring the tomb of *Keats* in that Protestant cemetery near the *Ostian Gate* and *Cestian pyramid*, which the poet's biographer, *Lord Houghton*, well describes as "one of the most beautiful spots on which the eye and heart of man can rest." In an appendix to a poem on sundry Roman topics, introducing the principal arguments, in honour of the illustrious poet cut off by early death, *Sir Vincent Eyre* advocates the project with just and fervent feeling. Proposing that a marble medallion of *Keats* should be placed on his modest gravestone, he states that "a new bed of violets and daisies will be planted, and carefully tended, to perpetuate the traditions of the spot; and a young stone-pine tree will be planted in the rear." The appeal, he tells us, has already been anticipated from England and America. *Miss Frere*, a relative of *Sir Bartle Frere*, has forwarded a sum, the offering of several ladies from our country; and from beyond the

Atlantic has been received a contribution from a lady who has the honour of relationship to the deceased poet. The veteran artist *Mr. Severn* (formerly *British Consul* here), the friend and in his last illness the devoted attendant of *Keats*, has in his possession at Rome an admirable mask of that highly gifted poet, "taken in England" (*Sir Vincent* informs us) "when he was in the full bloom of youth and health;" and the project now advanced by the same gentleman is that a bust, besides a portrait-relief, should be executed to perpetuate the interesting countenance of *Keats*, and to be within reach of his countless admirers. A distinguished and most estimable sculptor, well known to all the English in Rome (as indeed in his own country), *Mr. Warrington Wood*, undertakes to execute the medallion gratis; and the cost of the marble, also of the erection *in situ*, will be defrayed out of the fund formed by subscription. Offerings may be sent to *Sir Vincent Eyre*, 81 *Via Candotti*, Rome; or to *Mr. Macbean*, now *British Consul* here. It is gratifying to know that the accomplishment of this generous project will be the implied protest of Englishmen against at least our (perhaps erroneous) interpretation of the sad and self-deprecating words inscribed by poor *Keats'* desire between his name and the date of his death (February 24, 1821), on his not-forgotten tombstone: "Here lies one whose name was writ in water."

C. I. HEMANS.

THE FRENCH GALLERY.

"ARTISTS of the Continental Schools," not merely French artists, furnish forth this exhibition at 120 *Pall-Mall*, the twenty-second of the series. It has a general air of liveliness, efficiency, and attraction, and contrasts very favourably with some of the gatherings of recent years. We shall, on the present occasion, mention a few of the pictures according to the nationality of the painters, reserving others for a future occasion.

French Painters.—*M. Gérôme* sends a work of considerable importance, *La Danse du Sabre*: a fact which of itself would suffice to make the collection a not undistinguished one. In point of colour, this picture is painted too obviously for the English market. *Gérôme* is not a colourist, and, when he is left to himself, he employs hues of a subdued and rather dingy kind, which, if not precisely harmonious, are at any rate consentaneous and in keeping. In the present instance, as in some others of late years, he introduces several bright tints—variegated, but neither rich nor beautiful, nor pleasing in the general impression: the casement of painted glass, for example, is not successful, nor the bright-green gauze which envelopes the female dancer's face, above which the sabre is so precariously yet so securely balanced. Another rather failing point is the face of the piper seen in profile. The figures are numerous: one of the most effective in itself, and in the character which it gives to the composition as a whole, being the well-behaved Arabian baboon, seated on his haunches on a rug in the foreground, with yellow fur and black face, and watching the dance with a semi-civilised, semi-brutal air which emphasises the key-note of the work. The master of the house, with a green-turbaned head, has a harsh, rather haggard visage; he unbends for the moment, but with a joyless and unenlivening air. Among the most masterly pieces of design in the work we may name the glancing and tinkling tippet of gold discs or coins which covers the dancer's breast, and sways in and out to her consummately skilful motions; also the female musician who thrusts her tambourine forward as she plays, with a thoroughly easy and natural action. A clear white light comes through a window to the left, which, according to the perspective of the picture, is only indicated, not represented. Another conspicuous work is *The Marriage Contract*, by *J. Goupil*, the costume being of the period of the French

Revolution. This has a fair amount of skill, but is essentially a poor affair, with more of strained and pretentious posing than of real character or well-found incident. M. Bouguereau exhibits two pictures, of which the better one is named *Returning Home*—a peasant-girl whose arms are filled with wild-flowers and leafage, fitfully nibbled at by her white goat. *The Letter* is but a trifling specimen of Comte: the dexterous painting of the lady's white satin dress counts for little, but the face, no doubt, has a good deal of *esprit* in the expression. M. Billet resembles the late admirable peasant-painter Millet as closely in style as he does in name: his handling is vigorous, perhaps more directly so than that of Millet himself. *The Breton Mussel-Gatherer* and *The Young Ducklings* are capital performances of their class, and such as only an able and fully-trained artist could produce.

Italian Painters.—Campriani, Rossi, and Tapiro are three painters of exceptional skill, working in that very marked manner, so observable now in many quarters, which may be traced to the combined influence of Meissonier and of Fortuny. The delicate precision of touch, completeness of representation, and literality of aim, along with bright colour, sometimes too miscellaneous and unmitigated in hue to be harmonious, are highly noticeable in some artists of this school. The general effect is like that of seeing objects through an opera-glass: everything is minute and exact, diminished but not slurred or dwarfed, clear-cut as crystal. Such a work as that of Tapiro—*A Cobbler's Family, Rome*—might be pitted, for resolute undaunted precision, against the most determined examples of the English prae-Raphaelites, dating twenty and more years ago. There is a very good sense of design about this picture, which, spite of the unspeakably ragged trowsers of the piping boy, and tattered apron of the Cobbler, is not defaced by meanness or vulgarity: it has even something of idyllic grace, or classic under-current of suggestion. The handling, however, is too hard: it is as if Signor Tapiro had painted with diamond dust as his medium, instead of magilp or turpentine. *Feeding the Fowls*, by Campriani, with a steep flight of stone steps up which the birds are hopping or fluttering, is most picturesque and enjoyable; and *The Phenologist* of Rossi—a spare arid man of science, half enthusiast and half quack, demonstrating upon a skull to two overdressed ladies of the late eighteenth century—is a very able work, which leaves a tart impression on the eye, like that of some hardly pleasant but choice wine on the palate. It realises the idea of a decadent over-civilisation; the man of science becoming somewhat of the Cagliostro type, compounded of mystic, impostor, and intriguer, and the great ladies who dabbled in his secrets ripening for the Revolution and the guillotine. Another talented vivid Italian painting, belonging to a different subsection of style, is that of Jaccovacci—*A Nuns' Chapel, the Fête-Dieu*.

Spanish Pictures.—Here again much the same general influence as that which we have noticed in speaking of the Italian works is apparent: literality of motive, skill of handling, and minuteness of work, are carried to a high pitch. *The Conjuror*, by J. Agrassot—the costume being of about 1780, and the man of legerdemain being occupied in drawing an endless string of ribbons from his mouth—is extremely clever, but, as a whole, ugly; the expressions are true and bright, but a little hard; the colour varied and trenchant. The faces of the children are less successful than the rest, being somewhat blowzy and bloated. *Returning from Market, Seville*, by A. Liardo, is a surprising bit of almost microscopic nicety. *Behind the Scenes*, by R. Ribera, represents a female equestrian in a circus who has had an accident, and is carried off in a dead faint. There is abundance of incident and by-play in this picture, which would bear lengthy description, were one to go through it point by point: the technical ease and dexterity of touch are also eminent, but

the nature of the subject, with its tawdry stage-costumes, alien from nature and from pictorial propriety, makes it unpleasant, and well-nigh repulsive. W. M. ROSSETTI.

NOTES AND NEWS.

A COLLECTION of drawings was sold at Amsterdam on the 19th ult., by the following masters (the subjects are not given in the report of the sale):—Descamps, 1,400 fr.; Ary Scheffer, 1,025 fr.; Le Gallait, 850 fr.; N. de Keyser, 2,200 fr.; H. Leys, 1,160 fr.; H. T. Ten Kate, 1,225 fr.; J. B. Madou, 2,180 fr., and another, 1,910 fr.; D. Bles, 3,005 fr., another, 970 fr., another, 790 fr.; J. Bosboom, 1,620 fr.; J. Cats, 580 fr.; J. Israël, 1,170 fr. and 700 fr.; C. Rochussen, 930 fr.; H. Scholten, 1,040 fr.; C. Sprenger, 1,110 fr.; H. Frigt, 590 fr.; Waldorfe, 550 fr.; Wynants, 550 fr.; Baron, 460 fr.; Oalame, 400 fr.; Rembrandt, 850 fr.; A. v. Ostade, 1,350 fr., another, 825 fr., and another, 900 fr.; Van der Meer, of Delft, 1,890 fr.; a painting by Verschuur of a Stable sold for 6,000 fr.

We noticed lately as to be seen in the British Museum a terra-cotta boot, on the sole of which the hob-nails were arranged to form an *alpha* at the beginning and an *omega* at the heel. Since then we have seen, in the Castellani collection of the Museum, a small gold boot with the nails very expressively forming the word *παρου*—"walk." There was thus apparently a good deal of scope for the ancient *sutor* without his looking *ultra crepidam*.

M. DE SAINT-MARTIN, in the first instalment of an article on Troy (*Revue Archéologique*, March, pp. 164-170), contends vigorously for the impossibility of Schliemann's site—*Ilium Novum*—being that of the Homeric Troy. As yet his arguments are based only on topography; and though he does not advance anything new, it must be said that he has been very judicious in his selection from the old arguments against *Ilium Novum* and in favour of Bunarbashi. Between the two theories, we shall be compelled to believe again that Homer really was blind.

FOR the information of MM. Dumont and Rayet, the latter of whom raises the question in the new number of the *Revue Archéologique* (March, p. 172), we may state that the vase bearing the name of the artist *Gamedes*, and said to have been found at Thespiae, in Boeotia, is in the British Museum. It is a small aryballos of a brownish clay, unpainted, ribbed vertically, the ribs being interrupted half-way by a narrow horizontal band on which the inscription is incised. Heydemann had certainly read the name wrongly as *Panedes*. But it may still be doubted, even with the recurrence of the name on a vase in the Louvre from Tanagra, whether the fifth letter is correctly read as Δ. Its shape on both vases is D, which in archaic Greek corresponds rather to P. *Gameres* would be quite satisfactory as a name, and is so given in the Parliamentary Report of the British Museum for 1873, p. 16, No. 27, where this vase is described among the acquisitions of the year.

A CORRESPONDENT in Edinburgh writes to us:—"The latest picture of Sir Noel Paton, which is now on view at the gallery of Hugh Paton and Sons, Princes Street, Edinburgh, is entitled *Satan Watching the Sleep of Christ in the Wilderness of Temptation*. The picture was conceived as an early episode in the sublime epic of the Forty Days' Temptation, the more immediate object of the artist being to depict the surprise and rage of Satan at his first discomfiture by the mere man Christ Jesus, of whose indwelling divinity he was necessarily unconscious or incredulous. The scene is a wilderness of boulders and broken rocks, with jagged cliffs in mid distance and purple hills beyond, above which the first faint beams of morn are beginning to appear, while on the left the morning star still shines in the heavens. Drifting before the dawn, trailing clouds sweep across

the sky, their edges tinged with the light of the coming day, a slight haze still hanging over the landscape, which is suffused with the radiance of early morning.

"In the centre of the picture, the Prince of Darkness, a grand statuesque figure, without that repulsive appearance so often given to him by painters, is seated on a large rock, with half-closed wings. A lurid crown of flame encircles his swarthy locks, his spear placed on the ground rests on his right shoulder, and a red garment enwreaths his loins. His left hand clenched in anger presses on the knee, on the other knee the right elbow rests, the hand clasping the under part of his face, while he glares with baffled rage and surprise at the Sleeper who has defeated his wiles. In the foreground, lying on the bare rock, Christ sleeps at the feet of his tempter. The figure is after the traditional model, the drapery being felicitously disposed in robes of red and blue, while a halo surrounds the head. The hands are clasped, and on the countenance, wan and weary with fasting and mental agony, there still linger traces of the conflict through which He is passing, and which seems from the troubled repose to be repeated in His dreams. The face of Christ is a study in itself. The picture is well composed, the drawing masterly, the figure of Satan especially being boldly delineated and admirably modelled; the colour, though in a low key, harmonious and in keeping with the subject; and the technical treatment in the artist's usual elaborate and finished manner. Alike in conception and execution, the picture is one of the finest that we have seen from the easel of the gifted painter."

FOLEY's statue of Grattan was successfully cast in bronze last week at the foundry of Messrs. Masefield. It is to be erected in Dublin.

The Globe states that the collection of casts and statues bequeathed to the nation by the late Mr. Gibson will probably be opened to the public at the Royal Academy about the middle of May.

AN EXHIBITION of the works of the distinguished Swiss painter M. Dätier is being organised at Soleure by the Swiss Société des Beaux-Arts.

THE exhibition of the works of Führich, the religious painter, at Vienna, continues to attract a large number of visitors.

It is announced that the committee appointed to decide upon the true character of the statue of St. John the Baptist, recently brought to light in the Rosselmini-Gualandi palace at Pisa, have given it as their decided opinion that it is a genuine work of Michel Angelo.

THE German papers report the death, on March 29, at Darmstadt, of the copper-plate engraver, Heinrich Felsing, whose name is well known in Germany as one of the founders and most zealous supporters of the present "Turn-System," which has acquired such widespread popularity among Germans of all classes.

THE Administration of the Fine Arts has just ordered four ceilings for the decoration of the Louvre. The first, representing "The Glory of Mary de Medicis," is to be executed by M. Carolus Duran; the second, "The Glory of French Sculpture," by M. Tony-Robert-Fleury; the third, "The Glory of Rubens and of Painting," by M. Giacomotti; the fourth, "The Glory of Jacques de Brosse and of French Architecture," by M. Jules Lefèvre.

THE death is announced of M. Casimir de Balthazar, the painter, a pupil of Paul Delaroche. His principal works were *Joan of Arc in Prison*, *Philippe de Valois* after his defeat at Crécy, and the *Death of Lara*.

AN interesting discovery has, according to the *Journal Officiel*, been made at Les Corbières, on the top of the mountain overhanging the village of Padern, of a grotto, containing, among other relics of prehistoric inhabitants, pieces of shells carefully cut into hooks, and pierced with a hole for suspension from the neck, which evidently

were the knives used in remote ages. The use of shell-implements is an almost novel fact in diluvial caves, and would seem to lead to the supposition that the vast plains of Roussillon, from Perpignan to the environs of Estagel, once formed part of the sea, and are comparatively recent deposits of the Tet and the Agly.

THE Italian sculptor Vincenzo Conzani has lately been exhibiting in Florence his fine recumbent statue of Matilda, Duchess of Tuscany. The monument to Matilda, of which this statue forms part, is a structure of pure white marble in the style made famous by Orcagna. The Duchess is represented lying dead, in her robes of state, on an altar tomb. Nothing can be more true to nature than the expression of her countenance, which reveals that wonderful beauty so often observed shortly after death. The whole figure is enveloped in admirably-composed drapery, with the exception of the delicately-formed hands, which are simply crossed upon the breast.

Signor Conzani has also recently completed several other works of great merit, among which may be mentioned a combating Amazon full of spirit and very fine in form, a relief of a figure of Charity, a figure called Sacred Music, a duplicate of a statue in the possession of the Queen, who possesses another work by the same sculptor. We are told that Signor Conzani—like his great compatriot Michel Angelo—always works upon his marbles with his own hands. They are roughly blocked out for him, but no more; all else is his own; and the result is a sentiment that is rarely found in the works of modern sculptors, many of whom never even touch their marbles with their own hands. They are completed almost entirely with the chisel, the rasp being very slightly used.

COROT has not left any work of importance, as was at first supposed, to the Louvre. Both the *Hagar* and the *Dante*, which it was thought at one time were bequeathed to the nation, appear among the five hundred pictures, studies, and drawings that are to be sold at the Hôtel Drouot early in May. It seems, however, that by virtue of some testamentary document, dating a long time back, a sketch taken in the Forum many years ago really belongs to the Louvre.

AN exhibition of the drawings and studies of Francois Millet will be opened in Paris early this month. They are mostly lent by M. Gavet, the architect, and the exhibition will be held for the benefit of Millet's family. The *Chronique* thinks it probable, however, that it will be opened gratuitously to the public on one or two days of the week.

MR. HEATH WILSON writes as follows to correct a statement made in his letter of March 1:—

"In my letter of March 1 on the opening of the tomb of Lorenzo II. de Medici, I find it stated that 'a stout iron spike projected from the bottom of the marble sarcophagus, apparently put there when Alexander was deposited.' Having written to save the post, it appears that in my haste I have not expressed myself correctly, for I have no doubt that this spike was there when Alexander was deposited, and that it was one of two, which held down the first wooden lid over Lorenzo, but was removed and probably broken up when the body of the son was placed in the sarcophagus. As that body was twisted to avoid the spike, it is manifest that it was there at the time.

"There is a wide-spread feeling of regret that the bodies were disturbed, a feeling in which every one of any sentiment must concur. It was needless, no observations of any value were made, and the destruction of the clothes and breaking up of the bodies destroyed their identity."

APPROPOS of the discussion that took place some time ago in Parliament regarding Westminster Abbey as a burying place, and the idea that was started of a cloister in which monuments might conveniently be raised to our great dead, a correspondent gives us the following details of a grand

cemetery that has been recently formed at Stagliano, close to Genoa.

"It far excels anything of the kind existing in Great Britain, whether in architectural magnificence or in its general arrangements. When I saw it last about forty thousand pounds had been expended upon it, which sum, so I was told, had been entirely repaid by the sale of the vaults, for some of which as much as fifteen hundred pounds was paid, with an engagement to spend as much again in monuments. When this superb cloister with its galleries and magnificent chapel, and its extensive burying grounds, was commenced, the School of Sculpture at Genoa was at a very low ebb. Within twenty years, by the numerous commissions for monuments, a school has been created which boasts of nearly a dozen good sculptors. In that short time more monuments have been erected than exist in Westminster Abbey, and many of them, paid for by private citizens, are as magnificent as, or more so than, the public monuments erected in our national Walhalla. The municipality has a right of veto, and admits no monument or inscription offensive to taste, and lays down rules which work efficiently as to measurement, style, and cost of every monument. Nothing can well be more satisfactory than the results. This great outlay on the magnificent cemetery of Stagliano has been made by the small community of Genoa, where some forty years ago I have seen bodies, wrapped in rags or naked, cast anyhow, without coffins, through holes in the pavement of churches, or into public cemeteries of the most infamous kind. So it was in many parts of Italy, but now all things relating to the dead are done in decency and order as a general rule."

It may be added as a hint to our timid municipalities, that this Stagliano cemetery has proved a profitable undertaking. It pays nearly cent. per cent., and this among a small population.

BESIDES the splendid Corona, of which we gave an account some time ago, two other extremely interesting specimens of early German metal work from Hildesheim Cathedral may be seen in the new court of the South Kensington Museum. One of these is a baptismal font of cast brass, in the form of a deep cup or basin with a cover supported by four kneeling figures. These four figures are supposed to be symbolical of the four rivers that issued from Paradise. They are by no means idealised in character, indeed, they are almost grotesque in style, but they bear the overturned jars by which rivers are usually signified. The ornament round the font is in high relief. It is divided by arches into four compartments, in the first of which is represented the passage of the Red Sea by the Israelites, in the second the Baptism of our Lord, in the third the Ark of the Covenant borne across the Jordan, and in the fourth the Virgin enthroned between two kneeling bishops—the arms of the see of Hildesheim. On the cover are four other reliefs, representing the blossoming of Aaron's rod, the murder of the Innocents, the woman washing her Saviour's feet, and Mercy distributing gifts to the poor. Numerous inscriptions explaining the symbolic meaning of these carvings, mystic emblems, and statuettes of the Virtues fill up the rest of the space, so that there is not the smallest portion of this remarkable work that is not richly adorned.

According to the scroll held by Wilbern, Bishop of Hildesheim, one of the kneeling bishops on either side of the Virgin before described, this font was erected by him "in honour of the Virgin, and in the hope of pardon." If this is correct, and there seems no reason for doubting it, this magnificent example of mediæval casting dates back to the latter half of the thirteenth century, probably about 1260. It has remained in Hildesheim Cathedral ever since, but has been removed from its original position in the nave to the Chapel of St. George. The cast of it at South Kensington, taken, we believe, by some electrotype process, has been executed with great care, and reproduces the original with great sharpness and fidelity. The other Hildesheim work, a bronze pillar of remarkable beauty, we hope to notice another time.

M. HÉBERT is the French artist treated of in the *Portfolio* this month, and his morbid but undoubtedly poetic picture of *La Malaria* is the one chosen to represent his style of art. M. Hébert is an artist who never looks at nature in her happy moods. There is always in his work an underlying sentiment of disease and death. None of his men and women have healthy red blood in their veins, but move about in a sad anæmic condition like ghosts on the borders of Hades, or patients at the doors of a hospital. Even his great Virgin and Child, that was recently so extolled by French critics, was after the sallow ascetic type of Byzantine art. There is no denying, however, a peculiar poetic charm in Hébert's art, and this is well seen in *La Malaria*. It attracts our regard even though as About said of it, we "feel as though we should catch fever by simply looking at it." A picture or rather several pictures, of an "Autumn Effect," done, however, with the pen, and not with the brush, by R. L. Stevenson; a review of C. C. Black's *Michelangelo Buonarroti*, by W. B. Scott, and of Ernest George's *Etchings on the Loire*, by P. G. Hamerton; together with technical notes descriptive of Paul Delaroche's processes gained from his friend and pupil Mr. Armitage; and the usual National Gallery subject, this time an etching of Gainsborough's *Watering Place*, by R. S. Chattock, make up the number.

THE Italian art-correspondent of the *Allgemeine Zeitung* has written to that journal in reference to the name of the so-called *Madonna della Rovere* of Raphael, in the possession of Dr. Peirano, of Genoa, which the Empress of Russia was anxious to purchase. According to the writer the picture—which is a variation or copy of the original *Madonna della Rovere* of the gallery of the Dukes of Alba, and was painted for the church of the Olivetani, in Nocera de' Pagani—owes its name to the oak-tree (*rovere*) against which the Virgin is leaning, and not to the family "Rovere," who are believed by Dr. Peirano to have had a magnificent gallery at Albisola, near Savona, where, as he states, he was fortunate enough to pick up this really splendid *chef-d'œuvre* from a poor cobbler of the place. The Alba picture, of which there are thirty copies or facsimiles claiming to be original, is round, and measures about three feet in diameter. It represents St. John holding out a cross towards the infant Jesus, while the Virgin, who fills the centre of the canvas, stands clearly out from the sky behind her, with the town of Nazareth on her right and the mountains on the left. In the Peirano picture, which is square, the Madonna occupies the extreme right side of the panel, and with a half-open book in her hand leans against the massive trunk of the oak, whose branches cover a third of the sky, while the town and mountains fill up the left side of the picture.

THE STAGE.

SALVINI.

A FRENCH critic, notably keen to discern the signs of the times, has ventured the opinion that for the moment comedy has had its day, and that the old time when tragic acting was seriously cared for is coming back again for a while. The success of Salvini in America and Italy; his success this very week at Drury Lane, the success of Mr. Irving for now three years at the Lyceum, and the success of Mounet Sully and of Sarah Bernhardt in Paris, justify to some extent, if they do not wholly confirm, what M. Sarcy has said. In England, however, another explanation than that of a change in the public taste may reasonably be offered. Tragedy has of late been presented to us more impressively than comedy. Not that we have more of good tragedians than of good comedians, but that tragedy is less dependent than comedy upon *ensemble* for its effect. A fine tragedian engrosses attention: he is capable of "filling the stage." A fine comedian loses much

of his charm if he is not quite equally supported, and that is why no one of the fine comedians that we have—and we have four or five, scattered over the London theatres—produces the effect that is produced at the Lyceum by Mr. Irving, and at Drury Lane by Signor Salvini. Even at the Prince of Wales's, where *ensemble* is studied much, the excellent art of Mrs. Bancroft is not seen always at its best. Mrs. Bancroft, as her last performance has proved beyond dispute, has, like Mr. Irving, the rare genius of invention; but her field is not the one in which invention tells her most surely.

Let us come to Salvini: an artist undoubtedly of great gifts and great acquisitions. He has taken the English public a little by storm—at all events that portion of it accustomed to the mild and make-belief emotions of the opera—and people have hardly been in a temper to ask themselves what he lacks, as well as what he possesses. As far as one can judge by his performance of *Othello*, he lacks quietude, reticence, self-suppression. His acting appeals at once by its strong personal display to audiences rather readily unmindful of the absence of subtle effects, and not perhaps the most competent in all the world to value at once the more delicate light and shade of the art of Legrier, Blanche Pierson, Delaporte, Sarah Bernhardt. Salvini's style is vaguely but truly enough described as "broad" and "large." He has something—and this on the best side of him—in common with Macready; something again in common with Melingue, who, if he had played *Othello* on the Boulevard, would have given him a touch of melodrama. Unlike Ristori's art, Salvini's is the art of immediate and sure appeal. It is not wholly unkind to say that Ristori might claim kinship with Ingres: Salvini with Decamps and Delacroix.

That, then, is our preparatory grumble, if rumble indeed it be: we have tried only to indicate our own sense of something wanting, below the power so easily visible; power so soon appreciated.

We turn to the pleasanter business of rendering some justice to that power, and of tracing for those who have not seen the sensation of the week some outline of that figure he presents. In vigorous form, of one only now in middle life, square-set head, comely features, extreme mobility of expression, a rich full-toned voice that can be very loud without fatigue, and low and gentle while still manly—these are Salvini's natural advantages, and these he has studiously preserved or improved. His figure seems made to realise for us *Othello*: his whole temperament, strong but not nervous, is in accord with the part. His attitudes and actions are graceful, but with a natural and seemingly studied grace, in which few of his comrades are deficient—the actor who plays Cassio has as much grace, and more youth, to aid him. He takes little play with his hands—those sure indexes of temperament and character—betrays here the delicate or sensitive organisation, and is for this reason by so much the nearer to the realisation of the popular notion of *Othello*. Apart from voice and elocution, his strength lies in the earnestness with which his face exhibits what one would call the primary and less complicated emotions. He looks at Desdemona, so lovingly, in the second act, you realise the "too much joy" of the text, for his face is aglow with happiness; and when Iago is pouring into his ear the tale that awakens jealousy, it is very jealousy that is on his face in an instant; and when, here introducing an ovation, he flings Iago to the ground in hatred for his story, all the violence that play of features can express is expressed by Salvini; and still later before Desdemona herself, his face is charged with a passionate but simple regret. So that it can be truly said that his face is of immense mobility, but its changes are rapid, and not slowly changing ones. His face presents this look at one moment, and that—a quite different one—at

another, and you are rather strangely conscious that the one expression has nothing to do with the other. It follows the other, as a second geometrical pattern follows the first suddenly in the turn of a kaleidoscope: it does not follow the other as one light follows the other, gradually brightening, gradually darkening, over the face of a landscape. Thus it has great mobility, but not that mobility so fine that you are not struck at all with its greatness because it is so delicate and subtle. In change of expression, as in change of voice, Salvini appears to rely upon the effect of marked transitions. Of these he is undoubtedly a master.

He holds himself in reserve, throughout the earlier acts, though we said he had little reticence. But his own definite comprehension—the actor's first need—of what it is that he intends to do in the three hours given him for his work, and his own sense, a very just one generally, of the broad massing of light and shade, so to say, in his composition, incline him to quietness at first; and so the speech to the Senate is delivered very naturally, with no artifice whatever of rhetoric, and there is a very patient calm in his manner with Brabantio, as if Brabantio's paternal opposition were a thing to be philosophically expected and reckoned with. And thus his great effects—the outburst of violence upon Iago, the impetuous hurry with which he drags Desdemona to her alcove, and the scene of suicide—are led up to with discretion, and the performance from beginning to end is exactly what the actor with a sure command of means has intended it to be. The suicide itself is the strongest example of purely realistic acting which we can call to mind, though its realism is not bettered by the lurid lightning and stage thunder which either Italian theatrical tradition or Signor Salvini's own choice introduces here. The speech in which occur the thrice familiar words—keynote to what follows, and true cause of the suicide—"Othello's occupation's gone," is delivered with melancholy thoughtfulness; but that passes into impatience before the final moment, and impatience into rage and bitter despair, and so we are made ready for the final moment, which is terrible when it comes, for it is a marvel of realisation and an exhibition of horrors compared with which Croizette's death in the *Sphinx* is but a little thing. From the folds of his raiment Signor Salvini produces a Moorish scimitar, which, flashed before you for an instant, is put quickly to his neck, and there is a brief motion, as of hacking at firm flesh; the head goes backwards; there is a low gurgle, and the figure has rolled back, has rolled over, helpless on the floor, and the legs are drawn up in the air with horrible spasms of quivering.

From his comrades, Signor Salvini does not receive much valuable assistance. The representative of Desdemona is familiar enough with the resources of her art, but being apparently without the youth, she is also wholly without the *naïveté* of Desdemona. Cassio is gracefully played, and the goodly presence of the actor who represents him makes this character more real to us than any other, *Othello*, of course, excepted. Iago is played by an actor of intelligence, but of little force, and of no appearance to suggest Iago's mental authority. Brabantio is a parent of no particular importance, and the Doge does not suggest to us any freedom of action. He has perhaps read M. Yriarte's entertaining volume, and gathered that though the Doge was the head of the Republic, he was by no means its master.

FREDERICK WEDMORE.

WHILE Salvini has been exciting the audiences gathered at Drury Lane, the manager of the French plays at the Opéra Comique has contented himself with a very light entertainment—the production of the most recently successful pieces at the Théâtre des Variétés. It could hardly occur to anyone to describe *Les Trente Millions de Gladiateur* as a literary work of surpassing value. It

has the merit of *Le Journal pour Rire*, and a little of its freedom. What its four acts are all about it would be difficult to tell, for certainly its strength is neither in plot nor character. It is a farce in four acts, but, unlike most people's farces, it is actually amusing. And it is acted by M. Pitron's company with great spirit, vivacity, and fun. Mdlle. Wilhem represents, to the satisfaction of the audience, a fast young woman who aims at a good match. M. Monti appears as the loud American millionaire whose wealth is all-powerful in compassing his desires. M. Perrier's genial countenance—a typical face among French bourgeoisie—makes Gredane pleasant to look upon; and the remaining characters are really well sustained by M.M. James, Noblet, Lecourt, Mangin, and Mmes. Fabert, Désirée, and Jouffroy. The manager announces the early production of *Made-moiselle Duparc*, the last piece of any importance brought out at the Gymnase. It is by M. Louis Denayrouse, who it is said had the assistance of M. Dumas in the revision of his work.

David Garrick has been revived at the Haymarket. It is probably Mr. Sothorn's part—that is, the part wherein, while being always popular, he sacrifices little or nothing of art, to attain and keep the popularity. It is true there is a drunken scene, and that a drunken scene on the English stage is generally horribly abused—was abused, for instance, very recently, in *Home*—but here, in *David Garrick*, it is in its place: by it is transacted some necessary business of the play. And it is kept within due bounds, and is made by Mr. Sothorn the occasion of one really fine touch, the presence of which would excuse many more faults than the performance has: that fine touch is the momentary dropping of the simulation of drunkenness, Garrick being genuinely struck by the graces of the girl whom he has promised to disgust. In this part, Mr. Sothorn should undoubtedly be seen by those who have not seen him already, and those who have seen before may go to see him again, if only with the laudable purpose of preventing another revival of the exaggerated farce of Dundreary. But it is time, perhaps, that we saw Mr. Sothorn in a new character, and there is fortunately talk of a comedy by Mr. Westland Marston which may speedily give us this chance. *David Garrick* has one advantage over some other pieces in which Mr. Sothorn has appeared. It is not a one-part piece. There is reality and solidity about the other characters; they are not mere ghosts that come and go at his bidding. Thus the City people are fair enough types of a vulgarity a little lessened nowadays, but not yet wholly out of mind; and these people are drawn with firm outline and full colour by Messrs. Rogers, Clarke and Osborne, Mrs. Fitzwilliam, and Miss Fanny Wright. Mr. Howe gives the right dignity to the merchant who is better than his surroundings. Mr. Buckstone is Squire Chivy. The merchant's daughter, Ada Ingot, is played by Miss Minnie Walton, whose buoyant air is always welcome to audiences that gather to be jolly. Of the sentimental aspect of a character Miss Walton is not indeed naturally the most fitting representative, but she satisfies requirements which ought to be reasonable, since they are certainly moderate. The piece is put upon the stage with the care and taste usually to be noticed at the Haymarket Theatre. It will attract the public for a considerable time.

London Assurance has speedily taken the place of *Rose Michel* at the Gaiety, but it will be played for only a few nights, as *The Tempest* is in preparation. *London Assurance*, which everybody will remember as belonging to the earlier and better part of Mr. Boucicault's work, is one of those comedies which it requires very bad acting to spoil, but very good to do justice to. At the Gaiety, the acting just now is neither good nor bad; or rather, there is something of each. Mr. Maclean—often a most serviceable actor—has little of what is required for the part of Sir Harcourt

Courtly, which one has somewhat recently seen played, with the most admirable effect, by Mr. Farren, at the Vaudeville. But Mr. Maclean will never spoil a part, though he cannot always make it. For this character his physique is little suited. Mr. Cooper, again, is too experienced to fail, and Mr. Soutar is equal to the character he represents. Mr. Edward Righton, as Mr. Spanker, gives us a glimpse of new character. In individualising a part, this comedian is admirably strong. The delightful bustling comedy-part of Lady Gay Spanker is entrusted to Mrs. Gladstane, who performs it with vigour, but without charm. Practised as Mrs. Gladstane is as an actress, and capable as she doubtless is to represent characters in which we do not happen to have seen her, she is not to be accepted as the sufficient representative of this character of brilliant comedy. Miss West and Miss E. Gray lend their aid in minor parts. The piece, as we said, is to be quickly succeeded by *The Tempest*, and by the middle of May we are promised, at the Gaiety, a good French opera troupe who will familiarise us, it is to be hoped, with that music of Boieldieu and Hérold of which the English public is for the most part ridiculously ignorant.

THE production of the new little afterpiece at the Strand has been again postponed; but it was finally promised for Thursday night, too late to be noticed to-day in the columns of the weekly papers.

THE last nights of the *New Magdalen* are announced at the Charing Cross; from which it may be inferred that the public has sufficiently considered Mr. Wilkie Collins's solution of the "great social problem," or, in other words, that what is really an interesting drama, and no "solution" of any "social problem" at all, is now near to the end of its run.

A NEW comedy by Mr. Gilbert will be produced almost immediately at the St. James's Theatre.

WE hear that M. Legouvé has just finished a new comedy, but nothing is as yet arranged as to the theatre at which it will be represented.

Mlle. DELAPORTE has returned to St. Petersburg, to finish her engagement at the Théâtre Français there.

Mme. PASCA will shortly appear for a few weeks in Paris, at the Vaudeville Theatre.

WHAT is found most successful in the new *revue* at the Paris Vaudeville is the imitation of the acting at the Théâtre Français in *La Fille de Roland*. Delaunoy mimics admirably the gestures and the tone of Maubant as Charlemagne, and St. Germain reproduces, with infinite fun, the *tic* of Mounet Sully as Gérard. But this talent of successful imitation is by no means a rare thing. Nearly every theatre possesses one or two actors who, at least among their comrades, are known to exercise it.

PARISIAN curiosity has been excited during the last few days by the appearance of a Russian company, playing in Russian, at the Salle Ventadour. They played a piece called *Une Noce Russe*; and of course in all the audience there were hardly twenty persons who understood the language, and so could properly follow the talk and the meaning of the by-play. Under these circumstances detailed criticism became difficult, but it would have been more so had all the dialogue been allowed to remain. The Russians, however, wisely abridged it very much, and trusted a good deal to pantomime and ballet. As to the genuine acting it impressed critics with a sense of its naturalness. There seemed no self-consciousness. The actors did not appear at any moment to be playing parts on a stage. The company had brought many costumes and a part of the stage furniture. The costumes were reported to be very exact and very rich, though monotonous in form and colour. "C'est en somme"—writes a keen observer of this performance—"c'est en somme un spectacle

curieux et amusant: il a cela de bon, c'est qu'on n'est pas forcé de tout voir ni d'écouter avec grande attention. Il faut aller là uniquement pour se donner la sensation piquante d'une civilisation autre et d'un art bien différent. On va souvent la chercher bien loin, au prix d'un voyage coûteux et fatigant; on doit être trop heureux qu'elle vienne vous trouver."

JULES CLARETIE's comedy at the Théâtre de Cluny is finally pronounced to be a *succès d'estime*, neither proving that the excellent critic will be a successful dramatist, nor proving that he is wholly without the gifts required for creative work. He is a keen judge and a man of taste. It remains to be seen whether he is also a man of really original power.

MUSIC.

RAFF'S SYMPHONIES.

1. "*An das Vaterland*," eine Preis-Symphonie in fünf Abtheilungen, für das grosse Orchester. Von Joachim Raff. Op. 96. (Leipzig: J. Schuberth & Co.)
2. *Symphonie* (No. 2, *O dur*) für grosses Orchester. Von Joachim Raff. Op. 140. (Mainz: Schott.)
3. "*Im Walde*:" *Sinfonie* (No. 3, *F dur*) für grosses Orchester. Von Joachim Raff. Op. 153. (Leipzig: F. Kistner.)
4. *Symphonie* (No. 4, *G moll*) für grosses Orchester. Von Joachim Raff. Op. 167. (Leipzig: J. Schuberth & Co.)
5. "*Lenore*." *Symphonie* (No. 5, *E dur*) für grosses Orchester. Von Joachim Raff. Op. 177. (Leipzig and Weimar: Robert Seitz.)
6. *Sinfonie* (No. 6, *D moll*) für grosses Orchester. Von Joachim Raff. Op. 189. (Berlin and Posen: Bote & Bock.)

It has long been allowed that of all the tests to which an instrumental composer can submit himself, the writing of a symphony is one of the most severe. The best proof of this is to be found in the small proportion of the large number of works of this class produced which make any real and lasting impression. The majority of new symphonies are heard once—perhaps even two or three times—and then pass away into oblivion, and are thought of no more. Again, how seldom, comparatively, is the success of a musician's "first symphony" sufficient to encourage him to write a second! The fact is that a rare combination of the highest gifts is needed to form a really great symphonic writer. Beside the individuality of idea and conception necessary to give a distinct "style" to his work, he must possess the most complete mastery over the resources of counterpoint, and the even more precious faculty of "thematic development." Of the management of an orchestra less need be said, because this is comparatively the easiest part of the composer's work; and many symphonies are to be met with the scores of which are beautifully laid out, though they may be wanting in nearly every other requisite of a truly great work.

No living composer possesses the various qualifications referred to above as needful to the symphonist in so large a measure as Joachim Raff. I have no hesitation in saying that the works now under notice are, taken as a whole, the greatest symphonies written since those of Schumann. While inferior to this composer in poetic beauty of

imagination, Raff is far his superior in all that pertains to the technique of his art. Before speaking in detail of the six symphonies with which he has enriched the repertoire of the concert-room, a few remarks on his peculiar characteristics will probably interest our readers.

Raff just (and only just) falls short of the possession of the highest genius. If we compare one of the best of his symphonies with one of Beethoven's, this will be clearly seen. In a symphony of Beethoven it is the *musical idea* which chiefly arrests attention and compels admiration. The treatment of the subjects is either a secondary matter, or is so indissolubly connected with the ideas themselves, that one cannot be detached from the other. In Raff, on the contrary, it is the masterly skill of the workmanship which produces the most forcible impression; the themes which are treated are often of subsidiary importance. The composer seems deficient in self-criticism; he sometimes appears to take the first series of notes which occurs to him, and to construct a most elaborate and interesting movement out of them, as if he were bent on disproving the old saying that "one cannot make a silk purse out of a sow ear."

Raff's melody is for the most part simply very appreciable, and sometimes "catching" to a degree that verges on the commonplace. He prefers diatonic to chromatic subjects, and frequently constructs his themes entirely on the notes of the scale, sometimes (as in the finale to the "Wald Symphony," or the opening of his sonata in *F* for piano and violin) merely on the notes of the common chord. His subjects always adapt themselves well to thematic development, and in this branch of his art Raff may be compared even with Beethoven himself. Such specimens of workmanship as the finale of the symphony in *C*, No. 2, the whole of the *G* minor symphony, or the first and last movements of that in *D* minor are truly models of form. This is not surprising when it is remembered that Raff is a self-taught man. His contrapuntal skill is at times really admirable. He has a peculiarity which I have not met with (at least to nothing like the same extent) in the works of any other symphonic writer. He frequently takes two quite distinct subjects from different parts of the same symphony, and works them together in a most ingenious way. To give one illustration of this: In his last symphony (in *D* minor) the slow movement is an amply developed funeral march. This is written in the regular march-form, and is followed, according to rule, by a trio. So far there is nothing unusual; but in the *coda*, which concludes the march, these two themes (that of the march and trio), which are totally unlike one another, are introduced simultaneously, and with the happiest effect. As to the ordinary devices of fugue, canon, and imitation, the scores are full of them. Scientific writing has been called "the salt of composition": if it be, Raff's music is certainly highly flavoured. It should in justice be added that his fugal writing is seldom, if ever, dry.

There is, however, one serious drawback to the popularity of these symphonies which

must be mentioned—they are nearly all more or less too spun out. Prolixity is Raff's easily besetting sin. Evidently gifted with the greatest fluency in composition, and able at a moment's notice to throw off any quantity of thematic development by the yard, he does not always know when he has said enough. Every one of his symphonies is very long. That in G minor is the shortest, but this is only short by comparison. All the works would have gained materially by compression. This tendency towards undue length is not peculiar to Raff; it is characteristic of by far the greater part of recent German music. The modern development of instrumental composition points less to the creation of new forms than to the enlargement of those which already exist. It may be urged that Raff and his contemporaries are only doing with respect to Beethoven what the latter did with regard to Mozart and Haydn; but there is this important difference, that Beethoven justified his extension of form by the wealth of ideas and the importance of the subject-matter, whereas modern composers too often use excessive elaboration to conceal poverty of invention. This cannot be said of Raff; still he is none the less open to the charge of too great lengthiness.

One more point remains to be noticed before saying a few words about the symphonies separately. Raff has a decided partiality for what is known as "programme music." Of the six works now under notice, four have a definite argument attached to them. Mendelssohn remarked on the subject of programme music, that after Beethoven had taken the step he did in the Pastoral Symphony, it was impossible to keep clear of it. Few musicians would condemn it *per se*; the great point that should be borne in mind is that it should be, as Beethoven himself said of his Pastoral Symphony, "mehr Ausdruck der Empfindung als Malerei"—expression of emotion, rather than painting. In Raff's symphonies we find both; and while those movements in which "expression of emotion" is attempted are frequently among their composer's most successful efforts, he fails when he essays the "painting" of the wild hunt of Hulda and Wotan in the *finale* of the "Im Walde," or the ghostly ride in the "Lenore."

The first symphony, "An das Vaterland," was written, as we learn from a note by the composer prefixed to the score, between the years 1859 and 1861. In the latter year the Gesellschaft der Musikfreunde at Vienna offered prizes for the best symphony, and Raff sent in his work, which obtained the first prize. It is, nevertheless, on the whole by no means a satisfactory composition. First and foremost, it suffers more than any that follow it from terrible prolixity. It enjoys, indeed, the somewhat doubtful distinction of being, in all probability, the longest symphony in existence, occupying an hour and a quarter in performance. The programme, which is too long to quote in full, is a most curious one. The first movement is intended to portray the German character, its reflective tendency, its mingled courage and gentleness, and its thoughtfulness. In the second movement (*scherzo*) we have the German forest, with the bray of the

huntmen's horns, and the fields with the sounds of the "Volkslied." The following *larghetto* is supposed to represent the German homestead, cheered by Love and the Muses. The fourth movement (*allegro drammatico*) is meant to illustrate the vain endeavours towards the unity of the Fatherland; while the *finale* depicts the lamentation over the distracted condition of Germany, and the hope and foreshadowing of a glorious future for her when united. A stranger and more impracticable subject for musical illustration it would probably be hard to find; nor could Raff draw much inspiration from it. Apart altogether from its preposterous length—each movement seems as if it would never come to a close—it is laboured and wanting in spontaneity to a painful extent. It conveys the idea that the composer was determined to outdo all the symphony writers who had preceded him. He certainly has done so; but the result is a monstrosity, a sort of musical "sea-serpent." The symphony contains an immense amount of clever writing, and even many charming details, but as a whole it is decidedly a failure. Had Raff written no better symphonies than this, I should certainly not have troubled the readers of the ACADEMY with any account of them. I have included this one for the sake of making my notice of the series complete.

Of a very different stamp is the symphony in C, No. 2. It is difficult to realise the fact that this work and the "An das Vaterland" are the productions of the same pen. Here we find all the best characteristics of Raff's music. The ideas, at times slightly commonplace, are always pleasing; and their treatment is masterly throughout. The opening subject of the first movement bears a curious (though doubtless accidental) resemblance to the second theme in the allegro of the overture to *Fra Diavolo*: it is somewhat wanting in dignity, but full of life and spirit, and the animation of the opening is sustained through the whole of a rather long movement. Here no programme is attempted; the hearer's attention is not distracted by trying to find out what the composer meant. It is a significant fact that while Raff so frequently writes with a definite programme, it is precisely the two symphonies in which this is wanting (the second and fourth) which must rank highest as works of art. The *andante con moto* of the present symphony is charming throughout. The treatment of the orchestra is admirable—in this respect, it may be said in passing, Raff's symphonies are models—and the melodies have a refinement which is not invariably to be found in the composer's works. A particularly fine point occurs towards the close of the movement (pp. 107–109 of the score), where the principal subject is used as a bass, and given out *ff* by the basses and trombones, against the counterpoint of the upper parts. The *scherzo* which follows is somewhat Beethovenish in tone, though without plagiarism; the trio, with its three-bar rhythms is particularly good, as well as thoroughly fresh. The *finale*, which is preceded by a rather long introduction, is from its elaborate counterpoint perhaps the finest movement of the work. The chief themes, though certainly pleasing, are, again, not remarkably fresh;

but the skill with which they are handled keeps up the attention to the last. On the whole, as already said, this second symphony must be considered one of the very best of the series.

"Im Walde"—the "Forest" symphony—is the work of Raff's which is best known, and most frequently performed, on the Continent. Nor is its popularity surprising. Though I am inclined on the whole to rank it slightly below No. 2 from a purely musical point of view, it is certainly more adapted to catch the popular ear. It is pre-eminently a "tuneful" symphony, full of melodies that one whistles or hums almost involuntarily, perhaps without recollecting whence they come. The three leading themes of the first *allegro* especially partake of this character. "Im Walde" is another programme-symphony, divided into three sections, as follows:—First section (opening movement)—In the day-time, impressions and feelings. Second section; In the twilight. 1. Reverie (*largo*); 2. Dance of Dryads (*scherzo*). Third section (*finale*)—By night. Quiet movement of night in the forest. Entry and exit of the wild hunt with Hulda and Wotan. Break of day. Of these the first and second sections are legitimate subjects for musical treatment, and the composer is successful accordingly. The first movement, though somewhat diffuse (the score occupies ninety-nine pages), is full of charm, the *largo* is of a dreamy character which well befits its subject, and the "Dance of Dryads" is light and piquant, and admirable in musical treatment. In the course of this movement the subject of the *largo* is incidentally introduced with great skill and excellent effect. Of the *finale* it is impossible to speak so highly. The "wild hunt" is very noisy, very chromatic, and terribly spun out—the *finale* extends over 138 pages. The movement is full of life and vigour; but Raff has attempted here to paint what I cannot help thinking out of the province of music, and has failed in consequence. But for the *finale* I should have ranked this symphony the highest of the six; but this movement is the weak point of the work. It is, nevertheless, written with all its composer's great technical skill, and brilliantly, though somewhat noisily instrumented.

In the fourth symphony, in G minor, is again to be found another gem. Here for the second time we find "absolute" as distinguished from "programme" music. If we liken the second symphony to a painting of great breadth of design and large outline, No. 4 may be compared to an exquisite miniature. Though, like its companions, described on the title as "für grosses Orchester," it differs from the rest of the symphonies in the absence of trombones throughout the score. The first movement is of a tender, almost plaintive character; the second subject and its continuation are especially beautiful. The thematic developments of the second part of this movement are in their composer's best style. The following *scherzo* is bustling and animated, but constructed on a very uninteresting subject—apparently the first which came into Raff's head; the theme of the trio is beautiful, but unfortunately not original,

being almost identical with the subject of Schubert's Rondo in A, Op. 107, for piano duet. The slow movement (*andante, non troppo mosso*) is a charming set of variations on a simple and beautiful theme; and the *finale*, though rather commonplace in its subjects, has so much animation, and is so interesting in treatment, that its success, if well played, would be certain. The entire work is indeed well worthy of performance.

Of the fifth symphony ("Lenore") I spoke in detail on the occasion of its recent production at the Crystal Palace (see ACADEMY, November 21, 1874). As I have nothing to add to what I then said, I will simply refer my readers to that notice, and pass on to the last of the series.

The sixth symphony, in D minor, bears the motto, "Gelebt, gestrebt, gelitten, gestorben, umworben," which may be roughly paraphrased in English as "Life and aspiration, suffering and strife, death and renown." It thus typifies the career of many an artist. In his treatment of this subject it is not always easy to follow the thread of the composer's ideas. Undoubtedly, the third movement, a funeral march, represents the "gestorben," and the brilliant and joyous *finale* is just as certainly intended to depict the "umworben." Probably also life and its aspirations are meant to be indicated by the first movement; but what in the world the light and playful *scherzo* which follows has to do with "gelitten, gestritten" I cannot conceive. Leaving this point, however, to be determined by those who are wiser than myself, a few words may be said as to the general character of the symphony. The best portion beyond dispute is the funeral march—a movement which one is almost tempted to compare for breadth and dignity with that in the "Eroica;" the rest of the work is, as regards ideas, of inferior interest. This symphony, more than most of the others, seems to have come from the head rather than the heart, and to be the product of reflection and deliberation rather than of inspiration. The workmanship of the whole, its counterpoints and developments, are wonderfully clever, often really fine; but the work after repeated readings leaves one cold—always excepting the third movement. The subject of the *scherzo*, for instance, is uninteresting, not to say positively dry; and all the artifices of counterpoint cannot compensate for lack of invention. The same may also be said, though to a less extent, of the *finale*, in which Raff lavishes all the resources of his ingenuity on a rather commonplace subject. The movement is certainly effective; but how much more effective would it not have been had the composer exercised more care in the selection of his materials.

It is of course possible that impressions derived merely from reading the scores may be modified to some extent when submitted to the test of actual hearing. In the case of the third symphony, I shall be in a position next week to say how far this is the case, as the work is announced for a first performance in London at the Philharmonic Concert on Monday evening.

EBENEZER PROUT.

THE second concert of the British Orchestral Society, which took place on the 31st ult., was in many respects a decided improvement on its predecessor. Whether the strictures which have been made in various quarters on Mr. Mount have produced any effect it is, of course, impossible to tell; but it must be said in justice to that gentleman that his conducting at the last concert was not characterised by that lethargy which on some previous occasions has produced such unpleasant results. Beethoven's great *Leonora* overture, with which the concert opened, was given with a fire and spirit which left little to desire, and the promise of this first piece was well sustained throughout the evening. The programme contained two novelties of importance. The first of these was Mr. Alfred Holmes's fourth symphony, entitled "Robin Hood," which had never before been performed in public. This work is very far superior in merit and interest to the same composer's "Jeanne d'Arc" recently produced at the Crystal Palace, and noticed on that occasion in these columns. The themes, especially of the first three movements, are very pleasing, if of no special individuality, and the instrumentation is much more moderate and tasteful than in the larger and more ambitious work. The second movement, a serenade with a prominent part for the violoncellos, is especially good. The whole symphony was very warmly received, and the composer called forward at its close. The other novelty of the concert was a scena—"Saffo"—for a soprano voice, composed expressly for the society by Signor Randegger, and sung by Mme. Lemmens-Sherrington. It is after the model set by Beethoven in his "Ah perfido," and Mendelssohn in his "Infelice," and consists of a recitative followed by a slow movement and a final allegro. The scena is in all respects worthy of its composer, the slow movement being particularly charming. The orchestration is remarkably tasteful and nowhere overloaded. Being excellently sung by Mme. Lemmens, the piece achieved a thoroughly deserved success. The other features of the concert were Maurer's Concertante in A for four violins with orchestra, a work of but little musical value save as an opportunity for the display of good soloists, and to which full justice was rendered by Messrs. Carrodus, Amor, T. Watson, and Betjemann; Mendelssohn's well-known "Rondo Brillante" in B minor for piano and orchestra, played by Mr. Arthur Wilford; the overture to *Euryanthe*, and a ballad sung by Mme. Lemmens.

OUR reporter being prevented by indisposition from attending the last Saturday Concert at the Crystal Palace, we must content ourselves with recording that the programme comprised Beethoven's symphony in C minor, Macfarren's violin concerto in G minor, played by Mr. Carrodus, the overtures to *Don Giovanni* and the *Hebrides*, and vocal music by Mme. Antoinette Sterling and Mr. Vernon Rigby.

It is expected that Signor Verdi will come to England next month, to direct a series of performances of his "Requiem" at the Royal Albert Hall.

MESSRS. NOVELLO, EWER and Co. announce a new weekly musical paper to be entitled *Concordia*, the first number of which is to appear on May 1. The list of contributors whose services have been already secured includes the names of Messrs. J. Barnby, Joseph Bennett, W. Chappell, W. H. Cummings, E. Dannreuther, Sutherland Edwards, Rev. H. R. Haweis, H. Howe, John Hullah, H. C. Lunn, G. A. Macfarren, Walter Macfarren, Ebenezer Prout, Dr. Stainer, T. L. Stille, and Dr. W. H. Stone. With such a staff as this a really valuable addition to our musical literature may reasonably be expected.

THE *Musical Times* for the present month contains an article by Mr. H. C. Lunn on "The Royal Society of Musicians," to which we direct the attention of all who may desire to know some-

thing of the operations of an institution which unostentatiously does an amount of good of which few except its members have any idea.

WE have to announce the death at Saint-Josse-ten-Noode (Brussels) of the distinguished pianist, Mme. Pleyel, in the 64th year of her age. Her maiden name was Moke; her father was a Belgian and her mother a German, and she was born at Paris on July 4, 1811. Her first teacher of the piano was M. Jacques Herz; she subsequently studied under Moscheles and Kalkbrenner. Her husband, Camille Pleyel, was the head of the firm of pianoforte manufacturers of that name. Being separated from her husband after a few years of married life, she made the tour of Europe as a virtuoso. In 1848 she was appointed Professor of the Piano at the Conservatoire at Brussels, and held the post until, some five years ago, the state of her health obliged her to resign it.

THE first part of two Farewell Recitals previous to his departure for America was given by Dr. Bülow at St. James's Hall on Wednesday afternoon. On this occasion the programme was entirely selected from the works of Chopin. No more sympathetic interpreter of the music of the gifted Polish composer could be named than Dr. Bülow, whose performance throughout was, it is almost needless to say, excellent. The second and last recital is announced for Wednesday afternoon.

MR. LAMBORN COCK, the proprietor of the copyright of most, if not all, of the compositions of the late Sterndale Bennett, has just published the first volume of what we presume is to be a complete and uniform edition of our distinguished countryman's pianoforte works. We shall defer a detailed notice of the music until the series is complete, and content ourselves for the present with saying that the present volume contains ten different works, including, among others, the three popular pieces "The Lake," "The Millstream," and "The Fountain," that it is beautifully printed, and that the external appearance of the volume, which is in octavo, is fully worthy of its contents. It is edited by the late musician's former pupil, Mr. Arthur O'Leary, one of the professors of the Royal Academy of Music.

SATURDAY, APRIL 17, 1875.

No. 154, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Aristophanes' Apology, including a Transcript from Euripides, being the Last Adventure of Balaustion. By Robert Browning. (London: Smith, Elder & Co., 1875.)

BALAUSTION, the Rhodian maiden, who had saved herself and her friends from slavery in a Sicilian town by reciting what she remembered of the *Alkestis*, came afterwards to Athens, sought out Euripides, and gave him thanks for her salvation. He, recognising in her the worthy neophyte of his own tragic mysteries, bestowed on her the autograph of *Herakles Mainomenos*, the tablets whereon were traced the rough drafts of that tragedy, and the stringed instrument by which he tuned his choric melodies. These relics having been duly placed before a portrait of Euripides, her house became the poet's temple, with Balaustion for priestess. She married Euthukles, the Phokian, and these two dwelt together as settlers in Athens. In 404 B.C. Lysander took the town and threw down the famous Long Walls. From the humbled city the two aliens fled to Rhodes, Balaustion's old home, upon the same boat that had brought them from Sicily. The din of siege and capture and dismantled ramparts is still sounding in their ears, while sunset glows upon the water, and the galley, faring south by east, cuts the foam. Then Balaustion remembers the day when the news of Euripides' death reached Athens. Euthukles, returning from the exhibition of the *Thesmophoriazuses* in the theatre, had cast off his crown, and told his wife what had been heard from Thrace. The silence of chastened grief was in the house, broken by grave converse about him they honoured and had lost. Night drew on, and while they were about to celebrate the death-feast of Euripides by a recitation of his tragedy, a din of revellers in the street was heard; the doors opened, and in came Aristophanes, flushed with Dionysian victory, attended by his Komos-crew. Such invasions of privacy, be it remarked, were concordant with Athenian custom. The mimes, actors, flute-players, and dancing-girls, shrank away from Balaustion's calm presence. But Aristophanes stayed, and face to face with the priestess of Euripides, in godlike wise and haughtily, delivered himself of many speeches on the comic art in general, and on his spite against the dead tragedian in particular. Balaustion first met the argument of the Comic King by a critique of his own work from a woman's point of view; then, being urged to defend Euripides directly, she took up and read

aloud to him the whole—absolutely the whole—of *Herakles Mainomenos*. What Sophokles had done in self-defence before his judges, she chose to do for Euripides before his vilifier. All which things she now remembers and dictates to Euthukles, her husband and her scribe, beguiling thus the sea-way between Attica and Rhodes.

Such, briefly told, is the setting which Mr. Browning has invented for one of the strongest poems he has ever written, for one of the most brilliant *tours de force* of English verse, called *Aristophanes' Apology*. A more ingenious or more felicitous framework could not be imagined; all the motives are well-chosen, probable, dramatic; nor is it possible sufficiently to praise the adroitness with which the poet has seized on every scrap of history, on every tag of antiquarian gossip, which could serve his purpose. The poem literally bursts with erudition, containing, as it does, the stuff for many dissertations on the origin and object of Greek comedy, on the causes of Athenian decay, on the proper estimate of Euripides as a tragic poet, on Greek dancing-girls, and last not least, upon the Kottabos. Yet this learning is lightly borne; it scarcely can be said to overlay the presentation of the two chief personages, or to distract attention from the subject of their long debate. The aim of the poem being really the glorification of Euripides, the moment selected for Balaustion's improvisation, when Athens has just fallen, only escaping utter ruin through a verse from the *Elektra*, is sensationally appropriate. By identifying "the man of Phokis," mentioned in Lysander's life by Plutarch, with his own Euthukles, Mr. Browning rings and rounds his whole romance within a sphere of plausibility. Euripides, abused by the Comic poet as the destroyer of his country, is now shown to have stayed the conqueror's hand; while the flute-girls, feigned by Mr. Browning to be the veritable crew of Aristophanes, pipe their best and dance their worst all through the pulling down of the Long Walls.

The use made of the advantages offered by these parallels and contrasts is superb. As a sophist and a rhetorician of poetry, Mr. Browning proves himself unrivalled, and takes rank with the best writers of historical romances. Yet students may fairly accuse him of some special pleading in favour of his friends and against his foes. It is true that Aristophanes did not bring back again the golden days of Greece; true that his comedy revealed a corruption latent in Athenian life. But neither was Euripides in any sense a saviour. Impartiality regards them both as equally destructive: Aristophanes, because he indulged animalism and praised ignorance in an age which ought to have outgrown both; Euripides, because he criticised the whole fabric of Greek thought and feeling in an age which had not yet distinguished between analysis and scepticism. Of both poets Cratinus spoke the real truth, when he lumped them together in one comic verb, *εὐριπιδαριστοφανίζειν*. What has just been said about Mr. Browning's special pleading indicates the chief fault to be found with his poem. The point of view is modern. The situation is strained. Aristophanes becomes the scape-goat of Athenian sins,

while Euripides shines forth a saint as well as sage. Balaustion, for her part, beautiful as her conception truly is, takes up a position which even Plato could not have assumed. Into her mouth Mr. Browning has put the views of the most searching and most sympathetic modern analyst. She judges Euripides, not as he appeared to his own Greeks, but as he strikes the warmest of admirers who compare his work with that of all the poets who have ever lived. No account is taken of his tiresome quibblings and long-winded repartees, his moral hair-splitting and sophistry, the shifting of his point of view about such characters as Helen. We, indeed, in the nineteenth century can overlook these blemishes, while we dwell on qualities which make him third among the sons of Attic song. But in the eyes of the Greeks they were far otherwise important. The ribaldry of Aristophanes, which seems to us disgusting, and on which Mr. Browning insists with a satire at once delicate and scathing, was not more corrosive of good breeding and high tone.

Though it seems to me that Mr. Browning has credited Balaustion with views in advance of her civilisation, he cannot be said to have violated dramatic propriety. It is just that Balaustion, saved by the rhesis of *Alkestis*, and Euthukles, saviour of Athens through *Elektra*—the very priest and priestess of Euripides—should confront their Comic adversary in this lofty strain. And, what is more, the poet of our age has obeyed a right instinct in making a woman, and such an inspired woman as Balaustion, his mouthpiece. Of women in Greece we know indeed next to nothing. But nature tells us that women, all the world over, have finer moral perceptions than men; and Balaustion, be it said in passing, is worthy to be placed beside Pompilia.

The contrast between this high-spirited woman, worshipper of Euripides the sage, wife of Euthukles her own amanuensis, who darts forth withering epigrams at need; and Aristophanes, the blustering, wine-swollen, blatant monarch of the Comic scene, who rolls into her room like Father Christmas in one of Dickens's stories, is highly entertaining. Not less picturesque is the contrast between the quiet home of Balaustion, with its oratory raised beneath the portrait of the freckle-faced poet—cool, tranquil, "sicklied o'er with the pale cast of thought"—and the flame-faced revels of the Bohemian supper party, with Aristophanes for Bacchus, and "Phaps" for Aphrodite. The whole poem, it may be said, abounds in contrasts. They detonate at every turn, indeed, like crackers, rather to the detriment of true artistic calm.

Mr. Browning has shown his mastery by painting both portraits, Balaustion and Aristophanes, with equal force. His Aristophanes is no vulgar caricature. Though the English poet hates him for his foulness, loathes him for his lies, and scorns his shabby tricks of trade and catchpenny calumnies, he does not fail to appreciate the demiurgic power, the creative energy, and the splendid imagination of the author of the *Clouds*. Aristophanes is drawn like a primeval daemon, a Titan—Typhoeus or Enceladus—at war

with some new Zeus, whom he contemns, but who is born by Fate's decree to conquer. The flash and flame and force of genius, whereby this conception of Aristophanes is sustained, overpower all criticism. It is only after laying down the book and thinking over it, that we discover what is wanting—the aerial beauty which belonged to the true Aristophanes, the delicate drollery which Plato has portrayed in the *Symposium*. Mr. Browning's Aristophanes roars and ramps, and snorts and bullies, and dominates us with subtlety of intellect and strength of lung. But where in the hundreds of lines which he pours forth can we detect the teacher of the Chorus of the *Clouds*, the singer of the *Birds* in their parabasis? He is truly finest, and most artfully depicted, in the passage which describes his feelings when the news of Euripides' death reached him in the midst of his symposium. Mr. Browning soars to a dramatic climax in this masterpiece of powerful delineation.

Meanwhile, his Euripides is far-withdrawn and shadowy, a philosophic phantom, dear to all initiated souls, the burgher of no earthly city, the believer in no gods of Greece, but the beloved of God. He speaks, at great length, in his own *Herakles*, which Balaustion, with a woman's privilege, pours down the ears of half-drunk Aristophanes. But while his Comic antagonist is so carefully displayed, like a cantharus upon the cork of an entomologist, the Tragic poet, assumed to be a far superior being, is only reflected on the mirror of Balaustion's womanly mind. Here again we find dramatic propriety of the first water. Balaustion is speaking. She cannot but presuppose the supremacy of her adopted saint.

What then, after all, is the apology of Aristophanes, which gives the title to this poem? To follow the drift of Mr. Browning in tame prose is tantamount to doing a great poet in the art of psychological analysis injustice. He has added, indeed, nothing with which a careful student of the plays of Aristophanes will not be probably familiar; and he has omitted many subtle nuances inconvenient to his general drift. But he has read, condensed, and reproduced a great part of the resonant Parabases and gorgeous rheses of the poet, and has given these an adequate English form. Shall a real man, argues Aristophanes, pot-valiant in the presence of the spiritual Balaustion—shall a real man retire to a cold study or some Salaminian sea-cave, with winds and gulls for audience, and there compose the philosophic comedy of the future? Athens herself, the while, throws all her follies before him to make mirth of, all her vice to scourge. I Aristophanes took up the craft where the Megarians left it; refined upon Telekleides; purified Hermippos; matched Epulis in elegance, Kratinos in pungency. I added an element of ethereal fancy and divine good taste. Made thus and fashioned for the Comic art, I have now my fling against the sophists who corrupt our youth with law court quibblings, against the sceptics who invade the sanctities of glad old nature-worship, against the moralists who make adultery pathetic and rags picturesque. I single out men as types of the

principles I hate, and by beplastering them with mud confer an immortality upon their names. For the licence of my art I claim prescription, custom, ancient usage. Comedy is coeval with liberty in Athens. You strangers may misconceive its meaning; but we "Rocky Ones," true Attic born, despise such squeamishness as you would foist upon us. This brings me to my real quarrel with your tragic poet. He praises Death, and I praise Life. He glorifies "the out of sight and in at mind." I make the most of what is "good and graspable." Great was Hellas when men took their pleasure in the natural world, when gods were gods above them, and heroes were remembered as more than mortal, and Marathon was fought, and the Parthenon was builded. Then came the brood of Sophists darkening the sky and robbing life of joy; and, after Aischulos, Euripides. Do you think that I, I Aristophanes, could not have written Tragedies, if I had chosen? But seeing how things went from bad to worse, I rather chose to fight. I struck out at the sophist and the demagogue. Any stick will serve to smite a cur. Therefore I did not scorn lies, if they suited my purpose. Granted that what I said of Socrates and of Euripides was self-acknowledged fiction. What then? I need not stand upon stale calumnies. Wait for next year. In my *Frag*s I'll show you Aischulos against Euripides, the good old age, for which I fight, matched with the new, before god Bacchos for a judge.

This miserable outline indicates the general drift of Aristophanes. A score of quotations had been marked to illustrate the poet's style of treatment. But these I, the reviewer, have omitted: for not a sentence in this poem is superfluous; and, wrenched from its context, each passage seems an insult to its author. What praise is greater than this? Mr. Browning is unrivalled in the art of following thought through all its windings, tracing and retracing labyrinths of sophistry and prejudice, blending the specious and the true as he conceives them, the coarse and the refined, spinning with words a closely-fitting veil of gossamer for the spirit he imprisons in his verse. Therefore no poet suffers more from the process of such villainous abbreviation as a taster for the public in a first review is bound to venture on.

Balaustion's reply shall not be made to suffer such injury at our rude hands. It is enough to say that she traverses the arguments of her antagonist, showing that his claims to prescriptive right are ill-founded, and that Comedy is not coeval with Hellenic liberty, but a fungoid growth on Attic licence; that his boasted preaching of peace and good custom has proved ineffectual; that his very ideal of life leads to sloth and sensuality; that his comic art consists of tasteless ribaldry; and that he, himself, is the worst sophist by playing false to his true self and reasoning vice into a virtue. One part of her speech may be detached from the rest. She imagines a future time and a far-distant land, where men, recovering the past of Hellas, will wonder why the burghers of Athens walked abroad with no rapiers at their sides, and why the athletes wrestled naked. Study will make them understand the fitness of these customs.

But no study will reconcile them to the incongruity, unseemliness, and shame of the *Lysistrata*. That distant land is England.

I can fancy that a reader of this last, finest, poem of Mr. Browning will ask: Why trouble us about Euripides, the dead, the excellent, the mummified in the *Poetae Scenici*? As is the case with all Mr. Browning's work, however, the subject-matter of *Aristophanes' Apology* serves as a schema for conveying something far more universal than appears upon the surface. That old quarrel between Tragedy and Comedy at Athens, which he has resuscitated, has long ago been settled. It was never so important perhaps as he would have us think; for what are poems, or poets, after all but signs and symbols of a nation's culture? The accurate scholarship and vivid local colouring which make this poem priceless to a student, will repel the general reader; and all of us may cry "Connu!" when we read the prophecy of a new Comic art which shall absorb the Tragic. But no one is really unconcerned with the strife of the spirit and the flesh, idealised humanity and life materially apprehended, which underlies the shadow-duel between Balaustion and Aristophanes, as apprehended by Mr. Browning.

J. A. SYMONDS.

Life of William, Earl of Shelburne, afterwards First Marquess of Lansdowne, with Extracts from his Papers and Correspondence. By Lord Edmond Fitzmaurice. Vol. I., 1737-1766. (London: Macmillan & Co., 1875.)

WILLIAM FITZMAURICE, the son of John, first Earl of Shelburne, was born in Dublin on May 20, 1737, and passed the first years of his life in a remote part of the south of Ireland, beneath the roof of an old grandfather. This relative appears, from the candid description given us by his grandson, not to have been one of the most estimable of beings. "My grandfather," writes Lord Shelburne, in the autobiography now for the first time published by his great-grandson, the author of this interesting memoir,

"did not want the manners of his country nor the habits of his family to make him a tyrant. He was so by nature. He was the most severe character which can be imagined, obstinate and inflexible; he had not much understanding, but strong nerves and great perseverance, and no education except what he had in the army, where he served in his youth with a good degree of reputation for personal bravery and activity."

Living with this harsh relative, the future statesman regretted the effect it had upon his mental training.

"I had no great chance of a very liberal education," he says, "no great example before me; no information in my way except what I might be able to acquire by my own observation or by chance; good breeding within my own family, which made part of the feudal system; but out of it nothing but those uncultivated, undisciplined manners, and that vulgarity which makes all Irish society so justly odious all over Europe."

At the age of sixteen the young man was entered at Christchurch; but before going up to Oxford he paid a visit to London, where his father introduced him to Lord Chesterfield and to Lord Granville.

"I saw them the same morning," he writes, "and happening to go to Lord Chesterfield's

and being much struck with his wit and brilliancy and good breeding, expected all the same in Lord Granville; but finding him quite plain and simple in his manners and something both commanding and captivating, more in his countenance and general manner than in anything he said, I was much at a loss to account for the difference of impression."

At Christchurch Lord Shelburne, then Lord Fitzmaurice, was no indolent student. He read Blackstone diligently, worked hard at the classics, Livy and Demosthenes being his favourite authors, and oddly enough in a man of his bitter sarcastic disposition showed a fondness for works on theology. On leaving the university he obtained a commission in the 20th Regiment, of which Wolfe was colonel. Though not lucky enough to be sent out to Quebec, the young man still saw something of soldiering. He served in the Rochefort expedition, and also in the British contingent which co-operated with Prince Ferdinand of Brunswick in Germany, when he was present at the battle of Minden, and took part in the night attack upon the Marquis de Castries at Kloster Kampen. On his return home he was appointed aide-de-camp to the King with the rank of colonel. In 1761 his father died, and Lord Fitzmaurice, at the age of twenty-four, became Earl of Shelburne.

Politics now engrossed his attention. Though then neither a Tory nor a Whig in the more narrow acceptation of the term, his proclivities were so far Tory as to cause him to unite his fortunes with Bute in his resistance to the Oligarchy. It was chiefly through Shelburne that the junction between Fox and Bute was effected which crushed for a time the Newcastle interest, and passed the Peace of Paris through the House of Commons by large majorities. On the formation of the Grenville Ministry Shelburne was offered the Board of Trade, which he resigned some six months afterwards. When in the November of 1763 the resolution concerning Wilkes came before the House of Lords, that "the privilege of Parliament does not extend to seditious libels," Shelburne opposed the motion, and was consequently ousted from the Royal favour. His name was struck off the list of aides-de-camp, and Lord Bute as the chief of the King's friends declined to take further notice of his *quondam* colleague. During the remainder of the Grenville administration Shelburne continued in retirement, busying himself with his estate at Bowood, and in collecting manuscripts. On the accession of Lord Rockingham to power he was again offered the Board of Trade, but declined the post. When, in the July of 1766, Pitt came into office, Shelburne was appointed Secretary of State, and with his acceptance of this high honour the present portion of the memoir concludes.

Lord Edmond Fitzmaurice's biography of his ancestor—which, when completed, will be one of the most valuable contributions to our political literature that the present century has as yet brought to light—consists entirely of fresh matter. Drawn from the State Papers, from the writings of Shelburne himself, from various family papers, and from the collections in the possession of Lord Harrowby and Lady Holland,

we have the materials for the portrait of the statesman, which, while illustrating the character of the man, give us at the same time a new reading of the events of the period. In the first chapter we meet with an unfinished autobiography of Lord Shelburne. The negotiations between Lord Bute and Fox occupy the second chapter. In the third, under the heading of the "Pious Fraud," we possess a full history of the misunderstanding which arose between Fox and Bute concerning the resignation by the former of his post as Paymaster upon receiving his promised peerage. In this chapter Shelburne satisfactorily vindicates himself from the charge of "insincerity." The fourth chapter is taken up by Shelburne's administration of the Board of Trade, and his memorandum on the division of the American colonies. In the fifth chapter we have his resignation from office, while in the sixth we learn the reasons which caused him to refuse to join the Rockingham administration. The last chapter shows us Shelburne sternly opposing the measure which lost us our American colonies, and his return to power as a member of Chatham's ministry. Thus the matter which the volume contains is full of interest; and, in spite of the somewhat severe nature of the subjects brought under discussion, is as lively and entertaining as witty criticism and biting sarcasms can make it. Valuable as is the information this biography contains, and still more promises to contain, the chief interest of the present collection lies in the unsparing frankness of the sketches of his contemporaries and predecessors which Lord Shelburne delighted in portraying. That he was proud, combative, and not given to make himself all things to all men for any end whatever, we knew; but that the pen of the statesman who was the author of the Peace of Versailles was so caustic, his views so acidulated, and his judgment so harsh and narrow, we were not aware. Throughout the book when Lord Shelburne is speaking, he hardly says a good word of anyone. From the vantage point of his own superiority he looks down upon those who were heroes in his day, and dismisses them in a line of contempt or a page of invective. His incessant abuse and fault-finding are only relieved from monotony by his amusing candour and honest hatred. In the world of politics, according to his lights, all is stale, flat and unprofitable—all its leaders vain, venal and systematically dishonest.

"The Duke of Newcastle had the appearance of a 'hubble-bubble' man, as he himself always described the Irish." Sir Robert Walpole, "though out of sight the ablest man of his time and the most capable," was "inconceivably coarse and low mannered"—a judgment which posterity will certainly not reverse. Lord Carteret, afterwards Lord Granville, was

"a fine person of commanding beauty, the best Greek scholar of the age, overflowing with wit, not so much a *discur de bons mots*, like Lord Chesterfield, as a man of true comprehension, ready wit which at once saw to the bottom, and whose imagination was joined to great natural elegance."

Lord Shelburne married the daughter of

Lord Granville, which may to a certain extent account for the favourable tone of the criticism. Mr. Pulteney, afterwards Earl of Bath, was

"the greatest House of Commons orator that had ever appeared. He had a sharp cutting wit, both in and out of the House, was an elegant scholar, avaricious in the most supreme degree, as was his father before him (his wife the same), vindictive, torn with little passions unequal and uneven, sometimes in very high and sometimes in very low spirits, and full of little enmities. Examine his long opposition, and it will be seen he never did good, nor attempted any."

The Pelhams—

"had every talent for obtaining ministry, none for governing the kingdom, except decency, integrity, and Whig principles. Their forte was cunning plausibility and cultivation of mankind; they knew all the allures of the Court; they were in the habits of administration; they had been long keeping a party together."

Lord Lyttleton was "a fine poet, a good scholar, a dull historian, an amiable man, but a miserable politician." Lord Londondown "had never showed himself an able officer;" he was "a mere pen-and-ink man." Lord Ligonier, his brother soldier, fares still worse; he was "an old woman, supported by the routine of office, and having no opinion of his own." Lord Mansfield

"was a very able advocate, but of no kind of force or elevation. . . . His eloquence was of an argumentative, metaphysical cast, and his great art always appeared to be to me to watch his opportunity to introduce a proposition unperceived when his cause was ever so bad, afterwards found a true argument upon it, of which nobody could be more capable, and then give way to his imagination, in which he was by no means wanting, nor in scholarship, particularly classical learning, thanks to Westminster. . . . Like the generality of Scotch, he had no regard to truth whatever."

Of the Great Commoner we have a full-length portrait which is worth copying:—

"Mr. Pitt was a younger brother of no great family, as I believe the founder of it was Governor Pitt, his grandfather, commonly known by the name of Diamond Pitt on account of a vast large diamond which he obtained, I know not how, in the East Indies. It is no scandal to say there was a great degree of madness in the family; one sister is now confined, another described to be so on account of a most profligate life which she led, which prevented her being admitted into any company; and I believe there was a third in the style of the second. . . . Mr. William Pitt was by all accounts a very singular character from the time he went to Eton, where he was distinguished, and must have had a very early turn of observation by his telling me that his reason for preferring private to public education was that he scarce observed a boy who was not cowed for life at Eton; that a public school might suit a boy of a turbulent forward disposition, but would not do where there was any gentleness. . . . He likewise told me that during the time he was cornet of horse there was not a military book which he did not read through. It may easily be conceived what progress an ardent mind with a dash of madness and certainly a most extraordinary imagination must have made, steadily directing his mind and time from his earliest youth, as Mr. Wilkes says, 'to the studying of words and rounding of sentences,' for he was *totus in hoc*, not appearing to have applied to any other branch of science whatever. It is remarkable that neither he nor Lord Granville could write a common letter well. Of his imagination he used

to say to himself that it was so strong that most things returned to him with stronger force the second time than the first. He was so attentive to forming his own taste that he would not look at a bad print if he could avoid it, wishing not to hazard his eye for a moment. . . . It was the fashion to say that Mr. Pitt was violent, impetuous, romantic, a despiser of money, intrigue, and patronage, ignorant of the characters of men, and one who disregarded consequences. Nothing could be less just than the whole of this, which may be judged by the leading features of his life without relying on any private testimony. He certainly was above avarice, but as to everything else he only repressed his desires and acted; he was naturally ostentatious to a degree of ridicule; profuse in his house and family beyond what any degree of prudence could warrant. . . . What took much from his character was that he was always acting, always made up and never natural, in a perpetual state of exertion, incapable of friendship or of any act which tended to it, and constantly upon the watch and never unbent. . . . He was tall in his person, and as genteel as a martyr to the gout could be, with the eye of a hawk, a little head, thin face, long aquiline nose and perfectly erect. He was very well-bred, and, preserved all the manners of the *vieille cour*, with a degree of pedantry, however, in his conversation especially when he affected levity."

But if such things are done in the green tree, what can be expected of those done in the dry? If Lord Shelburne is so candid a friend to the faults and virtues of the Great Commoner, with whom he was apparently on the best of terms, can we be surprised that he should draw, with rather more than his usual allowance of shading, the characters of Bute and Fox, with whom he had quarrelled, and whose political creed he disliked? Lord Edmond Fitzmaurice warns us that when the noble author sketches his descriptions of these his former colleagues, "he was no doubt partly under the influence of subsequent transactions;" and the warning is not unnecessary. Lord Shelburne's estimate of the character of Bute and Fox must be accepted with rather more than the customary grain of salt allowed for the prejudice and bitterness of writers when commenting upon their rivals.

We repeat in conclusion that this biography, when finished, will be a most valuable addition to our politico-historical literature. If we can judge of the volumes that have to come by the one already issued, Lord Edmond Fitzmaurice is well fitted for the task he has set before him. It is not given to every one to possess the necessary qualities which constitute both the able editor and the agreeable writer, but Lord Edmond Fitzmaurice performs his double duties not only in a happy style, but with care, good taste, and an appreciation of authorities that in these days of slipshod references is most commendable. We shall watch for his second volume with much interest.

ALEX. CHARLES EWALD.

English Portraits. By C. A. Sainte-Beuve. Selected and Translated from the "*Causeries du Lundi*." (London: Daldy, Isbister & Co., 1875.)

THE anonymous translator of this book (whose identity can, we think, be recognised without the exercise of any great literary clairvoyance) may fairly count two points

in his favour—a good intention and considerable audacity. It has been not uncommonly held that translations of purely literary works are, except as intellectual exercises for the translator, mistakes; and it is quite clear that no kind of translation is beset with such difficulties as translation of criticism. The man who attempts to represent in one language the poetry of another has a good many little helps,—he is less bound to the letter than the prose translator; the poetical styles of most languages have a good deal in common; and metre, rhythm, and the like, serve as fences to keep him from straying. Moreover, though it be true that middling poets are no poets at all (a remark, by the way, which our translator quotes from Pope as if it were that writer's property), still there is no doubt that middling verse, as verse, finds a more favourable reception, indeed is more tolerable, than middling prose as prose. To translate one of the *Causeries* worthily, an amount of labour, learning and literary ability would have to be brought to the task which would be quite capable of producing original work of the highest excellence, and which would be much better spent in the production of such work. We are sorry to say that on the present occasion, whatever may have been the case with the labour, the learning and literary ability are conspicuously absent. A writer so careless or so unskilful in word-craft that he employs the adjective "brilliant" to qualify the episode of such a life as that of Mary Stuart, is clearly unfit for the task of Englishing Sainte-Beuve, and the use of such words as "indiscriminating" and "to emoliate" is not reassuring. After these proofs of incapacity one is scarcely surprised to come across such sentences as: "She had to entice Darnley into the snare by a feigned renewal of tenderness, who was then recovering from the small-pox;" or as this: "He fears lest the last volumes would not bear marks of this." There is, moreover, an irritating affectation in the use of the word *Madam* which constantly occurs. *Madam* Sand is bad enough, and we should like to know whether this writer speaks of his friends as *Madam* Smith and *Madam* Brown. But *Madam* de Longueville is simply ridiculous.

Of the original part of the volume we cannot conscientiously speak in more favourable terms. In a very long introduction of nearly 120 pages the author gives an account of Sainte-Beuve's life and writings which might have been better done in ten. Of the life there is not much to be said; and of the writings, unless by a person competent to subject them to a finished study, there is not much worth saying when it has been once stated that Sainte-Beuve, abandoning the old lines of cut-and-dried criticism, gained for himself a great place among the newer and truer race of critics who prefer to turn on the subject the mirror of a cultivated mind, and to represent the image in artistic language. The specimens of his work which are given should be a sufficient comment on this statement.

These specimens, which the translator has selected as likely to be peculiarly interesting to English readers, give (or rather would give but for the drawbacks already men-

tioned), a fair enough notion of their author's style and manner. The translator has not, however, shown much judgment in giving the first place to the study on Mary Stuart, which is quite unworthy of its author, showing neither power of appreciation, nor grace of treatment. The essay on Chesterfield which follows is in a much happier vein, and does far more justice to that most charming writer than any English criticism with which we are acquainted. Benjamin Franklin is the subject of the next, and the treatment will give readers previously unfamiliar with Sainte-Beuve a very good idea of the critic's favourite and perhaps most successful mode of treatment, in which he addresses himself rather to the life and character than to the work of his hero or heroine. The somewhat similar dealing with Gibbon is decidedly interesting, because it shows, what is rare in Sainte-Beuve, a distinct critical fault, an actual relapse into the evil ways of elder criticism. There is, of course, nothing to justify this charge in the mere fact that Sainte-Beuve does not much like the *Decline and Fall*—that perhaps the greatest of histories, the only history that one reads again and again with constantly renewed pleasure and profit, does not inspire him with any great enthusiasm. Without instancing such cases as De Quincey and Hazlitt, whose imperfection of sympathy is equally anomalous and notorious, we may say that even in the serenest critical mind there is often here and there a twist which no amount of thought and culture will quite smooth and straighten. We do not and cannot like our respective Dr. Fells, and there is an end of it. Therefore Sainte-Beuve is quite entitled not to like Gibbon. But, unfortunately, he shows us the reason of his dislike, and this reason is critically bad. "Gibbon," he says, "is not of the order of geniuses, is not even one whose talent touches or stirs up men." And why? Because, forsooth, "a thunder-clap is never heard;" because "he has not Montesquien's breathless shout on reaching the bank;" because "he never collects things in a startling point of view." Now, independently of the very questionable character of the standard here set up, which seems to require from an historian the sensational tableaux of a melodramatist, this is exactly the old fault of first drawing up an arbitrary dogmatic rule, and then accepting or rejecting according to its application, instead of examining the subject on its own merits. We seem to hear again the old burden, "A hero ought to be white; therefore Othello is a bad play."

The two essays which stand last, the famous studies on Cowper, and on Taine's *History of English Literature*, make amends by showing their author quite at his best. In both his affectionate appreciation of mediocrity (perhaps it would be fairer to say, of something just short of supremacy) is admirably presented, and the memorable defence of Pope, and of "literature that dares to be literary," which the latter essay contains, is worthy to be read and read again by every student of letters. We sincerely hope that this book may lead many persons to study the *Causeries* in the original; we wish we were paradoxical enough to believe that this result may be

furthered by the fact that these famous essays are, in many parts of the present volume, absolutely unreadable.

GEORGE SAINTSBURY.

The History of Japan. Vol. II. (1865 to 1871) completing the Work. By Francis Ottiwell Adams, F.R.G.S., H.B.M.'s Secretary of Embassy at Berlin, formerly Chargé d'Affaires and Secretary of Legation at Yedo. (London: Henry S. King & Co., 1874.)

IF Sir Stafford Northcote be right, in the opinion he recently expressed to the Conservative working men in the city of Exeter, that "the true progress of a nation is gradual and uniform, and not by jumps and starts"—the *History of Japan*, which Mr. Adams in the present volume brings down to the year 1871, must fill the reader with melancholy forebodings. It is the history of a nation long isolated from the rest of the world, which has by a rapid succession of jumps and starts traversed in a single decade as wide a circle of political and social changes as the French from the date of the Merovingian dynasty—when they too had their Mayors of the Palace, the analogue to the Japanese Shogun—or the English from the Norman Conquest to the present day. In a word, they have sought to compass in ten years that which has taken other nations as many centuries to accomplish. The magnitude of the issues—involving the destiny of a nation numbering more than thirty millions—and the novel conditions under which an experiment on this scale is being made, equally tend to invest the narrative with no ordinary interest. It opens a new chapter to the student of history, and suggests many problems not easy of solution, as to the diversity of conditions under which nations develop new forms of existence; and more or less suddenly adopt a new ideal to be striven for, as the highest good. If history has a tendency to repeat itself, the rule is one which has apparently many exceptions, and this book furnishes one of a very striking kind to add to the number.

The first part of Mr. Adams's work, already noticed in these columns,* brought the history of Japan down to the close of a well-marked period, embracing within its limits all the preliminary combinations and struggles between the confederate Daimios of the West, and the Shogun with his allied chiefs and clans. The volume now before us covers the five years which followed the downfall of the Shogun, and a marvellous succession of events constituting the actual revolution. The deposition of the reigning Shogun, the extinction of his office, and the restoration of the Mikado to power, long usurped by successive dynasties of Shoguns, formed only the first step.

The abolition of the Shogun's office was indeed the necessary prelude to measures which had for their primary object a new distribution of governing powers. But the extent to which the innovations on all established forms and institutions would be carried, and the radical character of the changes to be effected in every department, were probably

not foreseen at the time by the most revolutionary promoters of the movement which led to the Shogun's removal from the scene. Certainly nothing could be less Japanese, or more manifestly foreign, than the various moulds into which everything was ultimately cast—from the convocation of a deliberative assembly, to the redistribution and tenure of land. Nor was there any attempt to conceal or disguise the fact, however rash or hazardous it must *a priori* be assumed to have been to remodel all the social and political framework of a nation on a foreign pattern.

The French Revolution of 1789 would seem to supply a parallel in modern history. But even it fails, in some essential particulars, to furnish an exact counterpart. For the French, while making a clean sweep of all existing institutions and forms of government, included the monarchy among the things to be destroyed—and they did not set to work to reconstruct on any avowedly foreign pattern. This outward semblance therefore, with underlying differences, in a great national transformation, would furnish interesting matter for study under any circumstances. But, considered in connexion with the Eastern origin of one race, and the thoroughly Oriental type of their civilisation—so unlike in almost every respect anything existing in the Western world—the narrative becomes additionally interesting as a new experience in the progress of nations. It is in this light we are disposed to regard Mr. Adams's work, with its record of quickly succeeding events, each destined to effect a fundamental change of elements—long deemed by the Japanese themselves to be among the most permanent and vital conditions of their national existence.

The mere removal of a usurper, and the restoration of a king claiming to reign by divine right, is no novelty in history, whether ancient or modern. Such changes need not involve anything more than a palace revolution, affecting only the chief actors. But the distinguishing feature of the Japanese movement seems to have been the combination of two conflicting ideas—a restoration of sovereign power to the heir, according to ancient custom and hereditary descent, and the introduction, at the same time, of an entirely new political system of exotic origin. This, too, as if to complete the antithesis, was effected by agents whose chief influence had previously been due to an intense hatred of foreigners, and all their innovations. The *Suko*, or anti-foreign party, who raised the standard of revolt against the Shogun, took as their war-cry the expulsion of the barbarian. "Death to the foreigner" had long been inscribed on their flag. The restoration of the Mikado and downfall of the Shogunate were avowedly brought about as a means to this end.

Other objects, of course, were in view, but this was placed in the fore-front of the battle as one which united all Japanese, except the Shogun and his dependents. What new influence came into existence so suddenly and completely to reverse all the aims and principles of action; and make of the most conservative and prejudiced of the Japanese nation the chief movers in a revolution that bids fair wholly to denationalise

them? From what motives, and by what agency has this strange and unprecedented revolution been effected? An Eastern nation, obstinately attached to what was most distinctive in their nationality and customs, and inveterately hostile to whatever savoured of innovation or foreign influence—jealous, indeed, beyond all other Orientals, of European intrusion or encroachment, to be suddenly converted into ardent advocates and admirers of all Western forms and institutions, is unlike anything on record, in any other country. How is it to be explained that a revolution which had its origin in hatred of the foreigner, and for one of its principal objects his expulsion from the Japanese soil which he desecrated, became the immediate cause of friendly intercourse, the subversion of all opposing customs and institutions, and the introduction of all things foreign in their place? The fanatic patriotism of the two-sworded Samurai, ever prompting them to slay the intruder, by some unforeseen influence was suddenly turned with equal vehemence to advance the cause they had banded together to ruin. Blind instruments of destiny, they went forth to curse, and only found tongues to bless. The Daimios, under the influence of their Karos and Samurai, after complicating and endangering their immediate object by plotting at the same time for the expulsion of the Shogun and the foreigner, apparently changed their front in the midst of the conflict to make overtures of peace and amity to the Foreign Representatives. That they should have done so, and ever since thrown themselves into their arms, is explained by one word—Simonoseki! Or perhaps it should be said, in two words—Kagoshima and Simonoseki; but the lesson conveyed by both was the same, only the last was decisive. When Chosiu, the Prince of Nagato, and chief of the most turbulent and self-reliant of the Samurai, was attacked in his own territories at the straits of Simonoseki, they never doubted their triumph. But in a few hours they saw all his batteries destroyed and guns carried away, after a signal defeat inflicted by a British squadron and a battalion of marines, assisted by five vessels carrying the French and Dutch flags. The Prince and all his fighting clan then for the first time perceived their helpless inferiority in the field, and the hopelessness of success in any hostile action against the Western Powers. From that day they abandoned their former policy, and have had but one desire—to learn the secret of the European superiority and power—in peace and in war—to acquire it for their own use—to emulate them in all that gives such strength and dominion—and so in the end assert and maintain their independence. As the Mikado plainly expressed it in his letters of credence to the first ambassador he sent to Europe and America: "It is our purpose to select from the various institutions prevailing among enlightened nations, such as are best suited to our present position, and adopt them in gradual reforms and improvements of our policy and customs—so as to be upon an equality with them."

In this last sentence which we have italicised, Mr. Adams says we have the keynote of the sudden change in their policy, from rancorous hostility to friendly relations.

* ACADEMY of May 30, 1874.

Few will now be disposed, I think, to question the fact, that we have to thank the blow struck opportunely and decisively at Simonoseki, and the lesson it conveyed, for this welcome result.

The author remarks with much justice, in conclusion, that the present leaders of the nation had need beware in their future progress of two terrible enemies in the shape of vanity and conceit. They have unfortunately been accustomed to much flattery and adulation from the Americans; but their best friends are those who, while they give them full credit for their patriotism, and the courage they have shown in adopting every innovation which they believed would advance them in the path of progress, refuse to lavish indiscriminate praise. These would wish them not to be misled either by such flatteries, or their own self-conceit. They have taken a great stride in an incredibly short time—but they have not achieved “a position in the civilised world that the foremost nations of Europe took centuries to accomplish.” To claim this, and, on the strength of an assumption so fallacious, the total abolition of exterritoriality, is merely to invite failure. Before they can enter upon such a discussion with any chance of success, they have much to do, which will tax all their powers for a long time to come. What they have so far attempted under a patriotic inspiration, and with what promise of ultimate success, Mr. Adams has told us very succinctly, and with great clearness. In a notice necessarily so brief, it is difficult to do justice either to the subject or the author. We can only further observe that this second volume is in many respects an improvement on the first. Fewer despatches are quoted, and it is consequently less bulky, while the narrative gains in clearness and interest. But the same care has been taken to avoid the errors so common in superficial accounts of Japan by travellers, and to ensure perfect accuracy in dates, names, and topography, in both volumes. It will consequently form a valuable record of the stirring events which have marked the annals of this strange country during the last twenty years, long after the immediate interest now attaching to its transformation has ceased.

RUTHERFORD ALCOCK.

The Book of the Axe. A Piscatorial Description of that Stream, and Historical Sketches of all the Parishes and Remarkable Places on its Banks. With Illustrations and a Map. Fourth Edition. Re-written and Enlarged. By George P. R. Pulman. (London: Longmans & Co., 1875.)

THOUGH scarcely the book for a knapsack or carpet-bag, sketcher, angler, or tourist might do worse than digest at home *The Book of the Axe*, and then essay the actual river. Indeed, this course might be preferable to taking Mr. Pulman as an oral guide, for well-nigh 900 octavo pages descriptive of twenty miles are suggestive of a companion too gossiping to be compatible with much sport, and too inquisitive to overlook holes and corners, and grasp only the striking features of his route. Yet for a book truly “foursquare,” it were hard to find one so faithful as this monument of years of loving research, into the very notes

of which Mr. Pulman has transcribed quotations and authorities for hundreds of such terms, in connexion with land and its holding and privileges, as *soccage*, *pannage*, *liberty*, *franchise*, *surnames*, &c. &c. Against this may indeed be set a certain heedlessness of bit or bridle, which, *à propos* of the hidings of the fugitive Charles II. in Somerset, Dorset, or Devon, cannot resist going off at a tangent to Boscobel and the Penderell brothers, and not returning to the prescribed course till it has given the patient reader an exhaustive breather; nevertheless, the author's enthusiasm is always a warranty for readable matter; and given leisure and a reading-easel—for *The Book of the Axe* is one not to be stowed quickly in the head or “held readily in the hand”—it would be hard to find so companionable a book.

The author's plan is to trace the Axe, flyrod in hand, from source to mouth—a matter of twenty miles in a straight line, but of some forty or fifty in its *détours*. The reader joins him, after a delightful introductory chapter, at the stream-heads of Cheddington Copse and Axeknoller, near Beaminster, at no great distance from the sources of the Yeo, the Brit, and the Parret; and, starting thence, is carried mentally along four five-mile reaches (allowing for digressions)—the first terminating at Clapton Bridge; the second at the mouth of Perry Street Brook, near Chard Road station; the third at Abbey Bridge and the mouth of the Yarty, a mile from Axminster; and the fourth at Haven Cliff, below Axmouth. For the first half of its course the river does little more than streak a verdant landscape with a thread-like “vein of virgin silver,” here and there waxing imperceptibly as a tributary pours into it from the recess of some local “combe;” but at Winsham Bridge, about a mile from the end of the second quarter of the score, the Axe ceases to be brook-like, and—after several long and deep ranges in the Ford Abbey meadows, at Westford, near Chard Junction, or Perry Street Brook—assumes its true Axe character, “takes final leave of alder-fringed banks; and thenceforth to the sea is almost without a single encumbering bush, and flows on in a succession of alternate *stickles* and *ranges*” (*i.e.*, rough shallows or *scours* and deep smooth pools), “with high banks and shelving beaches in successive alternation also” (p. 526). As the ostensible title of the author to act the cicerone of this interesting stream-bank consists in his piscatorial prowess and achievements, it is only fair to state that he does something more than occasionally check himself in collateral gossip with a “What ho, Piscator” to an imaginary “son-of-Zebedee,” as he is fond of calling his brother of the gentle craft. No angler will deny his discipleship to Isaak Walton after perusing the casual pages in which he cheers Piscator on to landing his “pounder,” or sniffs, as by instinct, the neat and clean angler's inn-parlour. But he further exhibits a familiar knowledge of the ichthyology of the Axe in a score of pages in his introductory chapter, which enumerate and describe the salmon, salmon-trout, and varieties of trout and eel to be taken in its waters; the trout, it seems, not so good or red to cut as those of the tributary Yarty,

though of good culinary quality; and the salmon less abundant than would be the case were not the best part of the Axe, and the salmon's true spawning ground, shut out to the ascending fish by the weir at Axminster, and the Coly barred by a weir built across it half a mile from its mouth. In number, if not in goodness, they are below those of the Exe, whereof the young barrister is reported to have said to the judge who remarked that “nothing was good in extremes,” “Yes, my lord, in the Exe-streams there are the best of salmon.” Mr. Pulman has strong opinions respecting the alteration of the fence-days, knows a *fingerling* from a *graveling*, believes from observation that the sharp-nosed or silver eel is migratory, and really has adduced very fair Devonshire evidence in favour of Oppian's theory that eels are born of the slime with which their scales are covered (30-1). As to the voracity of eels he has a somewhat cannibal anecdote which may not surprise those who are aware of the greediness of the pike, and have recently read in Frank Buckland's letter to *Land and Water* of the snake-eating snakes:—

“In the summer of 1871 persons using a treading net in the Axe near Woodhayne Bridge caught an eel weighing 2½ lb. In killing it another eel weighing quite a quarter of a pound was ejected from its stomach; and, strange to say, out of the stomach came a third eel weighing a little over an ounce. The three seemed to fit something after the manner of the balls which the Chinese carve out of solid ivory size after size within each other.”

It is but natural that so assiduous a haunter of the river-bank should know something of its flora, but it might be shown by divers references to the matter of the introductory chapter that its author is a naturalist *all round*, and that, from the acquaintance he manifests with the red-marls from Axminster to Seaton, the red sandstone in the Coly and Yarty valleys, the Lias cliffs at Lyme Regis and the chalk cliffs at Seaton Bay, he might claim to be a brother of the “hammer” no less than of the special craft of the Axe; but we must not forget that his profession is to describe all the parishes and places within the “limits of deviation” of his favourite stream; no light task in so memory-haunted a district. For traces of the Celt, the Roman, and the Saxon crop up in every direction. Within twenty-five miles of Axminster are traceable no fewer than thirty cases of British and Belgic-British earthworks; and it seems abundantly clear that on the basis of the British trackways from one hill-entrenchment to another the Romans were well content to found the magnificent road system, of which in Devon and the Axe valley Icknield Street and the Fosse-way are still extant memorials. Perhaps, too, in few of their haunts of old are there so many indications of their willingness not only “stare super vias antiquas,” but also to adopt and adapt British fortresses as hereabouts. Pillesdon Pen, the twin of Lewesdon Hill, near Broadwinsor, is a strong triple-ditched British fortress, with a rectangular earthwork, betokening Roman occupation, in its centre. It is remarkably adapted for its purpose, as having within

its limits a pool fed by perennial springs; and it is an ingenious theory of Mr. Pulman that the Char, which is made up of springs rising from Pillesdon Pen and Lewesdon, may take its name from *caer*, or fortified place. Membury Castle, in shape clearly of British origin, is proved to have been adopted by the Romans by the coins of the Roman Empire which were found there, in addition to British remains, and it has a very fair claim (p. 604) to have formed Athelstan's head-quarters in the famous battle with Anlaf the Dane at *Brunenburgh*. Axminster itself—the claims of which to be identical with the last-named military position, and to represent ecclesiastically the military fortress on the river (*burn* or *brone*, *bury*=Brunenburg, see p. 598), are weighty and well-supported—was probably at first a British settlement, and, like all such of a desirable character, became in due course the basis of a Roman town. That it was not such at the first is seen in the absence of those straight broad streets which are features of Dorchester, Honiton, Bridport, and, notably among towns on the Axe, of Chard, which was doubtless Roman. Crewkerne, which has Roman features, seems to have been originally British. Axminster must have been a smaller and less important Roman settlement, which grew to greater eminence in Saxon times, and was destined in its latter day again to assert a name amid the towns of Devon, this time for peaceful prowess, and for the manufacture of carpets as famous in their way and value as the lace of Honiton. A curious account of their origin is given in p. 690. It may not be amiss to note one or two of Mr. Pulman's statistics respecting post-Roman quiescence in road-making, as far as Somerset and Devon are concerned. A Tuscan grand duke travelling from Exeter to Axminster in 1669 found the road "full of water and muddy, but not deep." A relative of Mr. Pulman recollected the first waggon which at Colyton superseded the carriage of corn on horseback. The first post-chaise astonished Taunton in 1767; and when at the end of that century the first flying coach took its three days' jog to London from Colyton or Axminster, Mr. Pulman's relative aforesaid patriotically used to book a place, but "carry his gun, walk on ahead, shoot by the roadside, and manage to have the game cooked by the time 'the Flyer' arrived at its halting-place for the night—the passengers sharing the feast and spending the evening in accordance with the custom of the time" (p. 79). When the coaching system at length came to perfection, the 170 miles were regularly accomplished in sixteen hours.

It would be impossible in the limits of an article to glance at a tithe of the historical associations of this portion of the West of England. In the reign of Elizabeth, in the wars between Charles and his Parliament, in the escape of Charles II. in Monmouth's rebellion, and in the bringing in of William III., the Axe valley had a hand, and took a part not always to its liking. Beaminster village, near the Axe-head, was well-nigh burned to the ground through a quarrel betwixt Prince Maurice's troopers and the inhabitants on Palm Sunday, 1644.

At Whitelackington, near Crewkerne, still stands a chestnut-tree under which the Duke of Monmouth and his party (among whom were the owners of Barrington Court, Ford Abbey, Colyton, Hinton St. George, all in the Axe country) were entertained during one of those progresses which were within five years exchanged for defeat and disgrace. At an old farm-house, called Cuckold's Hole, near Beer Chapel, on the border of Dorset and Devon, is a traditional hiding-place of Mr. Bragge of Sadborough, one of the fugitives after Monmouth's rebellion.

"The broad old-fashioned fireplace opened just above the clavel (or beam supporting the chimney at the entrance to the fireplace) into a still broader space, with a ledge just large enough to afford foothold for a man, and there, it is said, the fugitive, when Jeffrey's lams were after him, found temporary safety, although a roaring fire was lighted and the house was diligently searched" (p. 357).

Few of the towns in this district failed to contribute their quota to the victim list, and gibbets and gallows attested for a considerable time the steadfast Protestantism of the adherents of the son of Lucy Waters.

Passing from history to ecclesiology, there is much to arrest the explorer of the Axe in the beautiful Perpendicular church of Crewkerne, with its wonderful height of nave, its curious sacristy, wrongly supposed to have been a confessional, its porch and parvise, and "the finest west front of any parish church in England;" in the Cistercian abbey of Ford and Newenham, the first a chapter of romance in its foundation, and of history in its sometime Abbot and Devonshire worthy, Baldwin, Archbishop of Canterbury, the preacher of the Crusade, which he accompanied with *Cœur de Lion*. It is curious what a number of distinguished names connect themselves with Ford Abbey, ending with Jeremy Bentham, who, according to the housekeeper in charge while he rented it from 1815 to 1818, "did nothing, dear old man, but write, write, write from day's end to week's end." How many a self-flattering recluse, that has found out a tranquil undisturbed nook, is establishing like grounds for being thus slanderously reported! Of the most perfect Elizabethan houses on the Axe, Leigh House is said to be the chief, and of it we have a good account and engraving. At Ash Manor-house was born the great Duke of Marlborough, the son of a Churchill of so little account that the parish register of baptisms seems to oscillate between writing him down "Winston Churchill" or "Weston Churchwell." Ash is in Musbury parish, near Seaton and Axminster, and belonged early to the Devon family of Drake, into which the needy sire of the hero of Blenheim intermarried. And there are not a few other old manor-houses on the Axe banks which have given their contribution, here of more and there of less importance, to something more than county biography. We fail of space to say a word for Seaton, the watering-place of the Axe-mouth, and the growingly fashionable resort of anglers and health-seekers.

But how can it be otherwise than that much should be unnoticed, when not a legend, or a proverb, or an epitaph escapes the author as he chronicles the memorabilia

of parish after parish? Nothing is omitted, even to the local adage anent Windwhistle Hill out of which rises the Cricket Brook, and from which the English Channel on the south and the British on the north may be descried with the naked eye. "Once on a time," says the proverb, "the Devil lost his way upon Windwhistle," but it is some consolation to know that he is no longer "on the loose," being immured in a cellar at the Windwhistle Inn, into which he was trapped by a local "white witch." Such stories smack of a trading on the fears of the superstitious, very convenient in the smuggling districts of Devon and Cornwall. Smugglers are said to have used this house. We have only to add that we have scarce skimmed the cream off *The Book of the Axe*.

JAMES DAVIES.

Jules Michelet. Par Gabriel Monod. (Paris: Sandoz et Fischbacher, 1875.)

M. GABRIEL MONOD has given us, in spite of his modest disclaimer in the preface, the best of criticisms on Michelet's productions by constantly reminding the reader of the circumstances under which a writer so impressionable worked. Accuracy of detail we do not expect to find in Michelet. That which distinguishes him is the power of seizing on the important point amidst a crowd of unimportant ones, of fixing his attention upon that, and grouping everything else, real and imaginary, around it. Take, for instance, the different treatment of French Royalty in the fourteenth and fifteenth centuries by Guizot and Michelet. Guizot is always falling back upon the States-General, trying to make the most of them, and deploring their failure to turn France into a Constitutional Monarchy. Michelet knows that this could not be; that there was no France united and harmonious behind the States-General; and that, for good and for evil, the Monarchy was the voice of France. The divergence between the two men was radical. One day, as M. Monod tells us, Guizot was criticising the exuberance of the poetry of India. Michelet, who was present, burst in with "Vous ne pouvez le comprendre, vous avez toujours hai la vie."

To seek life wherever it was to be found was Michelet's principle of working. No writer has, as M. Monod points out, so habitually assigned to inanimate objects the attributes of living creatures. It is this search for life which gives its high value to his best work, the *History of France in the Middle Ages*. In those early years he laid down a canon of historical impartiality which, if it were rigorously followed out, would more than compensate for the loss of vividness caused by the abandonment of the old party style of writing. Someone had reproached him with being partial in favour of Luther:—

"On pourrait me reprocher également, répliqua-t-il, d'être partial en faveur des Vaudois, comme plus tard en faveur de Sainte Thérèse et de Saint Ignace de Loyola. C'est cependant pour l'histoire une condition indispensable que d'entrer dans toutes les doctrines, que de comprendre toutes les causes, que de se passionner pour toutes les affections. Une idée ne se produit

qu'à la condition d'être dans l'esprit humain, et d'aider au développement général de l'humanité. Aussi est-elle toujours bonne, toujours utile, toujours nécessaire. L'histoire déroule une vaste psychologie qui embrasse dans un ordre successif toutes les notions, toutes les facultés qui constituent l'intelligence de l'homme; chaque notion, chaque faculté se révèle tour à tour sous la forme d'un parti, d'une nation, d'une doctrine, et fait à travers les événements sa fortune dans le monde."

Michelet would have been less of a man than he was if he had carried out his ideas in his later works. When he published the sixth volume of his history in 1843, M. Guizot was firmly established in power. Repression was the order of the day. With short intervals a leaden weight pressed down the energies of France to the day of his death. The governments of Guizot, Napoleon, Broglie—"facies non omnibus una, nec diversa tamen"—different in many things, agreed in this: that they had no confidence in France. To Michelet, full of trust and confidence, full of tender pity, the weight was intolerable, and except when in a moment of utter despair he took refuge in poetic science, he made his history the receptacle of outpourings of his heart. Undoubtedly, as M. Monod says, his history was the worse for it. His recantation of impartiality in the preface to his *History of the Renaissance* is sad enough.

"L'homme d'action, le poète, le philosophe, l'emporé desormais sur l'historien et le critique. Au lieu d'une sympathie équitable pour toutes les grandeurs du passé, Michelet attaque avec violence tout ce qui n'est pas conforme à son idéal moderne de justice et de bonté, le moyen âge, le Catholicisme, la monarchie. Au lieu de donner à chaque événement, à chaque personnage la place proportionnée qui lui est due, il se laisse guider par les caprices de son imagination, se répand à chaque instant en des digressions poétiques."

If the history of the past loses, it may be that the France of the future will gain by it. If Michelet is often unjust, at least he is only unjust to those persons and parties from the imitators of which France has most to dread. The idolatry of Louis XIV. and the idolatry of Napoleon find no favour at his hands. Nor does he fail to see into the mischief which made Louis XIV. and Napoleon alike possible. His tragic history of the Revolution all gathers to a head in those few words with which Danton turned gloomily away from his last effort to conciliate the Girondins, "Ils n'ont pas de confiance." France is once more attempting to establish a form of government which rests upon mutual confidence, which is far more English, if an Englishman may be allowed to use the expression, than those literal copies of the English Constitution which were such an abomination to Michelet.

If France is to overcome her own faults instead of placing her glory in that military success which has been deservedly snatched away from her, it will be because the lesson of union and devotion which breathes in every page of Michelet's writings has sunk into her heart. M. Monod has not merely given us a sketch of the life of an historian. He has written a page of contemporary history.

SAMUEL R. GARDINER.

NEW NOVELS.

Harry Heathcote of Gangail; a Tale of Australian Bush-life. By Anthony Trollope. (London: Sampson Low & Co., 1875.)

Lady Hetty; a Story of Scottish and Australian Life. In Three Volumes. (London: Daldy, Isbister & Co., 1875.)

The Village Surgeon; a Fragment of Autobiography. By Arthur Locker. (London: Sampson Low & Co., 1875.)

THE interest we take in Australia and Australian life is for the most part a domestic interest. We trouble ourselves comparatively little with the politics, the social progress, or the intellectual development of our colonial possessions. But so many English families have overflowed into those possessions, so much family feeling is now centred in them, that English people care to know details of every-day life and of every-day experience which may be familiar to some of the sons and brothers who have left them. It is this which makes Mr. Trollope's short and vivid sketch called *Harry Heathcote of Gangail* so much more acceptable than many volumes of travels in Australia would be. We care to know not only how things look, but how people feel about them out there; how those whom we have known live and act in that far-off home. As Charles Lamb says: "The weary world of waters between us oppresses the imagination," and when a spirited and characteristic sketch is drawn for us of that which we are unable to picture for ourselves we cannot help being grateful. Mr. Trollope has such a happy faculty for sketching domestic life, and of giving reality both to his characters and scenery, that he is fitted above most writers for conveying to us impressions of an unknown land; we only wish that his work had been longer and fuller, or that he would introduce a great deal of Australian life into some future book. *Harry Heathcote* is a young squatter who has fought his way into a tolerably secure position in Queensland.

"He owned 30,000 sheep of his own, was a magistrate in those parts, and able to hold his own among his neighbours, whether rough or gentle, and some neighbours he had very rough, who made it almost necessary that a man should be able to be rough also on occasions if he desired to live among them without injury. *Heathcote* of *Gangail* could do all that."

There is not much elaboration in the story; it is a simple record of the difficulties this man had to contend with from unpleasant neighbours and discharged servants. To English ears it sounds strange that a man should be living in terror of his fences being burned down and his property being ruined, but the excitement and anxiety of the settler are evidently drawn from the life, and are sufficiently well depicted for us to be thoroughly interested in them. The little romance of the story is a very slight thread indeed, and is nothing but a concession to the popular taste, which would not think a Christmas story complete without it; but the character of the hero, *Harry Heathcote*, and the interest of his simple unconventional life, require none of the usual adjuncts of fiction. The book does not take long to

read, and will well repay the reader. It gives much more practical information about Australia than *Lady Hetty*, which calls itself *A Story of Scottish and Australian Life*, but tells us little more of Australia than that "it's a Paradise as big as Europe and it's tae let." The book is confused and somewhat wordy in style, though it contains some writing which is superior in many respects to the ordinary run of three-volume novels. The story we are told was originally published in *Good Words*, under the title of "Novantia." It is full of Scotch talk, which no longer has the charm of novelty, and requires to be very well done to make it endurable. Most of the sayings of David Groat, the old gate-keeper, are characterised by grim humour or pathos; indeed, it is difficult to say why the book is dull as a whole, because there is a good deal that is amusing scattered up and down through its pages—the sketch of Mr. Garsegreen, the preacher, for instance, who roared "his sermons and his prayers like an easterly gale into the four corners of the church;" the woman Rachel, who was so "sorry for her mother's death, that she wished her mother could just be alive to see how sorry she was;" Mrs. Corrypeel's views of Providence:—

"How wonderfully kind the Lord has been to me! There were seven of us in my father's family, four brothers and three sisters, and only ten years ago they were alive and well, and I being the youngest of them, and the most delicate too, had the least chance of being my uncle's heir; but they have all been removed one by one, and here am I this day in possession of the estate."

All these passages show that humour is not wanting. Neither is the plot a feeble one; the young Scotch clergyman and his sister, who discover at the most critical period of their lives that they are the children of a convict, are characters of whom a great deal more might have been made; but the situations of the story are rendered ineffective by a want of power over them, and the book leaves a dreary and unfinished impression on the mind of the reader.

Of *The Village Surgeon* nothing more can be said than that it is not a pleasant story, and the tedium of its commonplace is only broken by melodramatic incidents; such, for instance, as a ghastly scene in which the surgeon makes a dead man affix his signature to a paper. These melodramatic touches accord badly with the semi-jocose style of the rest of the book.

F. M. OWEN.

MINOR HISTORICAL BOOKS.

MR. GREEN's series of primers led off well with Dr. Morris's English Grammar. But we are not sure that Mr. Fyffe's *Greece* (Macmillan and Co.) is not worthy of equal commendation. Examples more or less recent are not wanting to teach us that learned men can write histories which are supremely dull, and if any body had proposed to tell the whole story of Greece down to Mummian and the siege of Corinth in 127 small pages we should have been inclined to admire his boldness without being much inclined to augur well of his success. Mr. Fyffe, however, has succeeded where so many have failed. All the main points of the history are well brought out,

while the secondary points are judiciously dropped, and the whole is written in a plain easy style which the boys and girls who read the book will probably take for a sign that the writer has had no difficulties whatever to overcome, but which their more knowing elders will perceive to be the result of much study and of the exercise of a ripe and independent judgment. In such a case, however, it is better to give a specimen than a lengthened comment. Take, for instance, the sketch of Perikles:—

"He did not place himself above the laws, like a tyrant, and make the people obey him by force; but, remaining a simple citizen, he was able to rule the people through his eloquence and his wisdom, and, above all, through the perfect nobleness of his character. In making Athens treat her allies like subjects, and in giving the citizens pay for attending to public business, he was no doubt wrong; and he was mistaken in thinking that the people might be trusted to follow a wise leader in preference to a foolish one. But no man ever devoted his life more high-mindedly, and with less thought of self, to the service of his country; and for this, and for the great wisdom and success of his management generally, and still more for the noble idea which he had of raising all Athenian citizens to intelligence and good taste, Perikles is often considered the finest of Greek statesmen. One part of the work of Perikles will never be out of date. The best men in England and other free countries in our own day have the same feeling as Perikles had towards the people. Like Perikles, they wish to see the whole people, poor as well as rich, taking their fair share in the government, and interested in what goes on in the State; and they believe that the happiness of a country will depend more than anything else upon the education and improvement of the people. More than any man, Perikles gave to the Athenians that love of knowledge, of poetry, and of art, which remained to them when their military greatness was gone, and which more than its military greatness has made Athens of service to mankind. He did not give the people book-learning, for little book-learning existed in those days; but he tried to wake up all their faculties by making their daily life bright and active instead of dull and listless, and by giving as much interest and nobleness as possible to the things in which the whole people joined, such as the worship of the gods and the public amusements."

Finally, Mr. Fyffe after doing so much to satisfy the desire for knowledge, ends by pointing out how little can be learned of Greece by the fullest Greek history. To understand the Greeks we must read the books written by the Greeks. "No one" he concludes by saying, "who has taken the trouble to make himself thus acquainted with the Greeks, has ever regretted the labour which it cost him."

COLONEL MALLESON'S *Studies from Genoese History* (Longmans) is a well-meaning attempt to give some information about Genoa to the ordinary reader. The book has been written in India, and does not contain much that could not be found in the pages of Sismondi. We are afraid that we cannot agree with Colonel Malleson in thinking that his book will "give a more vivid sketch to the public mind than could be derived from the perusal of a more methodical narrative." His treatment is hopelessly confusing. He begins abruptly at the transfer of the suzerainty of Genoa from France to Spain in 1528, and then gives an account of the conspiracy of Fiesco. After giving a few of the leading incidents in Genoese history from that time up to 1628, he suddenly begins a biographical account of the Doria family, from the year 1191. So rigidly biographical is he, that he breaks off the account of the great campaign of Chioggia at the death of Pietro Doria, and tells us in a note that the continuation will be found in a later chapter, where he is engaged in a similar account of the family of the Grimaldi. We grant that it is difficult to group the details of Italian history; but certainly Colonel Malleson has not succeeded in overcoming it in a way that will increase the interest felt by the general public for whose good he writes. In other points, too,

Colonel Malleson does not seem fitted for the task he has undertaken. He makes Bonfadio say, "I read the first of the *Politica* of Aristotle." He is careful to confine himself to quotations from other authorities for an opinion on Bonfadio's merits. His power of translation may be judged by the following:—

"Dunque direm de vostri scritti poi,
Quel che forse di rado in altro è detto;
Così scriss' ei, così fu fatto a punto."

This, he says, may thus be imperfectly rendered:—

"In your writings we feel most acutely,
A virtue so rarely conferred;
The events you describe so minutely
Are just the events which occurred."

Perhaps this translation will show how far Colonel Malleson can be received as an exponent of the Italian mind.

A Sketch of the German Constitution and of the Events in Germany from 1815 to 1871. By A. Nicolson, Third Secretary in Her Majesty's Embassy at Berlin. (Longmans.) It is happily not unfrequent of late for members of the British diplomatic service to pursue literary labours. Who, indeed, is better able to report on the economical, social and political condition of the foreign country in which he resides, than an accomplished secretary of legation? The communication of his researches and observations will be the more welcome and valuable if he treats the public very much as he would treat his chief or the Foreign Office, viz., if he reports with as little passion and bias as possible. We are glad to say that this is the case with the first book published in English on the German Constitution, which, doubtless, will meet with due acknowledgment in Germany. The author wishes to explain to his readers the present form of government in Germany, and judiciously prefixes a succinct, unassuming, and fair sketch of the events which since the dissolution of the Holy Roman Empire have been leading towards the re-establishment of national unity. After his preliminary narrative of the events down to 1871, the author sketches the Constitution of 1867, which was to a great extent identical with that adopted by the new Empire in 1871. It would have been a great help to the eye if he had printed as an appendix the text of the two Constitutions in parallel columns.

In the preface readers are referred to some of the more important German works on the subject, from which the author himself evidently derives much of his knowledge. In the text he quotes occasionally as his authorities for the series of events in Germany the histories of our time by W. Menzel and E. Arnd. In both respects his references are incomplete, and the author gives no opinion on the relative value of the different books which he quotes. It is curious that two most useful publications by L. Hahn on the period since 1866, containing every document on the wars with Austria and France, as well as on the rise and growth of the new constitutional order, seem to have entirely escaped his notice. Moreover, every German critic will point out the omission of a very important dissertation on the Constitution of the Empire by R. v. Mohl, and a number of excellent articles contributed by H. v. Treitschke to the *Preussische Jahrbücher*, ranging over almost the whole period, and examining the same constitutional results which are the subject of Mr. Nicolson's studies.

In spite, however, of these objections, and of the more detailed list of corrections which a German reader could easily furnish, the work is generally well done, and will doubtless soon reach another edition.

Caspar Bruchsius, *Ein Beitrag zur Geschichte des Humanismus und der Reformation.* Von Adalbert Horawitz. (Leipzig: Brockhaus.) The history of German "Humanism," i.e. of the revival of classical antiquity, falls naturally into

two periods, separated in time from one another, one extending from about the date of the invention of printing to that of the Reformation, the other coinciding with the second half of the sixteenth century. There is an inherent and essential, not merely a chronological, distinction between these periods. While during the first the foundation was laid of an entirely new culture, and mankind was stimulated to fresh productiveness in the political and religious life, no less than in literature; the last presents us only with an increase in the productions of learned men; the former is an important epoch in the history of the culture of the entire nation, the latter is merely the harvest time of the learned classes.

Caspar Bruchsius deserves mention among the leading men of the second period, as one of its most prolific, many-sided and comprehensive writers; yet, at the same time, one of the least known. It was accordingly an arduous undertaking to construct a biography out of the scattered materials relating to this subject. Herr Horawitz has honourably acquitted himself of this task with the diligence and care which are conspicuous in his other works upon the history of "Humanism."

Bruchsius was born at Schlackenwald, in Bohemia, August 19, 1518, and was found murdered in the neighbourhood of Rothenburg, on the Tauber, November 21, 1557. Although the career of this indefatigable man scarcely reached the term of forty years, it was one of the most varied activity. He was educated at the school of Eger and the University of Tübingen; subsequently, animated partly by the desire of furthering his studies, and partly by his restless love of travel, he visited many of the larger and smaller towns of Middle and South Germany, occupying himself by turns in teaching, writing, and preaching.

His works were, in accordance with a custom which prevailed among German Humanists until the last century, for the most part written in Latin. But Bruchsius so far differs from many of his contemporaries that he never despised the German language, which he proudly called his mother-tongue (p. 131). In this language he wrote many letters and short pieces, and translated many Latin books, as the short "Postils" of Philip Melancthon (p. 99), and the "Spiel von den sieben Weisen" of Joachim Camerarius (p. 189).

Among his Latin writings we chiefly find poetical and historical compositions. The former were composed chiefly for special occasions. They are often prolix, displaying little feeling, and letting the reader only too easily discover that their real object is money or favour. It is otherwise with his historical works. Bruchsius, who was a Protestant and finally a Lutheran pastor, although in the course of his life he displayed occasional Catholic proclivities, and even sang the praises of zealous Catholics when he had enjoyed their bounty, devoted himself especially to German Church history, for he was a true German, alike in his private views and his literary undertakings. In his history of the German bishoprics he treats of fourteen bishoprics, and in his history of German monasteries of 180 foundations, giving a complete enumeration of those who presided over them from the earliest times until his own days. In both these works the critical element is more conspicuous than attention to strict chronological sequence; of all his works these alone, from the wealth of material which they offer, have been much used.

Herr Horawitz has devoted much toil to this most useful undertaking. His narrative, which is as lively as could possibly have been expected considering the dry materials with which he deals, is enriched with twenty-four letters, documents, and writings not previously printed or even known, the communication of which is very welcome; he has displayed much diligence in collecting information from the most diverse sources, and he has been guilty of a very few oversights, readily pardonable in so lengthy a work.

Needful as it really was to revive the memory

of Brusch, it will never be possible to depict that writer in a dignified or amiable aspect. For while it is possible that the adverse verdict upon Brusch which pronounces him the representative of the vagrant, sycophantic, gluttonous section of the learned world may be too severe, it must still be confessed that his work and his life were alike lacking in stability and in that becoming dignity which gives to eminent mental endowments their true distinction, and the want of which is so often to be deplored even in men of genuine abilities.

EDITOR.

NOTES AND NEWS.

THE Rev. Henry Deane, Fellow of St. John's College, Oxford, is about to publish an edition of St. Anselm's *Cur Deus Homo*, from a very ancient MS. which exists in the College Library. It will be annotated, and will have an introduction and appendices on the History, Philosophy, and Theology of St. Anselm.

MR. T. ERSKINE HOLLAND, Professor of International Law and Diplomacy in the University of Oxford, having delivered last November an inaugural lecture on "Albericus Gentilis," has received an address from the Municipal Junta of San Genesio, the native town of Gentilis, in which mention is made of the fact that, when he was banished from Italy with his father as a follower of the Reformation doctrines, he found refuge in Oxford, where he gave lectures on Jurisprudence. Thanks are given to the English Professor, who has not forgotten his Italian predecessor, "in questo tempo avventuroso in cui la libertà di coscienza, come la politica, dalle ospitali rivi del Tamigi, ove ebbe ricetto e scuola, spiccato il volo a quelle del Tevere, venne ad infrangere le catene della tirannide e a diradare le tenebre della superstizione."

MR. THOROLD ROGERS has just printed (to be published by the Oxford University Press) a complete collection of the protests of the Lords, from the earliest on the Journals to the present time, with an historical introduction to each protest, copious indexes, and an essay on the origin of the custom of protesting, and the historical importance of the documents. The work, in three volumes, will be out early in May.

THE next addition to the Aldine Poets of Messrs. George Bell and Sons will be, we are glad to hear, the Poems of George Herbert, re-edited by Mr. Grosart from his collection of the complete Works in the Fuller Worthies Library. The whole of the new poems in English and in Latin will be given in the Aldine volume, over and above a critically revised text of the others.

MR. W. R. S. RALSTON, author of *Russian Folk Tales*, &c., has been elected, at the personal nomination of the Czarevitch, Corresponding Member of the Historical Society of St. Petersburg. He has resigned his appointment at the British Museum.

WE learn with regret that Mr. Hermann Bicknell, whose long-promised complete version of the poems of Hafiz was announced lately as ready for the press, has suddenly died. We hope that the results of his life-long labours will not on this account evade publication.

DR. THEODOR SCHWANN, Professor of Physiology at the University of Liège, has received from the German Emperor, in recognition of his great services in advancing physiological enquiry, the order "Pour le Mérite."

MR. T. S. BARRETT will shortly issue, through Messrs. Provost & Co., a new work entitled *An Introduction to the Study of Logic and Metaphysics*.

M. HENRI DE MEISTER is about to publish his intimate recollections of Mendelssohn, Goethe and Beethoven, with several letters from Mendelssohn to the poet, the composer, and the author of the forthcoming recollections.

THE *St. James's Magazine* for May will contain some unpublished letters to Mr. R. H. Horne, the author of *Orion*, by Mrs. Barrett Browning, who gives therein the original plan of her *Drama of Exile*, and some excellent criticisms on Charles Dickens, Victor Hugo, and other contemporaries. In the same periodical will appear the opening chapters of a serial story by Mr. Evelyn Jerrold, entitled "The Dread Reckoning."

M. CHARPENTIER has added to his useful series "Contemporary Literature in the different States of Europe," an account of the intellectual movement in United Italy, and a History of Contemporary Literature in Russia. A description of modern English literature by M. Odysse Barot was published several months ago.

It is said in Paris that the manuscript of an unpublished novel by Balzac has been found by the family of De Surville, with whom Laure de Balzac, the novelist's sister, was connected by marriage. If there be any truth in the rumour—and nearly all Balzac's biographers have asserted that he left several literary relics—the newly-discovered romance is a realistic story of Parisian industry, probably appertaining to the *César Biroteau* series.

IN collecting materials for the life of John Locke, on which he has been engaged for some time past, Mr. R. Fox-Bourne, the late editor of the *Examiner*, has come across several of the philosopher's inedited writings. They deal chiefly with free thought in religion, and will probably be included in the biography which is about to appear.

M. AMYOT, the Paris publisher, has in the press a collection of the unpublished letters of Mme. Swetchine to the Comte de Lagrange.

MR. GEORGE BARNET SMITH is preparing an essay on the last years of Shelley's life—a complement to his study of the poet's youth which appeared in the *Cornhill Magazine* two or three months ago.

PROFESSOR BLACKIE is engaged on a volume of Gaelic translations, which will be published in Edinburgh.

THE Annual Meeting of the Woolhope Naturalists' Field Club was held in their room at the Free Library, Hereford, on Monday, April 13. The Rev. Charles J. Robinson was elected President for the current year, and it was determined to devote a sum (not exceeding 30*l.* in the present year) to the purchase of scientific books for the use of the Club. The field meetings are appointed to be held at the following places:—May 20, Caerleon; June 15 (in conjunction with the Cotswold Club), Symonds' Yat and Monmouth; July 13 (ladies' day), Skenfrith, Grosmont and Garway; August 9, Brecon. The "Fungus Foray" will take place in the month of October, and upon the day of meeting there will be an exhibition (in the club room) of the choicest kinds of apples and pears grown within the county, as well as of funguses collected by members. An interesting paper on "British Arachnidae" was read by Mr. Theophilus Lane, and in the evening, after dinner, the retiring President—the Rev. James Davies—delivered his address, detailing in very felicitous language the transactions of the Club during his year of office.

IN the Bodleian Library is preserved a copy of the Gospels best known as the "Gospels of Mac Regol," but also called the "Rushworth Codex" and "Rushworth Gloss," from its having been presented to the library by John Rushworth, the well-known secretary of Fairfax, deputy clerk of the Long Parliament, and collector of State papers. Some specimen pages of it have been lately included among the Facsimiles of Irish MSS. which are being prepared under the photocynographic process at Southampton. Wanley supposed this volume, which possesses an Anglo-

Saxon interlinear gloss, to have belonged to the Venerable Bede, but other internal evidence, which it is unnecessary to give here, seems to fix the date of it a century later. The most striking features of the volume are its figures of the three Evangelists, Mark, Luke, and John, and the initials of each Gospel, all of them severally occupying an entire page. The chief point in the large initial page of St. John, which has been selected for facsimile, is terminated by the bust of a man with an enormously long beard and whiskers, brought to a point and laced together in a large knot, and a yellow pigtail of yet larger dimensions, arranged in a fanciful manner on the back of his head, much after the fashion of some head gear of the present day. In his right hand this curious figure bears a pastoral pipe, by the music of which he is trying to charm a serpent; and while he holds this pipe between his lips with outstretched fingers, he at the same time applies the end of his thumb to the tip of his nose. The sinister chief and dexter base points of the same page are each terminated by an interlaced double-headed creature, bearing somewhat of the semblance of a turtle or tortoise; a modification of which figure is also introduced within the border proper. The sinister base point is imperfect, but still presents the likeness of two human heads. In the centre of either side of the border is a projecting ornament grounded with looped lines, and having each in the centre two monsters of dragon-like form, one red, the other purple, either embracing one another, or engaged in combat. These monsters also appear elsewhere in the page. They may be intended for dogs with their fore-legs curiously distorted, but their appearance is not such as to furnish a clue to their identification with any known animal.

WE regret to learn that the health of the great American poet Walt Whitman continues in an unsatisfactory state. One of his London correspondents has just received the following scrap in his handwriting—which latter, we may add, shows no sign of alteration: "Still unwell and paralysed, but up and around. Post-office address at Camden, New Jersey, U.S.A.; shall probably remain there. Design to bring out a volume, *mélange* of prose and verse, partly fresh matter, this summer." An American paper, *The New Republic*, in calling attention to what Mr. J. A. Symonds has written in praise of Whitman, and to the disgraceful neglect of the poet in his own country, remarks that he "has not, even to this day, found a publisher for his works, which (though the demand is steady and not inconsiderable) cannot be procured at all at the stores, and the small editions of which, so far, Whitman has printed himself." The same paper refers to "a late lecture in St. George's Hall, London, by a Cambridge man, Professor Clifford, before the crowded scientific and aristocratic élite of Britain, on 'The Relation between the Sciences and Modern Poetry'; in which the Professor, reading mostly from the pieces of Whitman (the report in the English paper says 'amid hearty and general applause'), put him decidedly at the top of the heap, and pronounced him the only poet whose verse, based on modern scientific spirit, is vivified throughout with what Professor Clifford terms the 'cosmic emotion.'"

AT a recent sale of autographs, held by Messrs. Sotheby, some Shelleyan scraps were disposed of, and secured for an American purchaser. They include, *inter alia*—(1) a copy, in Mrs. Shelley's handwriting, of her husband's verses named "The Tower of Famine;" (2) his own MS. of the "Lines written during the Castlereagh Administration;" and (3) a brief letter from Mrs. Shelley. The discovery of this copy of "The Tower of Famine" (1) may disappoint some Shelleyan students, who indulged the hope that one day the original writing by the poet might turn up, and rectify the manifestly very incorrect printed form of the poem. Mrs. Shelley's copy having now been found, it may be feared that none other will ever be forthcoming. This transcript corre-

sponds with the printed version in all respects save one. In the lines

"It is built
Upon some prison-homes, whose dwellers rave
For bread and gold and blood,"

the MS. substitutes "With bread," &c., which seems less approvable than the printed word. (2) Shelley's own MS. of the Castlereagh stanzas supplies two emendations. The first stanza had been printed thus:—

"Corpses are cold in the tomb,
Stones on the pavement are dumb,
Abortions are dead in the womb,
And their mothers look pale, like the white shore
Of Albion, free no more."

It now turns out that the phrase ought to run "the death-white shore"—a great improvement, both in metre and in force of meaning. Then, in the last stanza, Castlereagh is thus adjoined:—

"Marry Ruin, thou tyrant! and God be thy guide
To the bed of the bride!"

The real word is not "God" but "Hell." (3) The letter has a peculiar interest, inasmuch as it appears to be written by the then very youthful Miss Mary Wollstonecraft Godwin to Shelley, at the time (June or July, 1814) immediately preceding their union, and elopement to the Continent. This may be inferred from the statement in the letter (or rather note, for it is merely a short scrap) that Miss Godwin has "heaps of Skinner Street news,"—i.e. news of her own paternal home—to impart to Shelley; for one cannot fix upon any other period in the lives of Shelley and Mary to which such a remark can probably be assigned. The character of handwriting, moreover, is rather coarse, and thus unlike that of Mrs. Shelley's married days. No letter from Mary to Shelley, or from him to her, proper to the time of their courtship, has ever been published. The American owner of the present missive may therefore be congratulated on the rarity of his acquisition.

MR. HENRY HUTH has just issued, in two volumes, his fresh set of reprints of most extraordinary rarity, which we mentioned, some months ago, as then in the press. He entitles his book "*Fugitive Tracts written in Verse*," which illustrate the condition of religious and political feeling in England, and the State of Society there during Two Centuries: First Series, 1493-1600; Second Series, 1600-1700." Beginning with Pynson's *Life of St. Petronilla* and *Foundation of the Chapel of Walsingham*, the collection ends with the quaint adventures of Chaucer's Wife of Bath in the next World,—how her tongue was so sharp that they declined to have her in hell, so she knocked at heaven's gate, and so scolded all the Patriarchs and Apostles who refused to let her in, that at last, on proving her true repentance and faith, she was admitted. Lord Spencer's library contributes perhaps the least known and most interesting reprint in Mr. Huth's volumes, "A book in English metre, of the great Marchaunt man called *Dives Pragmaticus*, very preaty for children to rede: wherby they may the better, and more readyer, rede and wryte wares and Implementes, in this world contayned," 1563. The names of all the trades, and of the different kinds of goods sold by the "great Marchaunt" are most valuable for illustration of our dramatists. The list includes nearly every conceivable thing, from the "fine coloured heare" which Shakspeare so often scolded ladies for wearing; "bolsters and pylowes of down to lay under mens heades," instead of the "good round log" that Harrison says served the men of Shakspeare's youth; carpets, pigs, geese, "papers with stories, to nayle on a wall," pole-axes, buns, troughs, combs, and spinning-wheels, medicines, flails, guns, marmalade, polecats, "fine toothpikers" and whistles, hounds, case-knives, "little calves mawes," "ornamentes fit for the church," fish-hooks, surgeons' instruments new fetcht from the Jews, rods for children, forms, swords, and spectacles, &c. The prototype of Shakspeare's Autolycus, as Mr. Hazlitt says. The

rare Reformation tracts, like the Upcheering of the Mass, the Society of Antiquaries' unique Ballads, &c., go to make up a collection whose equal it is hard to name. But, alas! Mr. Huth has only printed fifty copies of it.

THE indefatigable French economist and publicist, M. A. F. de Fontpertuis, has published an essay entitled *L'Etat Économique Moral et Intellectuel de l'Inde Anglaise*, which shows a careful study of the best and latest sources of information respecting the condition of India. The only criticism we have to make is, that Tacitus himself would not have admitted the close resemblance to the ancient Germans which M. de Fontpertuis discovers in the most miserable and uncivilised Indian tribes. M. de Fontpertuis is usually a very impartial writer, but no Frenchman can now forego an opportunity of disparaging the German race. Guizot and his contemporaries used to trace modern liberty, and much that is best in modern society, to the Germans, but the late war has founded a new historical school which sees nothing but savagery in ancient German manners and life.

GUSTAV SCHMOLLER, Professor of Political Economy at Strassburg, has published an essay entitled *Ueber einige Grundfragen des Rechts und der Volkswirtschaft*. Professor Schmoller is one of the most energetic and leading German economists of the younger generation. The object of his essay is to define and vindicate the position of the so-called *Katheder-Socialisten*, as opposed to Socialism and the "Social democracy" on the one hand, and to the optimist "Manchester School" on the other. He contends for social reforms against both revolutionary projects, and the doctrine of *laissez faire*; and urges the necessity of taking account of national institutions, customs, and morality in economic theory. Instead of a perfect economy, such as the Manchester School sees in the present arrangements of society and the actual distribution of wealth, he sees much injustice and danger to the State.

THE annual meeting of the Society for the Study of the Romance Languages took place at Montpellier on March 31. It was opened by M. Ch. Revillout, who installed as Presidents MM. Egger and Frédéric Mistral; MM. Mila y Fontanals, of Barcelona, Michel Bréal, and Gaston Paris being Vice-Presidents. Prizes were awarded to Professor Ascoli, of Milan, for the first part of a great work entitled *Schizzi franco-provenzali*, and to the authors of two original poems.

THE Urban Club will hold its annual Shaksperian dinner and festival at St. John's Gate on the anniversary of the Poet's supposed birthday, April 23, 1564, three days before his baptism on April 26. For the sixty places at dinner there have been above a hundred applications by members of the Club.

GEORGE HERWEGH died at Baden on the 17th ult. Born at Stuttgart in 1817, and educated at Stuttgart and Tübingen, he was serving in the army when, in consequence of a quarrel with an officer, he was forced to take refuge at Constance, which he soon left for Zürich. There he published in 1841 his *Gedichte eines Lebendigen*, a collection of republican poems, which passed through seven editions in two years, and was followed by a volume entitled *Xenia*, or epigrams addressed to certain men or institutions in Germany. After a brief and triumphant sojourn in his own country he retired to Zürich, where he published his *21 Bogen aus Schweiz*; but was speedily compelled to leave Zürich for Bâle, whence he removed to Paris. In April, 1848, he put himself at the head of the French and German workmen who made the revolutionary campaign in Baden with Struve and Brentano, and on their defeat took refuge first in Switzerland and afterwards in France. He has published nothing of late years.

M. JULES GAUTHIER'S *Histoire de Marie Stuart* has just reached a second edition.

MM. MICHEL LÉVY FRÈRES have just published a new work entitled *Thérèse*, by Alexandre Dumas.

PROFESSOR CHRISTIAN FLOR died at Kiel on March 30. He was born in Copenhagen on January 1, 1792, and succeeded the poet J. L. Heiberg as Lector in Danish Language and Literature in the University of Kiel. Through all the troublous times that preceded and followed the first Slesvig-Holstein war, Flor distinguished himself by his active loyalty to the Danish cause. As an author he is chiefly known by his *Haandbog i den danske Literatur*, "Hand-book of Danish Literature," a book which has gone through seven editions, and is of the very highest value to any student of Scandinavian literature. It was first brought out, in 1838, in a very humble form, at a provincial press, but soon won its place as a standard work. He is also the author of a treatise on the Yggdrasil myth.

ON March 28 died at Copenhagen, at the age of forty-four, Professor Christian Krarup, widely known in the north of Europe for his scientific investigations into the laws of ventilation.

Nær og Fjern for April 4 contains a pretty little poem by Hans Christian Andersen, "Den korteste Nat"—"The Shortest Night."

IN the current number of the *Theological Review*, R. B. Drummond, taking as his text a remark made by Mr. Froude in his inaugural address at St. Andrews, contributes a sketch of the characteristics of Calvinism in principle and practice; but the two most interesting articles are C. B. Upton's second notice of Mr. Mill's *Essays on Religion*, and a discussion by T. K. Cheyne of a "disputed prophecy in Genesis." In the former, the language of Mr. Mill in the third of his essays is placed in strong contrast with the opinions implied or declared in his other writings; and the gradual modification of his position in the direction of Theism is traced by an appreciative and sympathetic hand. In the latter, Mr. Cheyne re-examines the prophecy respecting "Shiloh," and although a doubt may suggest itself whether the fidelity of the Septuagint translator is as clearly established as his argument requires, his criticism of the interpretation now generally acquiesced in, and the careful use made of the Septuagint version with a view to the discovery of the original reading, deserve well the consideration of scholars.

NOTES OF TRAVEL.

News has just arrived of Lieutenant Cameron having actually entered the Manyema country at the southern border. The report was that he was expected to be absent from Ujiji for about twelve months. Before leaving Ujiji Lieutenant Cameron dismissed all *pagazis* who feared to accompany his expedition beyond Lake Tanganyika. He had despatched one man to purchase goods for him at Unyanyembe, but unfortunately the man did not arrive at Ujiji again until after Lieutenant Cameron's departure. He deposited the goods bought at Unyanyembe with Muhammad bin Sualim of Ujiji, and then came down to Zanzibar. The discharged men have also arrived on the coast, with notes from Lieutenant Cameron dated May 18. This is still the latest date under the explorer's own hand. Dates from Zanzibar are down to March 11.

WITH a view to an Arctic expedition next year, the Germans will carefully study the equipment and arrangements of the *Alert* and *Discovery*. For this purpose several German naval officers will visit Portsmouth in the third week of May. The first officer of the last German expedition, Mr. Sengstracke; Captain Gutkese, of Bremerhaven, and Dr. Ralph Copeland, the astronomer of the *Germania*, who will by that time have returned from observing the transit of Venus at Mauritius, have been deputed for this service. They will be accompanied by Dr. Lindeman, the secretary to the German Polar Society, and Dr. Finsch, the director of the Zoological Museum at

Bremen. The German expedition will adopt the same route that was taken by the *Germania*—namely, the east coast of Greenland; and, judging from the reports of Captain David Gray, it is anticipated that a much higher latitude than has yet been attained may be reached by following this east coast.

THE *Pandora* is being fitted out by Captain Allen Young at Southampton, and strengthened for ice navigation. She will probably sail for Baffin's Bay in the end of June. The stories in the newspapers with respect to the *Pandora's* voyage are wholly incorrect. There is no intention of accompanying or following the Government Arctic Expedition, and the voyage is entirely unconnected with Mr. Gordon Bennett or the *New York Herald*. Captain Allen Young and his friends simply intend to make a summer cruise up Baffin's Bay, and to secure such scientific and other results as may be attainable during the trip.

AN Italian African Expedition is about to be despatched, which has selected one of the most interesting lines of country for examination that remain to be explored in Africa. Landing on the shore of the Red Sea, the party will first proceed to Ankobar, the capital of the Abyssinian kingdom of Shoa. It will then direct its march over the almost entirely unknown region to the westward, and across the Galla country in the direction of the Victoria Nyanza. Very few Europeans have ever penetrated the region south and west of Shoa, including the kingdoms of Enarea and Kaffa. Only two or three Roman Catholic missionaries have ever gone forth in this direction, chief among whom is Father Massojah, the author of a Galla dictionary. Yet this region is one of special interest. It is known to be mountainous, and to enjoy an analogous climate to that of the Abyssinian highlands. Its valleys yield excellent coffee, for when the British troops were at Senafe, a merchant arrived there with coffee, who had made his way from Kaffa and was endeavouring to reach the sea-port of Massowah. But he was murdered in the Degouta Pass by Shoho plunderers. The Italian explorers will achieve a great and valuable work if they succeed in exploring the unknown region between Shoa and the Victoria Nyanza.

DR. BESSELS, the scientific member of the American Polar Expedition under Hall, has written a letter to the Paris Geographical Society in which he deprecates too great reliance being placed on Captain Tyson's so-called observations, as he was totally unacquainted with the use of scientific instruments. Dr. Bessels was the only skilled observer in the ship, and though the observations he took are not perhaps so extended as they would have been in a more genial climate, they were, nevertheless, carefully taken, the magnetic observations being the most complete ever taken within the Arctic circle. The drift wood on the shores of Smith Sound proved to be a closely-grained wood of coniferous trees indigenous to a cold climate. Most of the meteorological observations were preserved, though many of the records and collections were unhappily lost on the parting of the ice-floe from the ship. Eight kinds of mammals and twenty-three kinds of birds were discovered. The fossils were but few in number in Polaris Bay, but traces of drift wood were found at the height of 1,800 feet as well as sea-shells similar to those still found in Smith Sound. This proves that the shore of West Greenland is rising. Another interesting feature mentioned by Dr. Bessels is that there appears proof that Greenland has been rent from North America by some convulsion of nature, and that the set of the current in Smith's Sound and Baffin's Bay was in former days northward instead of southward, as now. This theory he has dwelt upon at some length in a paper read before the National Academy.

It is well known that the Chinese are much averse to encouraging all attempts to develop the mineral resources of their country. Gold-hunting, in particular, is carried on seemingly under very adverse circumstances, for in a recent number of the *Peking Gazette* a memorial is published from Yi Jung, Military Governor of the province of Kirin, in which that official reports the complete extirpation of the bands of rebellious gold-hunters who have lately troubled the region of Ninguta and Sansing, between the rivers Usuri and Sungari.

WE are sorry to learn from the German papers that Dr. Schweinfurth has received communications from the Upper Nile district, announcing that his faithful guide and companion, the Nubian elephant-tusk trader, Mohammed Abd-es-Samat, has fallen a victim to a murderous attack made upon him in his Seriba (or fortified factory) by a band of Niam-Niam soldiers. Abd-es-Samat deserves the respect and gratitude of all persons interested in the progress of African exploration, since it was to him that Dr. Schweinfurth was indebted for the means of entering the dangerous and hitherto almost unknown lands of the cannibal Niam-Niams. The value of his friendly assistance in allowing the European traveller to join his trading expedition, and thus make his way through this interesting country, was recognised both in Germany and Egypt, and besides being decorated with medals and various orders by the German Emperor and the Khedive, he had received the distinction of being named honorary member of the Society of Natural and Physical Sciences at Riga, the birthplace of Dr. Schweinfurth. Shortly before his death last December, Abd-es-Samat had forwarded to his European friend a valuable and interesting collection of objects, illustrating the industrial arts of the Niam-Niams, and these we learn have now been presented by Dr. Schweinfurth to the Ethnographic Museum at Berlin, where they will afford important help in elucidating some of the unsolved questions connected with the history of African culture.

Unsere Zeit announces that a subscription of 5,000 florins has been raised in Austria to assist Ernst Marno, the naturalist, in his researches in Africa. Herr Marno, it will be remembered, was selected by the Geographical Society of Vienna to fill the post of naturalist to Colonel Gordon's expedition in the Gondokoro district, at the time when that officer, who wished to give an international character to his undertaking, and who had already secured the co-operation of various other foreigners, applied to the Austrian Consul at Khartoum to enter into the necessary negotiations on his behalf for inducing a German observer to join his scientific staff.

WE regret to find that the late African explorer, Karl Mauch, to whose death we referred in our last week's number, has left the narrative of his travels incomplete, while unfortunately his notes and journals do not appear to be sufficiently comprehensive to admit of being used by any one but himself. From the obituary notices that have appeared of him in the German papers, we learn that Herr Mauch had been originally destined for the post of a national schoolmaster, and that after having prepared himself for such an avocation, and shown great capacity for scientific research, he was for some time a resident in this country as a private tutor, before he was enabled to carry out the wish which he had long cherished of making an expedition into Central Africa. On his return three years ago, with broken down health and in a condition of great poverty, he received some help from the King of Würtemberg, which, however, was insufficient to enable him to renew his explorations; and at the time of his death he had just undertaken, at Blaubeuren, near Stuttgart, the direction of some chemical works, for which his previous devotion to chemical and mineralogical studies had rendered him especially well adapted, and it was there that he met with the accident which has terminated fatally.

THE April number of the *Overland Monthly*, a magazine published in San Francisco, contains an interesting article on the characteristics of the Californian Indians, by Stephen Powers. The writer takes issue with Mr. J. C. Wood, who in his work on *Uncivilised Races of Men* says: "We can produce no vice in which the savage is not profoundly versed, and I feel sure that the cause of extinction lies within the savage himself, and ought not to be attributed to the white man who comes to take the place which the savage has practically vacated." This, Mr. Powers declares, is not true of the Californian Indians. Practices which among civilised people become vices were either unknown to the Californians or indulged in so moderately that no harm followed. With regard to the density of population he maintains that "there are regions of California which supported more Indians than they ever will white men." The very prevalence of the aboriginal crime of infanticide, he adds, points to an overfruitfulness and an over-population. They are a grossly licentious race:—

"Among the unmarried of both sexes there is very little or no restraint, and this freedom is so much a matter of course that there is no reproach attaching to it, so that their young women are notable for their modest and childlike demeanour. If a married woman, however, is seen even walking in the forest with another man than her husband, she is chastised by him; a repetition of the offence is generally visited with speedy death. Brothers and sisters scrupulously avoid living alone together. A mother-in-law is not allowed to live alone with her son-in-law. To the Indian's mind the opportunity of evil implies the commission of evil."

Many tribes discountenance the intermarriage of cousins, which they say is "poison." Since they have mingled with Americans they have developed a Chinese imitativeness, and they take rapidly to the small uses of civilisation; but they have no large force, no inventiveness. As labourers they seem to be superior to the Chinese, and command \$1 50 c. or \$2 a day with board, or \$1 a day when employed by the year, and farmers will trust them with valuable teams and complicated agricultural machinery to a greater extent than they do the Chinese. The Indian, it seems, endures the hot and heavy work of the ranch (farm) better than even the Canton Chinaman, who comes from a hot climate, but wants an umbrella over his head. "In a square stand-up fight the Indian will thrash the Mongol's head off." There is a wide-spread belief in the United States that food supposed to be rich in phosphorus produces brain-power. Mr. Powers discredits this theory, and attributes something of the mental weakness of the Californian aborigines to the excessive amount of fish which they consumed in their native state. It is generally accounted that fish is rich in brain-food, but it is, he says, "an indisputable fact that the grossest superstition and lowest intellects in the race are found along the sea-coast." He anticipates dissent from his opinion that, with the exception of a few tribes in the northern part of the State, a great majority of the Californian Indians had no conception whatever of a Supreme Being. They speak, indeed, of the Great Man, the Old Man Above, but they have the word and nothing more. This is a modern graft upon their ideas, because this Being takes no part in their affairs, is never mentioned in the real and genuine aboriginal mythology or cosmogony, creates nothing, upholds nothing. They all believe in a future state, but there is no conception of a God involved in their ideas of the Happy Western Land. As a description of the habits, mode of life, and physical, mental, and moral characteristics of these curious people, Mr. Powers' paper is minute and at the same time suggestive.

WE gather from the last printed official report from the Bahamas that the cultivation of the pineapple is rapidly spreading through that colony. Governor Pope Hennessy writes:—

"Not many months ago I had an opportunity of

seeing what is probably the largest field of pine-apples in the world. It is on the estate of Mr. J. J. Johnson, in the eastern district of New Providence; and from one spot it was possible there to see, at a single glance, 1,200,000 pine-apples growing. They were well weeded and in good order. This broad expanse of young fruit, in its clusters of delicately tinted but sharp and distinct leaves, gave a peculiar feature to the landscape. In appearance it had as little in common with the planes of sugar-cane or the paddy-fields of the tropics as with the corn-fields of Europe."

The total number of pine-apples exported to the United States and England (exclusive of tinned fruit) was 422,994 dozen, valued at 38,767*l*. Of pine-apples in tins, preserved and packed at the manufactory at Nassau, there were 69,165 dozen exported, of the value of 13,018*l*. Most of the pine-apples hawked about London streets come from the Bahamas. Their inferiority to the hot-house production of England is due to the necessity of cutting them unripe, so that they may outlive the sea voyage. The sponge trade there, too, is said to be becoming more valuable than that of Syria, though the quality of the sponges is not so fine.

HANS ANDERSEN'S JUBILEE.

FRIDAY, April 2, was Hans Christian Andersen's seventieth birthday, and the great poet's health is now so completely restored that he was able, we learn, to enter with full interest into the many festivities which his friends and countrymen had planned for his honour.

The day before he had been summoned to a private audience of the King of Denmark, in Amalienborg Palace, at the end of which he received the cross of a commander of the first rank, and the Queen and Princess Thyra loaded him with bouquets of flowers. Those who know the sensitive and child-like nature of the poet will easily understand how these pleasant attentions charmed him. On the birthday itself Andersen began the day by receiving crowds of friends in his pretty rooms in Nyhavn, who expressed their congratulations, and then made way for newcomers. Among letters and telegrams from all parts of the world, one document arrived which gratified the receiver excessively; it was a little illuminated address, bound in red velvet, and was brought by a deputation, including Baroness Holstein-Holsteinburg, Professor Vermehren, and several gentlemen and ladies of high position. It was an announcement that Danish men and women of all classes had concerted to petition the King to permit them to erect a statue to Andersen in Rosenborg Gardens, that exquisite retreat, in the centre of Copenhagen, where one steps at once out of the rattle and dust of the streets into a cool and sylvan silence under the shade of the beech-trees. The King has given his consent; the sculptors are competing for the work, and every Danish man, woman and child will be at liberty to contribute a skilling or an öre to the general fund. The intimation took Andersen completely by surprise; he was deeply moved, and then, after a moment, rose to thank the deputation in these words:—

"It is just fifty-six years to-day since I came here from Odense as a poor child. Since then much, much has changed, I feel; in my early life I possessed many qualities which were not understood, and I have gone through heavy days, but yet I would be thankful for these also, since they aided in developing my character. I have met much kindness and love in Copenhagen. I will not dwell on anything in special, but yet will just name Guldberg, the Collin family, and H. C. Ørsted. I often recollect with gratitude how Ørsted came one evening, when I was in despair, and consoled me with the assurance that times would come when in intellectual matters I should be better understood, but of such a recognition as this to-day I have never even dreamed. As soon as I heard there was a talk of raising a memorial to me, I felt embarrassed, I feared adverse criticism. So many have deserved

quite as much as I, and have no memorial. But this embarrassment left me when I found that the whole nation was as one man in pouring in contributions to this end. Specially, however, has it delighted me to see by the smallness of many of the contributions, that those who have but little to give have also wished to have part in the matter. It is a true joy to me that you have chosen the King's Garden as the spot, and there is a wonderful appropriateness in this, for I well remember how often, in the darkest days of my youth, I have wandered in there to eat my bit of bread, and now I shall see my own statue there. Yet I do not know whether Providence will grant me strength to see it raised, but I hope I shall at least be permitted to see the place prepared for it. I beg you to bring to all these friends my most hearty thanks."

An interesting work was published on the same day, in a splendid form, namely Andersen's fairy-tale, *Historien om en Moder*, "The Story of a Mother," in fifteen different languages, and edited by Vilhelm Thomson and Jean Pio. The translations were in Swedish, Icelandic, German, Plattdeutsch, Dutch, English, French, Spanish, Romain, Russian, Polish, Bohemian, Hungarian, and Finnish. The text of a Serbian translation came too late to be inserted, and a Bengalee version here in London evaded the editors' grasp in a most tantalising manner.

At the Royal Theatre were performed in the evening two of Andersen's pieces, *Den nye Barselstue*, "The New Lying-In Room," and *Liden Kirsten*, "Little Christina."

In Odense, too, the town where Andersen was born, public festivities were held. A tablet was placed by the municipality on the little wretched house, No. 28 in the Munkemøllegade, where he spent the most part of his childhood, and with which all his Odense memories are connected. It was not here indeed that he was born, but in a house at the corner of Bangs-Boder and Hans Jansen's Street, which latter, however, his parents left before he was old enough to remember anything of it in after years. The tablet bears these words:—"With this house the poet Hans Christian Andersen connects the dearest memories of his childhood. The municipality of Odense placed this stone on April 2, 1875, the poet's seventieth birthday." The children of the school where Andersen attended, 800 in number, formed a procession to the house; a vast crowd collected, and the Bishop of Fyen delivered an address. In the evening at the theatre the orchestra led off with "The Children's Greeting to Andersen," expressly composed by Herr C. C. Möller, and the poet's drama of *Meer end Perle og Gold*, "More than Pearls and Gold," was afterwards acted.

From Berlin came several congratulations from men of letters, including one from Berthold Auerbach. On occasion of the day, Andersen was elected honorary member of the new British Scandanavian Society. EDMUND W. GOSSE.

SELECTED BOOKS.

General Literature and Art.

- BEN JONSON, Gifford's Edition of. With Introduction and Appendices by Lieut.-Col. F. Cunningham. Bickers. 105*s*.
BROWNING, R. Aristophanes' Apology. Smith, Elder & Co.
BURGESS, J. The Architecture and Scenery in Gujarat and Rajputana. Marion & Co. 10*l*. 10*s*.
CARLYLE, T. Early Kings of Norway; and an Essay on the Portraits of John Knox. Chapman & Hall.
HULME, F. E. Principles of Ornamental Art. Cassell.
LELAND, C. J. Fu-Sang; or, the Discovery of America by Chinese Buddhist Priests in the Fifth Century. Trübner. 7*s*. 6*d*.

SCHUCHARDT, H. Ritornell u. Terzine. Halle: Lippert. 8 M.

CORRESPONDENCE.

A NOTE IN THE CODEX ALEXANDRINUS.

Trinity College, Cambridge: April 5, 1875.

On the back of the first leaf of the Codex Alexandrinus is a short Arabic inscription, accompanied by the following explanation in Latin, "i.e., Memorant hunc librum scriptū fuisse manu Theclae Martyris." Baber, in his edition of the Codex, expresses it as his opinion that the Arabic inscription was written some little time before the MS. came into the possession of the Patriarch Cyril, that is, early in the seventeenth century. The Latin translation, he adds, is "ab alia manu sed fere coeva." Mr. Scrivener, in his *Introduction to the Criticism of the New Testament* (2nd ed. p. 89), mentions the Arabic inscription, and states that it is "translated into Latin by another not very modern scribe."

When consulting Baber's edition of the MS. a few days since, I was surprised to find that this "not very modern scribe" is no other than Bentley himself, whose handwriting I recognised. It is well known that Bentley was King's Librarian and had charge of the MS. which he calls "the oldest and best now in the world," and that he collated it for his proposed edition of the Greek Testament. But I am not aware that anyone has observed the fact to which I venture to call your attention. WILLIAM ALDIS WRIGHT.

TRADITIONS OF THE DELUGE.

Kensington: April 6, 1875.

Now that we are gradually arriving at a common sense, though not the less Christian view of the obscure traditions of the Deluge—which later cuneiform decipherments have forced upon us—it may concern the Western World to learn the interpretation put upon the same event by the severed section of our race who dwelt beyond the waters of the Flood to the eastward. The belief among the ancient nations whose range was not confined within the boundaries of the Mesopotamian valley is summarised in the subjoined passage from a work of the celebrated Khārizmian mathematician and astronomer, Abū Rihān, Al-Bīrūnī. The date of its publication (or presentation) may roughly be fixed at something prior to A.D. 1012, and the locality of its composition and endorsement at or near Gūrgān, E.S.E. of the Caspian. It will be seen that tradition in the East in no wise contests the fact of a deluge, but consistently confirms it, as though its exponents in those parts had already accepted the more natural explanation of the narrowed limits incident to the general configuration of the country, which modern reason assigns to the Chaldean inundation.

The subjoined extract is taken from an unpublished translation of Al-Bīrūnī's *Athār al-Bākīya*, now in course of preparation for the Oriental Translation Fund by Dr. E. Sachau, professor of Oriental languages at Vienna.

"The Persians and the great mass of the Magians deny the Deluge altogether; they believe that the rulership (of the world) has remained with them without any interruption ever since Gayōmarak, Gil-

sháh, who is according to them the first man. In denying the Deluge the Indians, Chinese, and the various nations of the East concur with them. Some, however, of the Persians admit the fact of the Deluge, but account for it in another way, as it is described in the Books of the Prophets. They say a partial deluge occurred in Syria and the West in the time of Tahmúrash, but that it did not extend over the whole of the then civilised world, and only few nations were submerged in it. It did not extend beyond the peak of Holwán, and did not reach the countries of the East."

EDWARD THOMAS.

MR. PARISH'S GLOSSARY OF THE SUSSEX DIALECT.

52 Thornhill Road, Barnsbury, N. : April 12, 1875.

Mr. Skeat's letter calls for explanations, both to himself and to Mr. Parish.

I did not single out Mr. Parish's book for attack (I can promise similar treatment to any similar case), but called attention to its grave deficiency, the absence of phonetic information; if I have been the only one to do so, my remarks were all the more necessary. Words consist of two things, sounds and meanings, accurate knowledge of both being equally required by philology; and if any one who tries to help the science by recording dialectal words neglects half of his task, he can hardly complain of the fact being plainly pointed out for the guidance of other workers. The vexatious part of the affair is, as I said, that though local observers, and those only, can properly collect the phonetic facts of our dialects, most of them consider the business of little consequence; while, on the other hand, they attempt that for which their being local observers is of no advantage, and for which few of them are qualified, the discovery of the etymologies of the words they gather. My observations on the derivations in Mr. Parish's Glossary were intended only to show how much better the time and trouble he spent on them could have been employed; my complaint against the book is not that it does not contain good etymologies, but that bad or useless ones take the place of invaluable information about local sounds. Doubtless Mr. Parish did his best according to his lights, for he has evidently worked long and steadily, and in some respects he has done well; that his lights were imperfect is his misfortune and his readers', and I wished it not to be that of other glossarists. Philology has for years been a science, and it is time amateur workers at it were judged by a moderate scientific standard, not by the imperfect work of their predecessors; if the standard seems high to Mr. Parish, and my review consequently hard, that is scarcely my fault. I repeat, there is much of value in his book; far from implying it to be below the average, I said that its defects were but too common.

For Mr. Skeat's sound scholarship I have such a high regard, and English philology is so greatly indebted to his able and untiring exertions, that I much regret having, though unwittingly, appeared ungratefully harsh on anything he has done. I can only say that in taking as a reflection on his revision of the etymologies my lament over the misused phonetic opportunities of the glossarist, he has quite misunderstood me; and that having learnt the trying circumstances under which the revision had to be conducted, I do not wonder at mistakes having escaped him. I was certainly surprised, as we have the two words *dole* from *gedāl* and *deal* from *dāl*, and Webster does not confuse them, to see the ancestor of *deal*, and that only, given to explain the origin of *dole*; and as in each case but one related (if related) word is cited, I took the selected one to be meant for the real derivation, which, indeed, it frequently is. But I am too well aware of Mr. Skeat's qualifications for the study of English etymology—a subject bristling with often insurmountable difficulties—to consider any isolated errors of his specimens of anything but the liability of all

of us to mistakes, or not to aid, instead of discouraging, him in his arduous labour of replacing guesswork by sound knowledge.

HENRY NICOL.

Rhyl : April 12, 1875.

Without at all wishing to interpose between Mr. Skeat and the reviewer of Mr. Parish's *Glossary of the Sussex Dialect*, I may perhaps be allowed to say a word or two respecting the disputed "absurdity of connecting the word *kell* (a kiln) with the Welsh *cŷlen*." *Cŷlen* is a word I have never met with in Welsh literature, and I have searched in vain for it in the Welsh dictionaries which I happen to have by me. However, I find that Pughe has *cŷlyn*, a kiln, a furnace. Even this is perhaps not quite correct; at any rate, the word as I have heard it used in Cardiganshire is *cŷlyn*: it is there applied to an oat-kiln or a malt-kiln, while a lime-kiln is always *odyn* or *odyn galch*. There can, I think, be no doubt that *cŷlyn* is a word borrowed from English, and that probably not so very long ago. I need hardly call attention to the fact that, if the English *kell* or *kiln* has been subjected to Grimm's law, the corresponding Welsh word, supposing it not to be a loan-word, ought to begin with *g* and not with *c*.

On the whole, as far as regards English words commonly supposed by English dictionary-makers to be borrowed from the Celtic languages, it would be by no means a bad rule for those who have no leisure to study those languages for themselves to take the reverse as more probable. Nay, one might venture to say that a great number of the supposed Celtic words quoted in English dictionaries do not exist, at any rate in the form in which they occur in them. JOHN RHYE.

OLD CORNISH.

38 Sutherland Square, S.E.

With your permission I will make a few remarks on Mr. Lach-Szyrma's letter, which appeared in the *ACADEMY* of the 20th ult. Your correspondent has given a list of the numerals up to 20, which were written down for him in Cornish by a Newlyn fisherman, and compared the same with the cardinal numbers contained in the Cornish Grammar by the late Mr. Norris. If Mr. Lach-Szyrma had made the comparison with late Cornish instead of that given by Mr. Norris, he would have found the resemblance, which he aimed at, greater than he has shown it to be. For instance, (4) *Pay* is a contraction of *padzhar*, a late corruption of *peswar*—*dzh* being sounded as *g* soft. (5) *Pemp*. This form occurs in late Cornish. (6) *Welth*. This must be a mistake. There is no terminal *th* in any of the forms of old Cornish, which are *huih*, *hweh*, *whé*, *weh*. It may, however, be an abbreviation of a word mentioned in Pryce's *Cornish Vocabulary*, but omitted from Mr. Williams' *Cornish Lexicon*, whether purposely or not, I am unable to say, viz., *weythaz*, "sixth." (9) *Noun* does not, so far as I know, occur in Cornish, or in any of the other Celtic dialects; so that Mr. Lach-Szyrma's ingenious speculation on this head falls to the ground. The word is simply *naw*. The *n*, it is true, comes out in *noundzhack*, "nineteen," but, on the other hand, it is not found in *nawhuas*, "ninth." The other words explain themselves, as they are simply variations of spelling.

That there are many purely Cornish words still in use among the rural population of Cornwall there can hardly be a doubt; but they are chiefly mining and fishing terms. In the course of preparing a Vocabulary of the living Cornish dialect, in which the lists of Messrs. Couch and Garland, referred to by your correspondent, have been absorbed, as well as all other available sources, I have met with several terms which appear to be peculiar to Cornwall (West). To say, however, as Mr. Lach-Szyrma has said, that *buccaboo* is

pure Cornish, is not correct, as the word, like *lew*, warm, which is also used in Cornwall, will be found to be a common English provincialism. It was only a few weeks ago that Mr. Sullivan, speaking in Parliament on the Irish Peace Preservation Bill, referred to "the *bugaboo* stories of policemen." (See *Times*, March 24.) Halliwell and Brockett's *Glossaries* mention it as being used in the North and other parts of England. In the Eastern counties it is *tom-poker*. As an illustration of the Old Cornish still in use, perhaps you may think the following examples worthy of being mentioned here:—

Bal. A mine.

Boujey. A sheep-fold, from *boudzhi*.

Bulhorn. The shell-snail.—In the West of Cornwall children charm the snail out of its shell by repeating over it the following bit of doggerel:—

"Bulhorn, bulhorn, come out of your corn,

Your father is dead and your mother is born."

Poot. A kick

Scat. A buffet, a slap.

Seaven. The elder-tree.

Tongue-tavas or *tabbas*. A talkative person, from *tavas*, "a tongue," or "language."

Wonders. Numbness of the fingers or toes from cold, from *ewinrew*—*ewin*, "the nails of the fingers or toes," and *rew*, "frost."

It is just possible, however, that some philological expert may find that these words are common enough in other languages.

The following English equivalents of Old Cornish expressions still in use seem somewhat peculiar:—

Black-head. A boil, from Cornish *pedn-diu*, i.e. "black-head."

French-nut. A walnut, from Cornish *kynnyphan frenk*, i.e. "French-nut."

Whitneck. A weasel, from Cornish *codna gwidn*, i.e. "white-neck."

The foregoing examples form but a small proportion of the remains of the ancient language of Cornwall, whose shadow still haunts the nooks and corners of the Land's End district.

WILLIAM NOY.

PHYSIOLOGICAL PSYCHOLOGY IN GERMANY.

Hastings : April 12, 1875.

ONE of the Science notes in last week's *ACADEMY*, which gives extracts from a recent article by Professor Ribot in the *Revue Scientifique*, stating the results of experiments carried on by Fechner and other German *savants* in physiological psychology, is introduced with the remark that these investigations are as little known in England as M. Ribot represents them to be in France. May I be permitted to remind the writer of the note that we are not quite so dilatory in assimilating the products of German research as he supposes? About three years ago I published in the *Westminster Review*, under the title "Recent German Experiments with Sensation," an account of all the facts quoted by the writer of the note, with a good many more besides, pointing out the laws to which Weber and Fechner had been conducted. This paper was reprinted in a volume of essays recently published by me, and was specially alluded to in nearly all the reviews of the work, including that of the *ACADEMY*.

It is, of course, a little disappointing to discover that the results of hard and protracted study—for the unravelling of the argument of a German scientific treatise to one who is neither a German nor a *Fachstudent*, even with the aid of professors' lectures and private explanations, is no child's play—receive so limited a recognition precisely where one would like to find it. But this is comparatively a personal matter. A point of more general importance, suggested by this unnecessary resort to a French exposition of German science, is the absence of everything like a serviceable *rapprochement* between students of psychology and of physiology in this country. The progress of all recent English psychology has been towards

a consistent *pari passu* employment of the subjective and objective methods; and students of mental science are eager to receive from physiological enquirers any new facts which throw light on the precise conditions of mental action. Further, there has recently grown up in Germany a well-defined department of science which specially investigates all the phenomena in which the bodily and the mental are simultaneously observable. This science, one branch of which was carved out by Fechner in his *Elemente der Psychophysik*, which has been enriched by the experiments and reasonings of Helmholtz and others, and which has just been developed into a complete scheme by Wundt in his *Grundzüge der physiologischen Psychologie*, has as much interest for the physiologist as for the psychologist. Much of the subject-matter, moreover, is far more familiar to the physiologist than to the psychologist, and it appears to me that it would be a great gain to both sciences if their votaries would co-operate in the work of recording the progress of these investigations, and of thus contributing towards the construction of a physiological psychology in England.

Possibly before such harmonious action is possible, English physiological students will have to acquire a certain amount of the psychological interest. With one or two brilliant exceptions, they appear to have very little taste for mental problems. This interest has been secured in Germany to a considerable extent by the prevailing subjective tendencies of the German intelligence. Perhaps it may be said that most German thinkers are psychologists *in posse*. The faculty of subjective observation has been greatly favoured in that country by the wide dissemination of philosophic ideas, due principally to the action of the universities, which, through the attraction of wide-famed professors, are able to plant the germs of philosophic thought in the students of all the faculties. Yet over and above these influences, a great stimulus to the study of mental processes by German physiologists has been the discovery that a large number of physiological operations require for their complete explanation the recognition of interfering mental laws. As an illustration of this, I may point to the way in which Helmholtz, in the progress of optical researches, has been forced to investigate the laws of attention.

It is perhaps too much to expect to see in England trained physicists like Fechner, or consummate physiologists like Wundt, or brilliant students of medicine like Lotze, passing into chairs of philosophy, but it is surely not unreasonable to hope that English physiologists will soon cease to look askance at psychology as sprung from the shadowy ancestry of metaphysics, and to recognise how close is her kinship with their own well-established science.

JAMES SULLY.

The EDITOR will be glad if the Secretaries of Institutions, and other persons concerned, will lend their aid in making this Calendar as complete as possible.

APPOINTMENTS FOR NEXT WEEK.

SATURDAY, April 17, 3 p.m.	Royal Institution: Mr. George Smith on "The History of Assyria." II.
"	Crystal Palace Saturday Concert (Wilhelm).
MONDAY, April 19, 3 p.m.	Asiatic.
5 p.m.	London Institution: Professor Bentley on "The Classification of Plants." III.
8 p.m.	British Architects. Medical.
TUESDAY, April 20, 3 p.m.	Royal Institution: Professor P. M. Duncan on "The Grand Phenomena of Physical Geography."
7.45 p.m.	Statistical.
8 p.m.	Civil Engineers. Pathological.
8.30 p.m.	Zoological.
WEDNESDAY, April 21, 1 p.m.	Horticultural.
4.15 p.m.	Royal Society of Literature.
7 p.m.	Meteorological.
8 p.m.	Society of Arts.
"	British Orchestral Society, St. James's Hall.

THURSDAY, April 22, 3 p.m.	Royal Institution: Professor G. H. Seeley on "The Fossil Forms of Flying Animals." II.
4 p.m.	Zoological.
5 p.m.	Zoological Gardens (Davis Lecture): Mr. J. W. Clark on "Sea-Lions."
7 p.m.	London Institution: Dr. Freeman on "The History and Use of the English Language." IV.
8 p.m.	Inventors' Institute.
8.30 p.m.	Royal.
FRIDAY, April 23, 1 p.m.	Sale at Christie's of the Manley Hall Gallery.
2 p.m.	Antiquaries. Anniversary.
8 p.m.	Quekett Club: Dr. D. Moore—"Remarks on <i>Bucrophalus Halmcanus</i> , and an allied unnamed Form."
8.30 p.m.	Clinical.
9 p.m.	Royal Institution: Professor Ramsay on "The Pre-Miocene Alps, and their subsequent Waste and Degradation."

SCIENCE.

Fragmentary Papers on Science and other Subjects. By the late Sir Henry Holland, Bart. Edited by his Son, Rev. Francis J. Holland. (London: Longmans & Co., 1875.)

As the last and well-ripened fruit of a long life of intellectual and social activity, this volume is very interesting, and will not disappoint those who are familiar with the excellent author's former writings. They will find in it the same open-minded, almost judicial, attitude taken in respect to all the chief questions that fascinate and baffle the mind of man, and will have pleasure in renewing their contact with a thinker whose interests took so wide a range, and who seemed compelled to sympathise even when he condemned. We feel we are reading the book of a man who had many friends, and who deserved them; to whom no one who was endeavouring to tread with honest steps an arduous path would have looked in vain for an appreciation not only kindly but sincere. Those who have the good fortune to be looking back upon the intellectual struggles and triumphs of the last half century will probably read these papers with most interest; but those who stand at the commencement of the next stage of the journey might possibly find in them not less profit. Of the feebleness of age there is not a trace; but of its special wisdom there is much.

Sir Henry briefly maps out the achievements of Science in more than one of its departments, but always with his eye fixed upon the limits of its advance. One point he will never suffer the reader to forget, that all attained knowledge of phenomena and laws lies within a wider sphere which it fails to illuminate; and the darkness of which he thinks it desirable that we should always keep in mind. Yet the tone of the volume is by no means depressing; it is indeed even enthusiastic, even juvenile in its buoyancy. In the review of Mr. Marsh's book on *Nature and Man*, for example, recounting what man has done to modify the physical world, the reader cannot but feel the vivid pleasure with which the manifold additions to human well-being are recounted, and the largeness of the expectation in which the future is embraced.* Indeed Sir Henry expresses, or seems to express, an opinion

* It is worth noticing that so wide a traveller states that, even in Europe, one-half the total area of the land is covered still with forest.

that is not often heard; namely, that the power of the human intellect has increased since the brightest periods of the past:—

"It cannot be doubted that the powers as well as attainments of certain European peoples in our own age have reached a higher grade than those of any other time or people in the anterior history of the world. . . . Germs of thought and speculation which failed to ripen in the philosophy of the older time have now matured into established truths. What were conjectures have become laws, and it is in the discovery of these laws that we obtain evidence of the highest capacities of man."

Is the evidence sufficient to establish this fact? It might be of the utmost importance for the estimate of the future. Are the greater practical achievements of the modern age evidences of greater, or only of better directed, intellectual power, than that of which we have evidence in the past? Yet, on the other hand, is it certain that any advance in properly intellectual power beyond that indicated, not only in Greek literature, but in writings still further removed, is even desirable for men? Does not a truer application of power include all that we can suppose likely to serve our well-being? Would not greater powers mean harder tasks undertaken, and then what gain—the proportion of success and failure remaining unchanged? Would man be really better off if the strength of the human body were increased? Or would a few giants help us perceptibly? What we need rather is to know more and more how to use Nature's powers for our own behoof, and persuade her by our obedience to fulfil our ends.

We have been led by our author's enthusiasm into a digression. Yet it is not quite alien from the main subjects of this volume. For perhaps this thought in Sir Henry's mind, that man's achievements, past and future, are to be regarded as in direct proportion to his power, rather than as expressions of the truth or falsity of his method of using it, casts a certain shadow over his anticipations of success in some directions: in those, for instance, which refer, not to the ultimate nature of things indeed, but to the laws and methods of man's perception, the deeper sequences which his consciousness obeys, and the real meaning which should be given to such terms as matter and force. Here our author lets fall a sort of pall upon the imagination, which may, perhaps, be partly due to a false estimate of the way in which human advance is made; that is, to his ascribing it too much to increase in power, and too little to a better direction of a power which remains the same. If science has been made by men no greater in intellectual power than Greeks, or even Hindoos, Hebrews, nay Chinese (which we venture to hold as the better interpretation of the evidence),* then successors of these modern men, no greater than they, may accomplish things as much more wonderful than our science, as our science is than that which went before. Granted, though men may grow clever enough to discover the laws of matter, yet they will never grow clever enough to solve what matter is, or force.

* Take Confucius, Sakya Muni, and Isaiah, for examples.

We may be pretty sure of this. But if the new reading of Nature that Science gives us—the fresh light that renders quite luminous questions that before seemed fatally and for ever dark, even to the wisest men—be due not to increasing power, but simply to truer methods (toward which former errors were essential steps), then why may not the past be yet again repeated in the future; and still truer methods bring within the power of men achievements which seem to us demonstrably hopeless?

Thus, to take one point which evidently fascinated our author with a strong attraction: the origin of matter. He says (p. 316):

"Take the old question regarding that very Matter itself, which we are now so boldly handling, through the properties of its ultimate atoms and molecules. Is it actually created? . . . or is it in itself eternal? It is obvious that reason is vainly spent in seeking to encounter a question where, *though one of the alternatives must necessarily be true*, no proof or argument can possibly be brought to determine which is so."

And again (p. 220), he speaks of "the invisible powers that cause the things we see." Here it is obvious to remark that the question is not truly put. What we have to ask is not about "matter," but about our perceiving matter. When we adjust it so, and ask why men have the perceptions on which the term matter is based, it is obvious that the conditions are changed. We may not be able to answer it, but the reasons adduced by Sir Henry Holland do not any more apply. It is not true to say that "no proof or argument can possibly be brought." The question covers more of the humble ground of fact, and so is accessible to proofs and arguments which were not available before; and it abstains from assumption (namely, from assuming the cause of our perceiving to be "matter"), and so does not close up avenues of enquiry which otherwise remain open. Sir Henry's method of putting the question, on the one hand, does not begin at the beginning; overlooking the fact that it is not matter, but our perceiving, which is the problem presented to us; it does not cover the ground; and on the other it involves an assumption which is none the less gigantic because it has been so natural to make it: namely, that we can at once put that which answers to our consciousness as if it were its cause; an assumption which experience every moment is denying.

Now it would be irrelevant to point out that thus taking up the true question given to us by experience in respect to matter—viz., What is the real significance of our perception of it—the path of enquiry is by no means blocked up, but abundantly open, at least at present; because, for instance, we may look into the qualities that we include in the term matter, and examine whether some of them are not demonstrably referable to certain conditions affecting ourselves; and so have their basis, not in the cause of perception, but in the perceiver. But it is not irrelevant to insist on this general point, because perhaps, more than any other single characteristic, it gives a tone to this volume. The pervading caution—wise and true and needed as it is—in respect to enquiries passing beyond the limits

of man's power, is throughout deprived of part of its value by this incomplete apprehension of the real nature of the problems, and needs a readjustment in the mind of the reader before it can be more than a vague, and therefore probably ineffectual, check. But there are parts of this volume to which there are not even such slight drawbacks as this. The essays devoted to Literature are only too short. That on History, with its suggestion of comparing equal times in different histories, with the view of guarding against false perspective, is full of interest. Indeed, Time seems to have occupied much of Sir Henry Holland's thought, as readers of his former works remember. The consideration of time as an element especially in all mental processes, and as a means of constantly applying Leibnitz' Law of Continuity, receives here many valuable applications.

JAMES HINTON.

Marsden's Numismata Orientalia. New Edition. Part I. Ancient Indian Weights. By Edward Thomas, Correspondant de l'Institut, &c. Royal Quarto. (London: Trübner & Co., 1874.)

WHEN William Marsden wrote his book in the first quarter of this century, he little dreamed that its moderate size and homely style would ever develop into the magnificent "get up" and elaborate composition of the "tall" edition now before us. We do not, however, wish to lead any reader into believing that there is a single word or touch of Marsden's own in the first part of the new edition. The old numismatist let the subject of the present essay alone, and we think judiciously. The field is, therefore, entirely free for Mr. Thomas so far as any anticipation on the part of the original author of the *Numismata Orientalia* is concerned.

After an introduction, which is mainly occupied with the relation between Egypt and India in the question of priority of metric system, we arrive at Chapter I., which is headed "Weights and their corresponding Measures," a heading which sufficiently indicates the subject of the chapter. We say it sufficiently indicates the subject advisedly, for no imaginable heading could fully inform us of the contents of any one of Mr. Thomas's chapters. He has brought his extensive archaeological resources to bear upon the main subject and all around it, so that under the heading "Weights and their corresponding Measures" the reader will find, not only a full and minute investigation of the origin and nature of the ancient Indian systems of weights and measures, but also lengthy parentheses—ethnological, palaeographical, philological, and otherwise. Chapter II., "Money under its Historical Aspect," deals chiefly with the indications—or what Mr. Thomas deems to be indications—of monetary currency in the Vedas, Menu, and so forth. Chapter III., "Coins Proper as distinguished from Bullion," is a description of the well-known punch-marked coins; and Chapter IV. is an appendix, designed to prove the author's estimate of the *rati*.

Mr. Thomas finds in one of the hymns of the Vedas a reference to "ten purses," and

in the succeeding verse to "ten lumps of gold," which seems certainly to show that money in some defined form then existed. But we cannot see that Mr. Thomas has proved that this metallic exchange, whatever it might have been, was actually a stamped coinage. Nor do we see that the later authorities he adduces prove this point. But even if the antiquity of the art of coinage in India were granted, it is difficult to see how it is to be shown that the punch-marked coins, for which Mr. Thomas claims this antiquity, were the currency referred to, or supposed to be referred to, in the old Indian writings. At the same time it must be admitted that the discovery of much-worn punch-marked coins buried along with comparatively new-looking Greek coins of Antimachus II., Philoxenes, Lysias, &c., goes some way towards rendering Mr. Thomas's view probable. It seems indeed to be the only argument of any weight which Mr. Thomas has been able to bring forward in support of his theory.

The numismatic interest of the work, of course, centres upon chapters ii. and iii. But the numismatic element is by no means the sole, perhaps scarcely the most important in the essay—a portion of the *Numismata Orientalia* though it be. The value of the metric discussion in the first chapter is very great, and the varied archaeological information, to which we have already adverted, scattered throughout the book, forms an exceedingly interesting feature. It is true there is sometimes too much of this discursiveness, as when we find six of these royal-quarto pages devoted to the investigation of various alphabets, or when a reference to "Professor Tyndall's 'dust'" brings in a footnote with a quotation from *Fragments of Science*, entirely irrelevant to Indian weights or Indian anything. It may, indeed, be doubted whether in a scientific work such as the new Marsden is expected to be, any introduction of general antiquarian topics is not out of place. But this depends upon the view we take of the object of this particular essay or of the forthcoming Coin-Cyclopaedia in general, whether it should be strictly scientific or to some extent popular. Either way, whether in place or out of place, this archaeological discursiveness is equally agreeable. In a study like numismatics, which is not always of absorbing interest, it is natural and pardonable if a writer bolts through any loophole that may offer itself, into the wide fields of general archaeology; and many a numismatic essay would be unreadable if the author did not occasionally become restive and bolt.

We wish, however, that the author had given a little time to dressing his facts and theories in a more intelligible language. We confess to having in some places experienced considerable difficulty in arriving at his meaning. The scarceness of his time, mentioned in the preface, must, however, plead as an excuse. It is also to be regretted that in the present essay use has not been made of modern German authorities on metrology: we need only mention the name of Brandis to show the loss Mr. Thomas has experienced in not consulting the works of his German Mitarbeiter.

The work, however, whatever its defects

in these respects may be, carries with it the authority of Mr. Thomas's name, and the interest of his wide reading and extensive learning.

STANLEY LANE POOLE.

SCIENCE NOTES.

PHYSIOLOGY.

On the Mechanism of Suction.—Mezger (*Pflüger's Archiv* x., 2 and 3) points out that the mouth is kept closed, not by the action of the muscles connected with the lower jaw, but by atmospheric pressure. This statement is confirmed by Donders, who investigates the phenomenon experimentally. A manometer communicating with the space between the tongue and hard palate shows, when the mouth is kept shut, a negative pressure corresponding to 2-4 millimetres of the mercurial column. There are two suctorial spaces in the mouth; the principal one is bounded by the tongue below, the hard palate above, and the soft palate behind; the other is situated between the tongue and the floor of the mouth. The former is used in sucking liquid through a straw; the latter (sometimes) in smoking. Both are employed when we endeavour, with the mouth closed, to extract a foreign body from between the teeth. The mouth may be shut during sleep, when the muscles of mastication are relaxed. If a man fall asleep in the sitting posture with his mouth open, his jaw drops; the tongue not being in contact with the hard palate, the suctorial space is obliterated; the soft palate no longer adheres to the root of the tongue; and if respiration be carried on through the mouth, the muscular curtain begins to vibrate, and snoring is the result.

Effect of Oxygen on Temperature and Circulation.—It has often been asserted, though without sufficient proof, that breathing oxygen quickens the action of the heart and raises the temperature of the body. This assertion has been subjected to investigation by Naoumoff and Bieliaief (*Journal de l'Anat. et de la Physiol.*, 1875, No. 2). They found that the prolonged inhalation of pure oxygen exerted no appreciable influence either on the pulse or on temperature. The experiments were made on dogs and on the human subject.

Vaso-dilator Action of the Glossopharyngeal Nerve.—Two years ago it was shown by Vulpian that certain fibres of the chorda tympani nerve were able to cause dilatation of the blood-vessels in the mucous membrane covering the anterior half of the tongue. The same observer has now discovered (*Comptes Rendus*, February 1, 1875) that the glossopharyngeal nerve stands in a similar relation to the mucous coat of the posterior half of the dorsum of the tongue. Electrical stimulation of the peripheral extremity of the divided nerve causes intense congestion of the mucous membrane on one side of the base of the tongue, between the epiglottis and the circumvallate papillae. The epiglottis itself remains pale. The congestion gradually subsides and may be reproduced at will by a renewal of the stimulation. Further experiments were made to show that these vaso-dilator fibres are proper to the trunk of the glossopharyngeal, and not derived from any of the nerves with which it communicates.

Does the Nucleus take an Active or a Passive Part in the Division of Leucocytes?—This question cannot easily be answered by watching the colourless corpuscles in mammalian blood, or in that of the frog; in the former, the nuclei are not apparent till after the corpuscle is dead; in the latter, they can only be distinctly seen when the surrounding protoplasm has spread itself out into a film. In the leucocytes of the axolotl, however, the nuclei are large and well-defined, and the transparency of the protoplasm offers no hindrance to their continuous observation. Availing himself of this circumstance, Ranvier (*Archives de Physiologie*, Janvier-Février, 1875) has satisfied

himself that the movements which the nucleus undergoes, and its occasional fission, are wholly passive phenomena, determined by the activity of the perinuclear protoplasm.

On the Existence of Special Motor Centres in the Cerebral Convolutions.—From their well-known experiments on the brain, Fritsch and Hitzig inferred the existence of special motor centres localised in the cortical substance of the hemispheres. This inference is criticised by Hermann (*Pflüger's Archiv* x., 2 and 3). The combined muscular movements, excited by electrical stimulation of the convolutions, demand currents of great relative intensity for their production. How can we be sure that these currents are strictly limited to the portion of brain matter between the electrodes? If they are not thus limited, the phenomena may be really due to the accidental stimulation of centres more deeply situated. Hitzig endeavours to meet this objection by insisting on the fact that very slight changes in the position of the electrodes suffice greatly to modify the results produced; a degree of localisation decidedly adverse to the possibility of any escape of current into deeper parts. It is argued by Hermann that if the movements be really due to stimulation of special centres situated in the convolutions, the destruction of the corresponding portion of grey matter must necessarily be followed by an absence of the motorial phenomena when stimulation is repeated. Accordingly, having determined the limits of a cortical area whose excitation gave rise to a special aggregate of muscular contractions, Hermann destroyed it with acids, or removed it altogether. The result of these operations was invariably negative. The same combined movements were produced on stimulation, and without any increase in the strength of the currents needed for their production. Moreover, those animals which survived the operation were found, after the lapse of fourteen days, to have entirely recovered from the paralytic troubles immediately consequent upon the lesion. Had a motor centre been extirpated or destroyed, no such speedy recovery could have taken place. Hermann accordingly decides against the existence of special motor centres in the grey matter of the convolutions, and attributes the phenomena observed by Fritsch and Hitzig to accidental stimulation of those deeper centres which have long been known to exist. He does not seem to be aware of the previous researches of Dupuy or of Sanderson on this subject; the latter observer showed (*Proc. Roy. Soc.*, June 11, 1874) "that the superficial convolutions do not contain organs which are essential to the production of the combinations of muscular movements now in question." Further, that it is probable "that the doctrine hitherto accepted by physiologists—that the centres for such movements are to be found in the masses of grey matter which lie in the floor and outer wall of each lateral ventricle—is true."

On the Propagation of Contagion by Flies.—The transmission of malignant pustule from diseased to healthy oxen by means of the blow-fly (*Musca vomitoria*) has long been held to be possible; inasmuch, however, as the proboscis of this fly is incapable of penetrating the skin, its intervention does not suffice to explain the communication of the disease to animals whose skin is unbroken. Méguin (*Journal de l'Anat. et de la Physiol.*, No. 2, 1875) shows that other flies, armed with penetrating weapons, are in the habit of attacking both sick and healthy animals, and thus serve to inoculate the latter with contagious matter derived from the former. The epizootic of Condrieux, in which a number of cattle were rapidly destroyed, was attributed to the punctures of a species of *Simulium*; the symptoms were those of malignant pustule; but it was not suspected at the time that these insects only acted as carriers of the virus from infected to healthy organisms. The account given by Livingstone of the Tse-tse fly (*Glossina morsitans*), whose sting is fatal to horses, oxen, sheep and dogs, while it

is relatively harmless to unweaned calves, pigs, wild animals, and children, is irreconcilable with what we know of insect poisons, and can only be explained by supposing that the proboscis of the fly is charged with a specific virus derived from some animal labouring under a contagious malady.

ASTRONOMY.

Catalogue of Red Stars.—In the *Vierteljahrsschrift der Astronomischen Gesellschaft*, Professor Schjellerup gives a list of red stars revised to the present time, with all the information collected about these objects since his first list, compiled eight years ago from all sources then available, drew special attention to this class of stars. Great interest attaches to the red stars from the circumstance that many of them have been found to be variable, while their spectra are generally channelled, belonging to Secchi's third or fourth types—stars at a low temperature having compound molecules in their atmospheres. The stars in Schjellerup's list (400 in number, 120 being recent additions) have been noted as strikingly red at various times and by various observers without any systematic examination of the heavens having been made for this special purpose. If this were done, it would probably be found that there are thousands of such objects among the stars of the sixth magnitude and under.

Temperature of the Sun.—Mr. Langley, the director of the Allegheny Observatory, has undertaken the investigation of the relative temperatures of different parts of the sun's surface, and as a preliminary step has verified the discovery, made by Professor Henry in 1845, that the nucleus of a spot radiates less heat than the neighbouring surface, and has also examined the statements made by P. Secchi that the heat from the sun's limb is only half of that from the centre of the surface, and that the equatorial regions are hotter than the polar. After some trials of lenses of rock salt, Mr. Langley was compelled to fall back on an ordinary refracting telescope of thirteen inches aperture, notwithstanding the disadvantage of a great absorption of the ultra-red heat-rays by glass. By suitable lenses the sun's image formed by the object glass was enlarged to a circle two feet in diameter, and a thermopile composed of sixteen pairs of very small elements (antimony and bismuth) was placed in various parts of the image. The thermopile was connected with a Thomson mirror-galvanometer, which shows by the motion of a spot of light, reflected by the mirror carried by the needle, the passage of an electric current resulting from a slight difference of temperature in the two faces of the thermopile. To guard against disturbance from hot or cool currents of air, the thermopile was enclosed in a double cylinder containing water at a constant temperature. With this arrangement Mr. Langley found that, though the nucleus of a spot was much cooler than the surface surrounding it, there was no great difference of temperature between it and the photosphere near the sun's limb, though the difference in brightness is so considerable. In fact, with a larger image of the sun and more perfect apparatus, it was established that the relatively black nucleus actually radiates more heat than the bright photosphere quite close to the limb. Following up this discovery, Mr. Langley was able to show that the absorption of light, both in the case of a spot, and of the parts of the sun's surface near the limb, is not accompanied by a corresponding absorption of all the heat-rays (invisible as well as visible), so that, taking Sir W. Herschel's estimate of the brightness of the nucleus as $\frac{1}{1000}$ of that of the photosphere, Mr. Langley finds that we receive from a spot fifty times as much heat as light, and a similar conclusion is arrived at with reference to the surface near the limb, though the disproportion between the heat and light is in this case not so marked. These results were obtained by exposing the thermopile for equal times to the

radiations from certain selected parts of the sun's image, and noting the deflection of the galvanometer in each case. Mr. Langley also compared the equatorial and polar regions, but found no appreciable difference in the heat received, and he concludes that there is now no such difference as Secchi announced in 1852. Mr. Langley's paper is given in two recent numbers of the *Comptes Rendus*.

Structure of the Sun.—In the *Memorie degli Spettroscopisti Italiani*, Mr. Langley gives the result of an examination of a fine sun-spot in December, 1873, accompanied by a beautiful drawing in which the filamentous structure both of the penumbra and umbra is well shown. These filaments were disposed in curves, showing on the whole something of a spiral arrangement, and had this remarkable property in common, that they were all brightest at the tips as if they curled upwards, rising partially above an absorbing medium. The same tendency was also noticed in the nucleus, which, though relatively black, was found, when the light of the photosphere was cut off, to be of a brightness insupportable to the unprotected eye. Though the filaments or plumes exhibit a certain analogy to crystalline forms (especially snow or ice crystals), they resemble so closely, when examined under high magnifying powers, the filaments or jets of hydrogen in the chromosphere, and also certain forms of cirrus in our own atmosphere, that Mr. Langley is inclined to refer them to this type, more especially as there is some difficulty in conceiving, even on the sun, crystals more than 10,000 miles long by 5,000 thick. The general conclusions at which Mr. Langley arrives support M. Faye's theory that spots are caused by cyclones on the sun, rather than P. Secchi's, which explains the nucleus of a spot as a sort of stagnant pool of cool vapours, depressing by their weight the general surface of the sun. Mr. Langley also considers that if a liquid or viscous solar shell exist, it must be at a very considerable distance below the photosphere.

The November Meteors.—M. Arcimis, at the Cadiz Observatory, observed the Leonid meteors on November 12, 13, and 14 last, noting forty-four in all, of which six were red, and the remainder white; ten of these showed an ordinary continuous spectrum, in two the red and yellow were brightest, and in one the red, yellow, and green were conspicuous. Fifteen left a perceptible train behind, showing bright rays in the red, yellow and green in two instances, in the red and green in a third, in the yellow and green in another, and in the green only in another, besides which there was one pale spectrum without rays, and nine continuous.

Spectra of Stars.—Professor d'Arrest continues in the *Astronomische Nachrichten* his list of stars of Secchi's third and fourth types, the spectra of which are channelled, indicating combination of the elements at a comparatively low temperature, a view which is supported by the fact that these stars appear to be in general at a red or yellow heat. Out of 11,000 stars examined by Professor d'Arrest only eighty of the third type and five of the fourth were found, the sole difference between the two types (which are classed together by Vogel) being, that in the third type the bands are sharp on the blue side, fading away toward the red, while in the fourth the reverse is the case. On one or two occasions M. d'Arrest was able to separate these bands into fine lines, but this was only in the case of bright stars of the third type; the variable star, R Leporis (Crimson star), exhibited at its maximum a fine spectrum of the fourth type, but it was then only of the $7\frac{1}{2}$ magnitude. Several stars with large proper motion were examined for signs of strong absorption, but nothing peculiar was noticed. It is worth mentioning that Professor d'Arrest, on two different occasions, discovered Uranus by its remarkable spectrum, which is quite different from that of any star examined hitherto.

Coggia's Comet.—Mr. Tebbutt, at Windsor,

New South Wales, followed this comet up to October 7, when it was an excessively faint object and very much diffused. With six months' observations of this comet in one or other hemisphere a good orbit ought to be determined, though the result arrived at from the northern observations, that its period was very long, will hardly be affected.

MICROSCOPIC NOTES.

MR. DALLINGER and Dr. Drysdale have just communicated another paper to the Royal Microscopical Society on the life-history of certain monads found by them in a maceration of cod's head kept for a long time. It seems that, although the first organised bodies seen in putrefying infusions consist of well-known forms, others of more remarkable character appear in the course of weeks, and months, their development probably depending upon temperature, food supply, &c. The last forms described by the above-named observers they call *calyciform monads*. They are somewhat calyx-shaped, thinning out to a sharp tail at one end, and having at the broader and mouth end four long flagella. They multiply by fission, the details of the process being very remarkable, and also at times by a true sexual process. The bodies of the creatures ready for the generative action become amoeboid, and put out blunt prolongations. When two meet, they coalesce, and form round masses from which myriads of extremely minute germs issue and soon assume the parental form. These germs appeared barely visible with a magnification of 1,800 diameters, and required for their definition 2,500 diameters, obtained with Powell and Lealand's one-fiftieth.

The authors, in reviewing the series of their investigations, comment on the very high temperatures which the germs resulting from sexual conjugation were able to resist. They found these germs, or spores, had a heat-resisting power greater than their adult forms in the proportion of eleven to one; the actual temperatures they withstood being in one case as high as 300° Fahr., and in another 260° Fahr. There is no reason to suppose that the germs they have detected and watched in development are the smallest that are produced, and we are led to the conclusion that no negative evidence can justify a positive affirmation that no germs exist in any given fluid. The paper of Messrs. Dallinger and Drysdale will be published entire among the Transactions of the Royal Microscopical Society, in the *Monthly Microscopical Journal*, and taken in connexion with their previous contributions, must be regarded as among the most valuable and instructive studies of minute life made for many years.

THE minute objects connected with fermentation give rise to interminable controversies, and M. Pasteur's theories have again been assailed. He maintains the alcoholic fermentation to be a consequence of life without air, or free oxygen. Any cellule, he says, that can accomplish chemical work without setting in action free oxygen, soon occasions the phenomena of fermentation. In other words, fermentation is the result of a mode of life, nutrition, and assimilation differing from ordinary modes by the fact that the combinations produced by free oxygen are replaced by the heat of the decomposition of substances containing oxygen in combination. These substances are fermentible bodies. This theory of fermentation was suggested by researches into butyric fermentation, and chiefly by the circumstance that the butyric ferment is a vibron, capable of multiplying indefinitely without air. He states that in reply to the criticisms of Liebig he offered to prepare, in his presence, a considerable weight of vibrons without any other nitrogenous matter than what could be obtained from a salt of ammonia and crystalline mineral matters, and without any carbonaceous substance but the fermentible matter. Liebig refused to concur in these and similar experiments

before a Commission of the French Academy, although that body undertook to defray all the expenses. Recently, Dr. Oscar Brefeld, of Wurzburg, has made experiments which seem to contradict M. Pasteur's theory. He considers that yeast will not grow in the absence of free oxygen. In 1874, M. Moritz Traube, of Breslau, made similar experiments, and found that yeast would develop, as stated by M. Pasteur, in the absence of free oxygen, but that it would only give rise to a feeble fermentation, acting upon the albuminous matters present, and not decomposing the sugar. MM. Brefeld and Traube each published statements affirming the accuracy of their results. M. Pasteur then resumed the investigation in the following way.

He took a glass globe holding several litres, and having two tubes proceeding from it—one drawn out and bent, to carry away the gaseous products of fermentation; the other straight and united by a stopcock of glass to a small cylindrical vessel. The globe was filled with yeast-water and sugar, and boiled to expel the air, the efferent tube being plunged in a similar boiling solution, which was kept in ebullition during the cooling of the globe and its liquid contents. When the cooling was finished, the end of the efferent tube was plunged in mercury, and the entire apparatus placed in a stove at a temperature of 20° to 25° C. Experiments made with the carmine of indigo decoloured by M. Schutzenberger's reagent, hyposulphite of soda, showed that the liquid contained no trace of oxygen. A fermentation was then set up in the small cylinder with a little beer-must and sugar, taking care that the yeast contained no germs of other ferments. When the fermentation was in good action, the stopcock was turned, and a few drops allowed to run into the globe, after which the tap was shut. In these conditions the yeast added to the fermentible liquid deprived of air, though in quantity infinitely small and imponderable, developed in accordance with M. Pasteur's former experiments, contrary to those of M. Brefeld; and the fermentation continued to its completion, contrary to the statements of M. Traube.

M. Pasteur asks, how could such able observers, anxious only for the truth, be so deceived? M. Brefeld, he thinks, operated with yeast that was too old, as only young yeast will multiply without air. M. Traube, he considers, did not take care that the yeast should be absolutely pure. The presence of other ferments complicates the phenomena and suspends the action of the yeast.

M. Pasteur calls one sort of organism *aerobies* which require air in order to live; and another sort *anaerobies* which can do without it, although capable of using it. When the latter are supplied with oxygen they join the *aerobies*, and are no longer ferments; and when the *aerobies*, which are notably the moulds (*moisissures*), are so placed that they have to grow without a sufficient supply of free oxygen, they become ferments, precisely to the extent they accomplish chemical work without free oxygen:—

"The theory of fermentation will be mathematically established on the day when science can show the relation between the quantity of heat taken up by the yeast living in the absence of air, and the quantity of heat furnished by the combustions that take place when the life of the yeast is maintained with free oxygen in greater or less abundance." (*Comptes Rendus*, February 22, 1875.)

M. J. B. SCHNETZLER states that a solution of borax kills both animal and vegetable protoplasm, and preserves meat from putrefaction. It arrests rotation in vegetable cells and soon kills rotifers, entomostraca, and infusoria. It also prevents fermentation. (*Comptes Rendus*, February 22, 1875.)

SOME very curious particulars of the winter life of algae in Mossel Bay, Spitzbergen, are given in *Comptes Rendus* for the same date, by M. Fr. Kjellman. It appears that numerous algae (*Florideae* and *Fucaceae*) germinate actively in the winter

months. Out of twenty-seven species he enumerates, twenty-two were found to be supplied with reproductive organs of divers forms. Some, like *Elachista lubrica*, exhibited them all the winter, but others only for a longer or shorter time during that season. *Rhodomela tenuissima* was at a certain period filled with sporocarps, antheridia, and stichidia. *Chaetopterus plumosa* showed no reproductive organs in October and the beginning of November, but towards the end of that month, and all through December and January, it was furnished with zoosporanges with one or more cells, some full of zoospores, others empty and in process of decay. He gives the mean sea temperature for November, $-8^{\circ}2$ C.; December, $-14^{\circ}5$; January, $-9^{\circ}0$; February, $-22^{\circ}7$. Mossel Bay is in N. lat. $79^{\circ}53$, E. long. $16^{\circ}4$, and the sun, allowing for refraction, descends below the horizon on October 20, not to reappear till February 21. Nevertheless the dark period only lasts three months, as some days before the solar disappearance, and also before its reappearance, for at least six hours it is light enough to see surrounding objects.

THE *Proceedings of the Royal Society*, No. 159, contains a paper by Dr. Carpenter, reviewing the arguments concerning the foraminifera called Globigerinae. He says, "that the Globigerinae not only live, but propagate, at the sea bottom, is indicated by the presence of enormous multitudes of very young specimens in the water immediately overlying it." He adds that, though in earlier stages they are inhabitants of open water, "they sink to the bottom on reaching adult age, in consequence of the increasing thickness of their shells, and they propagate there (whether by gemmation or sexual process is not known), and the young rising to the surface repeat the same history." "Very thick-shelled specimens are only known as brought up from the sea-bed."

WE have received a letter from Dr. Wallich referring to our remarks (March 17) on Professor Leidy's paper in *Silliman's Journal* for January 7, 1875, on an *Amoeba* which appeared to correspond with Dr. Wallich's *Amoeba villosa*. Dr. Wallich, who has sent us copies of his papers, says: "I feel sure that Professor Leidy has quite unintentionally ignored my observations, and will be ready to acknowledge the oversight if you will allow me this opportunity of bringing it to his notice." We gladly do this, and advise all students of rhizopods and amoeboid forms to avoid publishing any supposed fresh discoveries until they have referred to Dr. Wallich's researches (*Annals Nat. Hist.*, April, May, June, August, November, and December, 1863, and March, 1864).

AN encouraging Report has just been issued by Mr. Henry Willett, of Brighton, as honorary secretary of the Sub-Wealden Exploration Committee. It was on February 11 that the new boring at Netherfield was commenced, and by the end of March the diamond-mounted borer had drilled a hole 373 feet deep. The present area of the bore is $5\frac{1}{2}$ inches, and the hole is lined with 6-inch tubes to a depth of 206 feet. The cores of solid rock now being brought up are seven or eight feet in length, and give the geologist splendid opportunity of studying the strata passed through. At the base of the gypsum-beds of the Purbeck series the explorers reached a large cavern, and then, passing through the sands and sandstones which are supposed to represent the Portland beds, they reached the well-known Kimeridge clay, in which they will probably continue for some time to come. The Report contains a daily record of the work by the superintendent, Mr. Thornton; a notice of the Spenberg boring in Prussia, by Mr. F. W. Rudler; and a page in memory of Sir Charles Lyell, by Mr. H. Willett.

MEETINGS OF SOCIETIES.

MUSICAL ASSOCIATION (Monday, April 5).

Mr. A. J. ELLIS, F.R.S., in the Chair. After the preliminary business, Dr. Stainer was called on to read his paper on Musical Notation, which had been announced. The substance of the paper was as follows:—

It is desirable that the principles on which notation is based, and especially the weak points of the ordinary notation, should be studied; they have not received sufficient attention from musicians in general.

The notation of music may be compared with that of written language. Primarily we have to represent in language, articulation; in music, pitch. The pitch is disregarded in the notation of ordinary speech. The Hebrew accents, subsequently developed into a complete musical notation, are supposed to have been originally indications of the inflexion, or pitch, of ordinary speech. The only instance of any such indication in ordinary use now is the underlining of words (use of italics); this indicates a modification of the pitch of the voice.

The notations for musical pitch may be divided into three classes—alphabetical; imitative; and by the ladder. The alphabetical system reached its highest development among the Greeks; in their modes every note was indicated by its proper letter. The principal example of this class at the present day is the Tonic Sol-fa system, which Dr. Stainer calls "the letter notation."

The imitative class has practically disappeared; this is, where the ups or downs of the pitch are indicated, either by lines drawn up or down—this is believed to be the origin of accents generally, and of the Hebrew musical notation in particular—or by up or down movements of the hand of the director; this is believed to be the origin of certain signs in use in the music of the Greek Church.

The ladder system is that in ordinary use: if there was nothing but absolute pitch to be indicated, it would be far the best; but for many purposes the indication of relative pitch is important; and this is the strong point of the letter system. Absolute pitch is, in the ordinary system, represented by a clef. The only exception is where a tenor part is written in a treble clef. Mr. Oliphant's proposal is worthy of general adoption, that tenor parts, when written in treble clef, should have the G clef doubled. This would render the practice consistent. In the letter system the signs express notes by their relation to any key-note; the name of the key-note is printed as an additional direction; and to get the absolute pitch of the note intended, both letter and key note must be taken into consideration. It follows that persons who have an acute sense of absolute pitch, as it is called, cannot read easily from the letter system: (This is one of the most remarkable questions in music that remain untouched by theorists. Some musicians, generally of the first rank in musical power, read by remembering the actual sound of the notes, i.e. the absolute pitch, and with these the sense of key relationship is subordinate to that of absolute pitch. Others do not possess the knowledge of the absolute or actual sounds of notes, but estimate them by reference to any arbitrary key-note which may be given. No physiological explanation has been given of this sharply marked division: Helmholtz does not allude to the point.)

In the indication of note relationship the position of the two systems is reversed; the letter system has the advantage that the same symbol always represents the same note of the key; while the indication of intervals in the ladder system depends on a scheme of some complication, involving the variable signature and unexhausted accidentals, which has to be carried in the mind. It may be laid down that the necessity for carrying anything in the mind is a bad thing.

In the indication of time the ordinary (ladder) system has the advantage. As a detail, in analogy to the sequence semibreve-minim, where a plain oval is followed by a tailed oval, it would be better if the first blotted note (crotchet) were a plain blot, not tailed; this would save one tail throughout the series of quavers.

In the representation of minor keys both systems have great faults. There ought to be a means of representing the leading note of the minor key as part of the key.

The best notation for voices is not necessarily the best for instruments. Transposition gives no trouble to voices singing by interval from a letter notation; it would be difficult for instruments.

Printed examples of a proposed notation were then exhibited. It is equivalent to the ordinary notation; but the signs (a) and (b) are dispensed with, the corresponding indications being furnished by modifications in the form of the notes.

On the conclusion of Dr. Stainer's paper, Dr. Stone remarked that it was difficult to believe in the perception of absolute pitch, for absolute pitch differed at different epochs. Mr. Bosanquet said that absolute pitch as here used only meant the actual pitch of the notes commonly employed; and, after remarking that there was much yet to be said on the theory of the subject, indicated the nature of a notation for equal temperament. Dr. Monk thought it was a mistake to suppose that there was nothing to be carried in the mind in the letter notation. Dr. Pole remarked on the advantage of the ordinary notation for reading score without performance, and asked whether this was possible with Tonic Sol-fa. Mr. Macnaught said that it was easy; and as easy to read a Sol-fa orchestral score as a psalm tune. Mr. Hullah said that a great number of notations had been proposed within the last fifty years, but he was happy to say that no two of them were alike. He was of opinion that much of the difficulty attributed to the notation lay in the music itself, and that the accidentals were an advantage, and not a difficulty. Mr. Sedley Taylor combated this last position. Mr. G. A. Osborne expressed himself strongly as to the high merit of the notation proposed by Dr. Stainer. Mr. Mackeson thought the difficulties of the ordinary system were overrated. The Chairman (Mr. Ellis) said that the inflexions of speech belonged to a subject that had been long his special study, and he did not believe that the difficulty of reducing them to notation could be overcome at present. He then gave an account of several systems of musical notation which had possessed more or less celebrity, and remarked that Dr. Stainer's proposed system was not an equal temperament one. Dr. Stainer replied, and the meeting terminated. At the next meeting (May 3) Mr. Bosanquet will read the second part of his paper on Temperament, and will exhibit to the Association a small enharmonic organ, which has been built expressly for the occasion.

SOCIETY OF BIBLICAL ARCHAEOLOGY (Tuesday, April 6).

S. BIRCH, LL.D., President, in the Chair. The following papers were read:—1. "Description of Lady Tite's Tablets;" and, 2. "On an Ancient Assyrian Sword of the Fourteenth Century B.C.," by George Smith. 3. "Revised Translation of an Obscure Passage in the Great Astronomical Work of the Chaldeans," by the Rev. A. H. Sayce, M.A. The writer explained that, in continuation of his studies upon the early Babylonian Astronomical Tablets, he had ascertained that certain characters were not to be read, as heretofore, phonetically, and therefore the passage in question, which occurs at the close of the first Tablet of the Astronomical Cyclopaedia, must be read:—"The star (Jupiter) rises, and its rising like the day is bright, in its rising like the blade of a double sword a ring it forms." This would refer to the streak of light thrown by the rising planet upon a misty atmo-

sphere. 4. "On a Digraphic Inscription found at Larnaca," by D. Pierides. The inscription, which is unfortunately much mutilated, is properly to be called digraphic, as the language is the same throughout, only written in Greek and Cypriote characters respectively. It appears to have been a votive inscription incised by the order of "Stasias, the prince, son of Stasicrates, King of Soli, both of whom it mentions. Beside the digraphic texts there are the remains of a later Greek inscription, which is nearly unintelligible. 5. "On the Four Races in the Egyptian representations of the Last Judgment," by E. Lefébure.—This paper was chiefly an account of several Tableaux which occur on the famous Sarcophagus of Seti I. now in the Soane Museum. The text, here translated for the first time, consists of the addresses of the representatives of the four divisions of mankind to the deity Ra at the entrance of the *ker neter*, and of his several replies to them. The progress of the deity along the heavenly Nile is then related, and the rewards of the justified are ascribed to them.

ROYAL MICROSCOPICAL SOCIETY (Wednesday, April 7).

THE President, H. C. Sorby, Esq., F.R.S., in the Chair. A paper on "Further Researches into the Life History of Monads," by Mr. W. H. Dallinger and Dr. Drysdale, was taken as read, after a brief statement of its contents by the Secretary. It was ordered to be printed in the *Monthly Microscopical Journal*, and a discussion upon it will take place at the next meeting, May 5. Some of the facts mentioned in this paper will be found under the head of "Microscopical Notes."

The President read an elaborate paper on "The Use of the Microspectroscope," describing the apparatus employed and the indications obtained. He advised the use of a binocular microscope for many objects, and showed the position of the prisms and the illuminating apparatus required for this purpose. To explain the character of various spectra, he employed a drawing of the solar spectrum to which moveable representations of absorption bands could be attached. He found that the positions of those bands were best registered by using the quartz plate he recommended long since, though for special purposes Browning's micrometer was very efficient. The wave lengths at the centres of each band should be noted, and he intended to publish charts which would make this easy. When a substance gave several absorption bands, it was important to observe the numerical relations of their several wave lengths, and what displacements, or changes, took place upon the addition of acid or alkaline reagents, oils, &c. Many illustrations were given to show that these relations of wave lengths in the various spectra afforded indications of chemical constitution, the presence of particular substances, and the molecular conditions of the bodies examined. It would be impossible to do justice to the paper by a brief summary, but it will be found when published in the Society's *Transactions* to be a most important contribution to the study of molecular physics as well indicating new methods of analysis. Mr. Sorby announced that he would exhibit and explain his methods at a scientific evening, to be held by the Society at King's College on the 21st inst.

NEW SHAKSPEARE SOCIETY (Friday, April 9).

A. J. ELLIS, Esq., in the Chair. The names of a dozen new members were announced. Miss L. Toulmin Smith read a paper on the story of the bond in the *Merchant of Venice*, which she had found in the *Cursor Mundi* of the end of the thirteenth century, earlier than any appearance of it in English hitherto noted. She traced its recurrence in various versions, down to the time of Shakspeare.

Mr. James Spedding's paper "On the Corrected Edition of *Richard III.*," was read by Mr. Fur-

nivall. Mr. Spedding's object was to establish, as against the editors of the Cambridge Shakspeare, that the version of the play in the first folio is the genuine work of Shakspeare. Its defects, he urged, are due either to the carelessness of printers, or to their difficulty in reading a manuscript which had undergone many corrections. The other differences between the folio and quarto are such as may reasonably be attributed to a revision by Shakspeare himself, and it is needless to suppose the existence of a transcriber "who worked in the spirit, though not with the audacity, of Colley Cibber."

Mr. Matthew gave an account of a paper on the same subject in the Year-book of the German Shakspeare Society, by Professor Delius, who was present at the meeting. Professor Delius, while recognising the folio as the genuine text, does not believe that it was ever revised. He looks upon it as representing (printer's errors apart) the original text of Shakspeare. The first quarto, he thinks, was printed from an imperfect copy, obtained by underhand means, and dressed up for publication by some unknown person.

Dr. Nicholson gave some instances from the quartos of *Henry V.* of the manner in which texts were mutilated in their passage through the press. He did not, like Professor Delius, think it improbable that Shakspeare should have revised and altered his work.

After some remarks by Mr. Pickersgill, who dwelt strongly on the faulty readings of the folio as compared with those of the quarto, Mr. Aldis Wright said that the choice between the different texts of Shakspeare was a difficult matter. He read a part of the preface to the play in the Cambridge edition to show that the editors had not spoken with over much confidence. He could not believe that Shakspeare had gone through his work, altering a word here and a letter there, as Mr. Spedding represented him; he was quite sure that a large majority of the quarto readings were preferable to those of the folio, and were therefore Shakspeare's.

Professor Delius's paper on the Quarto and Folio of *King Lear* was taken as read.

ROYAL ASTRONOMICAL SOCIETY (Friday, April 9).

PROFESSOR CAYLEY, one of the Vice-Presidents, in the Chair. A paper by Lord Lindsay was read, in which the author gave an account of his careful determination of the longitude of Mauritius in connexion with his expedition to that island to observe the transit of Venus; and Sir George Airy then described briefly the operations for fixing the longitudes of the stations in Egypt (which had served Lord Lindsay as a starting-point), the stretch from Cornwall to Alexandria (3,200 miles without a break) being the longest yet accomplished, and the determination probably the most accurate hitherto made. Mr. J. M. Wilson communicated a paper on the relative motion of the two stars of 61 Cygni (remarkable for their large proper motion and comparative proximity to us), the result arrived at being essentially the same as that obtained recently by M. Flammarion, though the two investigations were quite independent. While modifying the direction of motion found by Struve from early observations, Mr. Wilson considers that there is no sensible deviation from a straight line. Mr. Proctor sent a note on Transit of Venus Photography in reply to Captain Abney's comparison of the English and American methods, the point urged being that in the former the scale of each photograph cannot be determined. Sir George Airy objected to the introduction of such irrelevant matters as reports of conversations into a scientific paper, and expressed his opinion that Mr. Proctor's note had not added anything of value to the state of this question. In fact Mr. Proctor's objection appears to be founded on a complete misapprehension of the means available for determining the scale of photographs whether taken by the

American or the English method. Captain Noble announced that having had another opportunity of looking at Uranus he found it had returned to its original hue.

ROYAL GEOGRAPHICAL SOCIETY (Monday, April 12).

THE paper read last Monday was an account of Mr. John Forrest's journey across the centre of Western Australia. Sir Henry Rawlinson, in his opening remarks, observed that Mr. Forrest had travelled to the south of the line followed by Colonel Warburton, but the two accounts of the country corresponded fairly one with another. It forms a vast plain, covered with spinifex and almost entirely devoid of water. This circumstance impeded the progress of the travellers, and occasioned much suffering both to them and the horses, several of which died *en route*. About 129° E. longitude, and in the neighbourhood of the Musgrave Range, the country improves, and not far from here the travelling party crossed the routes of Messrs. Giles and Gosse. Several attacks were made by natives on the explorers, who were compelled on one or two occasions to use their rifles in self-defence.

The Chairman said that Mr. Forrest's journey, though it lay through a most inhospitable region, was important, as it was something to find that the country was not available for agriculture or colonisation.

Sir George Bowen, Governor of Victoria, then addressed the meeting in a most humorous speech, and remarked on the fact that he knew nothing of West Australia, but had been for sixteen years on the eastern side. He was of opinion that the heat of the western part of the island of itself would form no obstacle to sheep-farming, as it was predicted that this would be found to be a hindrance to the growth of wool at Geelong, and yet there were now 6,000,000 sheep there. He had had the pleasure of dining with the Messrs. Forrest at Melbourne, and found that their privations and difficulties had not made much impression on them, as they were both in excellent preservation.

Mr. Markham then read an abstract of a paper on the overland route from Pangrani to Mombasa, on the East Coast of Africa, by Mr. New, a missionary, who has since succumbed to a severe attack of dysentery. Neither this paper nor a short account of the progress of Colonel Gordon's expedition on the Upper Nile, calls for any remark.

ANTHROPOLOGICAL INSTITUTE (Tuesday, April 13).

COLONEL A. LANE FOX, President, in the Chair. Professor Rolleston, M.D., F.R.S., read a paper on "The People of the Long-Barrow Period." The author commenced by stating that it was on all hands acknowledged that the Long Barrows were the oldest existing sepulchral monuments in Great Britain. He then proceeded to point out: 1. The evidence existing that enabled him to divide the Long-Barrow period into three epochs. In the earliest epoch the dead were interred unburnt in chambers; i.e., in graves, walled with upright flags, and communicating with the exterior. In those chambers was found the greatest amount of discoloration from oxide of manganese. In the second period the dead were still interred unburnt, but in cists, i.e., in closed stone receptacles, not intended to be re-opened, and having no gallery leading to the exterior. The third epoch was distinguished by the practice of cremation, which might be supposed to link the Long and Broad Periods together. 2. The evidence for accepting what might be termed the Ossuary theory, for explaining the appearances met with in the Long Barrows rather than the theory of successive interments, as put forward by Professor Nilsson, or the theory of human sacrifices, as proposed by the late Dr. Thurnam. 3. The evidence as to the mode of life prevalent in the Long-

Barrow Period which the cranial and other bones of the persons burnt or buried in them furnish.

Mr. Bertram F. Hartshorne exhibited and described objects of Prehellenic age from Troy.

ROYAL SOCIETY (Thursday, April 15).

THE following papers were read:—"On the Development of the Teeth of Fishes, Elasmobranchii and Teleostei," by C. S. Tomes; "Researches on the Specific Volumes of Liquids. I. On the Atomic Value of Phosphorus," by T. E. Thorpe.

FINE ART.

TAPESTRY OF ARRAS AND LILLE.

Les Tapisseries d'Arras, Etude artistique et historique. Par M. le chanoine E. van Drival. viii and 196 pages. 8vo. (Arras, 1864.)

Les Tapisseries de Haute-lisse : Histoire de la Fabrication Lilloise du xiv^e au xviii^e siècle, et Documents inédits concernant l'Histoire des Tapisseries de Flandre. Par Jules Houdoy. 160 pages. 8vo. (Lille, 1871.)

Tapisseries représentant la Conquête du Royaume de Thunes par l'Empereur Charles-Quint. Par Jules Houdoy. 34 pages. 8vo. (Lille, 1873.)

VERY little has yet been published concerning the history of the manufacture of tapestry during the Middle Ages. M. van Drival's volume is, I believe, the first attempt at a history of the Arras manufacture, and as such presents a certain interest. Its value is, however, diminished by two great defects: first, the entire absence of new matter,* the book being made up from materials already in print, no doubt diligently got together, but without any discrimination as to the relative value of the sources quoted; secondly, the author's strong local prejudices, which often lead him to claim for his native town the manufacture of works that were undoubtedly executed elsewhere, such as the eight pieces representing the History of Gideon and his Fleece (p. 100), made at Tournay by Robert Davy and John de l'Ortye after the cartoons of Baldwin of Bailleul; the well-known Glorification of Justice, belonging to Charles the Bold (pp. 107-114), now at Berne; and the series executed at Brussels after Raphael's cartoons (p. 154). The volume would have been of far greater interest if M. van Drival had given us a collection of authentic documents from the archives of Arras.

M. Houdoy's excellent books leave little to be desired either in their matter or their get up. He has set to work in the right way, and having carefully gone through the town accounts of Lille from 1317 to 1792, and a number of other registers and papers, he has extracted everything he could find concerning the manufacture of tapestry in that town. The materials thus collected form the groundwork of his books, into the text of which are woven such documents, or portions of documents, as appeared to be worth publishing, these being printed verbatim, the remainder analysed or merely mentioned. Undoubtedly this is the right system, and it is to be hoped that some one will

* Perhaps a safe-conduct granted in 1543 by Charles V. to several citizens of Arras is here given (p. 165) for the first time.

do the same at Arras, Tournay, Bruges, Brussels, Audenaerde, Alost, Louvain, Antwerp, Mechlin, Ghent, Enghien, Binche, Ath, Valenciennes, and Bethune; then, and not until then, will there be a sure basis for writing a history of the manufacture of tapestry in the Low Countries.

When, in 1367, the magistrates of Lille determined on making a present of tapestry to Charles V. of France as a token of gratitude for the reunion of their city to the county of Flanders, they entrusted its execution to one Vincent Bourselle, of Arras; hence one may fairly conclude that there was at that date no manufacturer of note at Lille. Indeed, there is no proof of tapestry-weavers being established in the town until thirty years later, in 1398; this, however, is nearly a century earlier than the date given by M. Derode in his *History of Lille* (vol. i. p. 352). The first tapestry weavers mentioned as having settled in the town were natives of Arras; later on, in 1412, we find others coming from Saint-Denis and from Paris. In 1424, the local magistrates, for the first time, purchase tapestry made at Lille. In 1460 there occurs an entry in the town accounts of a payment, annually renewed, for the hire of tapestry cartoons and tapestry to adorn the Halles on the day of the procession and festival of the Behourt. In 1468, we find Charles the Bold giving orders for the execution of tapestry to two manufacturers at Lille. In 1476, one Peter Dujardin, found guilty of having substituted linen for silk thread in a piece of tapestry made by him, a fraud denounced by the authorities of the corporation as likely to injure the reputation of their manufacture, was condemned to go on a pilgrimage to S. Mary Magdalene at La Baume, in Provence, and on his return from thence to Utrecht; he was, however, allowed, in lieu of the former, to pay for six thousand bricks to be used in the fortifications of the town. Another fraud was the use of paint to heighten the effect of tapestry, such tinting being permitted by the regulations of the corporation to be applied only to the faces, hands, and bare flesh. The fraud gave rise to great complaint, and led to the issue of a decree by the Governor of the Low Countries, strictly prohibiting any such tapestry being sold, or exposed for sale, under pain of confiscation. This decree was not publicly proclaimed, but, to avoid scandal, was in each town communicated by the magistrates to the master tapestry-weavers, who were called together to hear it read. Thus we know that there were at Lille, on March 15, 1539, twenty-six master tapestry weavers, but no dealer in tapestry, which the manufacturers at that time sent to Antwerp to be sold. The weavers, it seems, accused the dealers of being the parties guilty of practising the fraud of tinting. Another malpractice of the dealers was changing the marks, for all tapestry made in the Low Countries bore on the border either the mark or name of the weaver, and the arms or other mark of the town in which it was executed.

In 1544, Charles V. issued a uniform code of rules for all the corporations of tapestry weavers in the Low Countries, of which M. Houdoy gives a careful analysis. He omits, however, to mention that before drawing up this code Charles appointed a commission

to examine and consult the principal weavers of each town, and there can be little doubt that the Lille records, just as those of other towns, mention this.

M. Houdoy occasionally goes beyond the limits he had at first proposed, and gives unpublished notes concerning tapestry executed in other towns. One of them (p. 67) informs us that a series of ten pieces of tapestry, representing the defeat of the Spanish Armada by the English and Dutch under Lord Howard in 1588, was executed by Francis Speering after the designs of Henry Vroom, of Haarlem.

The art of weaving tapestry appears to have died out at Lille about 1580, and was not revived until 1625, when Vincent van Quickelberghe, of Audenaerde, settled there, after having made an unsuccessful attempt to establish himself at Arras. In 1634, Caspar van Caeneghem, of Audenaerde, removed to Lille with eighteen workmen. Their work, however, does not appear to have been of a high class; George Blommaert of Audenaerde, who settled in Lille before 1677, but removed to Beauvais about 1684; the Pannemackers, from Brussels, 1684 to 1750; John de Melter, of Brussels, and his son-in-law, William Wernier, 1688-1778; and Francis Bouché, 1740-1768, were the best makers at Lille in their time. Five pieces by the last-named weaver, representing the story of Venus, are in the possession of Captain Leyland.

The last Lille manufacturer was one Stephen Deyrolle, who stopped working about 1782. His descendants were employed in the royal manufacture of the Gobelins.

M. Houdoy's second pamphlet relates to the twelve celebrated pieces of tapestry representing the conquest of the kingdom of Tunis by Charles V., executed 1549-1554, by William Pannemaker, of Lille, after the cartoons of John Vermay, of Brussels, designer of the well-known tombs in the church of Brou executed for Margaret of Austria. The contracts, published at length, are full of interesting details.

M. Houdoy is mistaken in supposing that no paintings of Vermay's have come down to our time. I believe that the very series of paintings representing the Conquest of Tunis are now in Germany. They were sent to London to be restored some years ago, and permission was then obtained, through the late Prince Consort, to have them photographed, and a copy of the series is preserved in the Print Department of the British Museum. W. H. JAMES WEALE.

THE FRENCH EXHIBITION.

(Second Notice.)

German Pictures.—The leading German contribution is one which is to be seen on the first floor of the Gallery, not mixed up in the general collection, and which is notified to visitors as *The Head of our Saviour, the celebrated painting by Gabriel Max*. Max is a Munich artist, and his picture, as we observe from a selection of press notices, was recently exhibited in Berlin, with high laudation. The treatment is peculiar. The head of Christ is simply the head and face, without anything else whatever; and it is shown as if lying or impressed upon a smooth napkin of Egyptian byssus-linen or mummy-cloth, slightly blood-stained and

deceptively painted. We may thus regard it as a "Veronica" or true impress of the face of Jesus, as miraculously left visible upon the kerchief presented to him (so the legend runs) on his way to crucifixion. A second peculiarity is that the eyes are represented as closed, but are so managed that at a few paces' distance they produce the effect of being opened, and gazing upon one with a kind of ghostly or ecstatic fixity. This is effected by painting the upper curve of the closed lids very dark, the under curve rather less dark, and the circle below the eye somewhat darker again. Such an expedient might possibly be justified by some truly extraordinary success in its result upon the spectator's feelings; short of this, it must be pronounced a trick, and, in the ratio of its ineffectiveness, a poor or wretched trick. We think it here deserves at any rate the name of "trick," without damnable epithet annexed. The mouth of the Saviour is closed, the hair droops in lank curls, as from prolonged exhaustion and distress, a tear trickles on the left cheek, the crown of thorns binds the forehead. The expression is one of benignancy, suffering with calmness, and is so far approvable; the face has an adequate share of physical as well as moral beauty. Its great defect is that the personage represented seems to be a very ordinary being: placid, and below the average of mankind in power. This can never be right: the head of Christ ought at all events to indicate, whatever else may be suggested or omitted, a personal ascendant and spiritual energy capable of becoming the leverage of a world. Gentleness, humility, or dejection, may form the expression of the moment, but not the basis of the character. Doubtless, however, many religious as well as many aesthetic observers will be found to admire Herr Max's representation with something like enthusiasm. Its general scope is more analogous to that of Ary Scheffer than of other painters; but in Scheffer, notwithstanding his defects, there was more of grave internal perception—more of conviction realised to his own mind, and partly translated into his work—than we find in the present well-skilled production.—*Maternal Cares*, by Professor Sohn, with true action in the cradled baby, casting its eyes upward and backward towards its mother, and reaching its unraised arms in the same direction, is a pleasant picture, elegantly handled. We like it better than *The Happy Mother*, by F. A. Kaulbach, an out-door scene; though this also is entitled to not dissimilar terms of commendation. *A Veteran* is well painted by Professor Schaus: he is seated on a stone bench, in some public garden which we might suppose to be that of Munich, for instance, or of the Luxembourg, and dozes, dreaming perhaps momentarily on and off of long past years of toil, requited with some modicum of honour. *The Zither-Player*, by Defregger, is a clever piece of peasant-life; the meditative black-and-tan bow-legged terrier, or otter-dog, which listens with lightly-drooped eyes marking the connoisseur, being particularly good. A somewhat similar point may be noticed in another very talented work, the *State Secrets* of Laupheimer. It is difficult to understand why the place of honour, facing the door, has been accorded to so commonplace a piece of artistic man-millinery as *The Startled Fawn* of Professor Hoff. Von Poschinger treats with marked ability the rainy riverside of *Starnberg*: the drenched heaviness of colour is well developed.

Flemish Pictures.—*Mourning*, painted as far back as 1862, is a laudable specimen of Israels—in all respects more solid than some of his performances of recent years. Israels is the painter of death in the lower ranks of society, and especially of their unpompous *pompes funèbres*: and this theme he can treat simply and touchingly, though the frequent repetition of it necessarily leads towards the sentimental, and at last the flimsy and conventional. Here we find a mother and daughter holding the last mournful and trying vigil by a

coffin, beside which a single taper burns: the night is now wearing late, and ushering in the distressful and unforgettable dawn. The elderly mother, holding a devotional book in her hand, half hides her face; the child gazes forward with duller sadness. *Les Premiers Pas*, by Blommers, is natural and broadly painted—not first-rate, yet well up in the secondary rank of domestic painting: his *Washing-day* is equally meritorious. *The Invalid* is a characteristic piece by Mesdag—an old fishing-boat hauled up for repair on a snowy beach.

British Pictures.—Mr. J. L. Brown, Mr. Wylie, and Miss Montalba, are all, we believe, British by nationality or by domicile, but more or less foreign in training or descent. *Outside Paris*, 1870, by the first named, is a snow-scene by sunset, painted with considerable effect. *Morning Prayer, Normandy*, by Mr. Wylie, a church-interior with various peasant-figures, stands well amid subjects of its class; and the two companion-pictures by Miss Montalba, each of them named *The Lagune, Venice*, with broad-sailed fishing-craft, the first under brightly-coloured sunshine, the second in greyish daylight, are clever and pleasant in no common degree.

French Pictures.—Several of these were reviewed in our first notice; but a few remain over for mention. *Misery and Splendour*, by Duez, are about the largest works in the room, and are already familiar to visitors of the Parisian Salon. *Misery* is embodied in an aged *chiffonnière*, who has been good-looking in her remote day, and who plods through the snowy streets and under the dense grey atmosphere, picking up what she can get: an outworn pair of pink satin slippers is her last find. This is painted with ample force and dexterity; and, considering its purposely squalid subject-matter, deserves credit for not pushing the miserable into the absolutely ignominious. *Splendour* is a young lady, rather perchance of the *demi-monde* than the *grand-monde*, with yellow hair, dark eyes and eyebrows, and a diligently composed complexion, in rich winter-costume, with one gloved hand, and one ungloved holding a minute white lapdog; she appears to be re-entering her mansion, but, save the figure itself, all the rest of the canvas is an indefinite ground-tint. This painting is no less tellingly skilful than its companion. M. Billet, already named in our first notice, contributes besides a large picture of *Tobacco-Smugglers, Poland*; clever in motion and in painting, though hardly so much to our taste as the two peasant-subjects which we had specified. *Le Satyr en Famille*, by Priou, is a lively and not unimportant work, of average artistic pretensions. We shall conclude by naming, as also worthy of remark—Corot, *Evening Repose*; Chevreillard, *Un Piquenique manqué* (a curiously repellent subject of a *curé* who, coming with a lobster to regale with a parishioner, finds the latter dead in his chair), and some others; C. F. Daubigny, *Lake Guillemin, Normandy*; Jacque, *Sheep going to the Meadows*; Mauve, *The Towing Path*; Rousseau, *The Evening Glow*; Madame Collart, *A Farm in the Black Forest*; Bague, *The Model's Opinion*, a studio incident.

THE CONDUIT STREET GALLERY.

THIS spacious gallery opened on the 12th instant with "an exhibition of Loppé's Alpine Pictures, and of other modern British and Foreign Pictures." M. Loppé is a Genevese painter, and honorary member of the Alpine Club, whose works have of late attracted much attention in England from mountaineers and critics. The pictures by him now on view are, with here and there an exception, the same which were displayed last year: one of the very large ones, named *Ascent of Mont Blanc*, is new. Ice-peaks and glaciers are his most characteristic subjects. Considered as representations of awfully sublime scenery, hardly to be explored or portrayed by painters, his works have been very generally allowed to rank

high for truthfulness and impressive force; considered strictly as works of art, they may be said to show adequate learning and accomplishment, with direct unpeccable execution, and a laudable freedom from trickiness, but also without any marked display of those higher qualities of imagination and subtle as well as vigorous realisation which could only be obtained at the hands of a very admirable artist. Besides a considerable display of Loppé's works, the gallery contains several pictures (the total number of entries in the catalogue is 102) by various other painters, and of miscellaneous subject-matter. Most of these have probably been seen before, here or elsewhere. We may specify—Fortuny, *Cavaliers*; Meissonier, *Le Sommeil*; Edwin Ellis, *After Sundown*; Roybet, *An Algerine*; Sir H. Thompson, *Study from Nature and Still-life*; Schreyer, *Russian Waggon*; Basil Bradley, *The Victor and the Vanquished* (cattle subject); C. E. Johnson, *The First Snow* (a Welsh or Scottish mountain scene, which certainly compares advantageously, in its strictly pictorial aspect, with the Loppé specimens); Munkacsy, *Rôdeurs de Nuit* (a powerful work, lately exhibited in Paris); Sir R. Collier, *On the Mer de Glace* (a smallish canvas closely resembling Loppé in subject-matter, and again losing nothing by the comparison); Boughton, *The March of Miles Standish*.

W. M. ROSSETTI.

ART SALES.

THE Art season has been, and promises still to be, extremely noteworthy for sales of water-colours. Mr. Leaf's sale is still in prospect, and among the sales that are past Mr. Quilter's must now be added to Mr. Greenwood's. The Quilter collection, which was dispersed under the hammer of Messrs. Christie during the last three days of last week, was of comparatively recent formation. Only about sixteen years ago, we understand, did Mr. Quilter begin to collect. The comparatively short space of time that had elapsed between commencing the collection and dispersing it did not prevent Mr. Quilter from realising enormous profits at last week's sale. Indeed no time of equal brevity could ever, in the whole history of Art, have been more productive of favourable change in the value of art-property. The David Cox drawings—the most considerable part of Mr. Quilter's collection—fell under the hammer on Thursday. There were 114 of these, of all periods of the artist's work, from the *Bridgenorth Bridge*, an unusually favourable example of his earlier style, to the *Hayfield*, a very famous example of his later. And they were of all degrees of finish and importance: from the slight sepia sketch to the largest water-colour. *Bridgenorth Bridge*, which we have instanced as an admirable example of Cox's earlier work, sold for 101l. 17s. *The Hayfield*, the object of a spirited contest between Mr. Addington and Mr. Agnew—sold to the latter for 2,950l. Among other important works of David Cox sold the same day, may be mentioned *Crossing the Sands*, 189l.; *Crossing the Moor*; a *Man Ploughing*, 188l.; the *Pass of Glencoe*, 178l. 10s., and *Man on Horseback, crossing a Moor*, 252l. Among the most poetical of all the artist's works was *Bolton Park on the Wharfe*, sold for 220l. 10s. *Beaumaris*, engraved in Roscoe's *North Wales*, and again for the Art Union, and much remarked at the Burlington Fine Arts Club Water-Colour Exhibition, in 1871, and at Burlington House, in 1873, was knocked down for 441l. *The Night Train* went for 640l. 10s.; *Deer-stalking in Bolton Park* (from the collection of H. W. Birch) fetched 997l. 10s. Mr. Vokins, the well-known dealer, had originally given David Cox 30l. for it, and it had cost Mr. Quilter—after having passed through other hands—250l. *Hardwick Castle, Windy Day*, fell to Mr. Agnew's bid of 1,008l. *The Vale of Clwydd*, put up at 500 guineas, was knocked down to Mr. Eley for 1,627l. 10s. Some drawings by

i. Cattermole followed these. One of the most important of them was the well-known *Benvenuto Cellini valuing one of his own Works to the Brigands*. It realised 283*l.* 10*s.* *Old English Hospitality* fetched 430*l.* A *chef-d'œuvre* of Prout—*Church of St. Pierre, Caen*—realised 840*l.* This day's sale concluded with the purchase by Mr. Agnew of a large drawing of Fortuny's, *A Moorish Carpet Warehouse*, for 1,470*l.*

The Turners, William Hunt, George Barretts and Copley Fieldings were sold on Friday. Barretts' *Harvest Moon* fetched 104*l.* The highest price realised by a William Hunt was 787*l.* 10*s.* His *Devotion*, which in Mr. Rucker's collection had sold for 500*l.*, now fetched 420*l.* His fruit and flower pieces probably maintained their usual prices, but, it is evident, did not in the main exceed them. The collection of Turners, though numbering a few of his more elaborate works and one or two of his happiest slighter drawings, was not on the whole of remarkable quality, which counts for the fact that the prices realised were not much in advance of those at other sales. His *Leatherhead*, a charming early drawing, sold for 2*l.* His *Sion*—an exquisite later one—sold for the same money, and may be accounted singularly cheap. *Haidelberg* fetched 1,522*l.* 10*s.* The *Norwegian*, put up at one thousand guineas, fell to Mr. Lane at 1,827*l.* 10*s.* It was sold in the Windsor collection some years ago for 400*l.*, but was said to have cost Mr. Quilter 1,500*l.* There were some magnificent examples of Copley Fielding: the most magnificent being undoubtedly *The Moll of Galloway*, which sold for 1,732*l.* 10*s.*

On Saturday, besides the works of certain living artists, there were sold a few drawings by Dobson, Varley, John Sell Cotman, and Bonington—few being among the best of these masters' works. The elaborate and marvellous water-colours of Mr. John Lewis fetched high prices. *1 School at Cairo* fetched 1,239*l.*; *Lilium turatum*, 1,060*l.*; *The Prayer of Faith shall heal the Sick*, 1,176*l.* Mr. Quilter had himself given 1,000*l.* for this picture. But the chief interest of Saturday's sale lay apparently in the De Wints. Mr. Quilter possessed two or three of the most finished works of the artist, and though there are many who hold that De Wint is seen at his very best only in his quick sketches and nature, there are none who will deny the presence of great qualities in his capital works of old last Saturday. There were few of his lighter works last Saturday, but those that were there sold well. A tiny sepia drawing, *The City Basin*, fetched 27 guineas: another in sepia, *Bognor* (engraved, we believe, in the "Southern Coast" series) fetched 17 guineas. A title piece of still life sold for 21 guineas, and a urn-yard subject—originally one of the most perfect of these ever painted by the artist—fetched 80 guineas. Lord Charles Thynne has since written to declare that he possessed this drawing from 1830 to 1873, and that it must have been really retouched after it left his collection. Of the yet more elaborate drawings of De Wint, the *mezzotint*, started at 500 guineas, was knocked down at 905 guineas; and the *Southall, Notts*, realised no less than 1,650 guineas.

MESSES. SOTHEBY, WILKINSON, AND HODGE sold on Wednesday and Thursday week the collection of English pottery and porcelain formed by Mr. John J. Bagshawe, of Sheffield. It contained samples of early Staffordshire wares, Bow, Chelsea, Derby, and other well-known English manufactures, but was principally remarkable for fine samples of Wedgwood, which were numerous and choice—notably a fine plaque of jasper ware, on ground, with the subject of "Diana reclining under the Chase," in bas relief. This brought 171*l.* Another, representing a Bacchanalian sacrifice, by Flaxman, marked Wedgwood and Bentley, 18*l.*; another, with six figures of boys in relief, 14*l.*; a vase of blue and white jasper, with figures of the Muses, 24*l.*; a pair of oviform jasper vases,

with white classical subjects in relief, 30*l.*; a vase of antique form in imitation of marble, 16*l.* 10*s.*; a pair of granite ware vases with handles and festoons, in relief, 39*l.*; a pair of medallions of Dr. Franklin and General Lafayette, 29*l.* Among the examples of other manufactories were a Chelsea figure of Britannia seated on a lion, with trophies, 31*l.*; the same figure standing by a lion, 18*l.* 10*l.*; a Bow figure of a lioness, 8*l.*; a statuette of Kitty Clive in white glazed Bow porcelain, 31*l.*; four Derby figures of children representing the Seasons, with animals at their feet, 13*l.* The two days' sale realised 1,365*l.*

At a sale of sixty-eight modern pictures at the Hôtel Drouot a few days since, the following were among the most important items:—Corot, *Orpheus*, 12,100 fr.; *Sleep of Diana*, 11,000 fr.; *Spring*, 7,200 fr.; Eugène Delacroix, *St. Sebastian*, 17,900 fr.; *Christ on the Lake of Genesareth*, 17,500 fr.: J. Dupré, *The Storm*, 8,100 fr.; *Branch of the Oise*, 7,850 fr.: Fromentin, *The Banks of the Nile*, 13,300 fr.; *Hawking*, 11,000 fr.: Millet, *Death and the Wood-Cutter*, 20,000 fr.; *The Little Gontard Girl*, 18,050 fr.: Th. Rousseau, *The Sun Setting in Sologne*, 24,100 fr.; *Farm on the Bank of the Oise*, 28,100 fr.; *The Gorges of Apremont*, 16,100 fr.: Roybet, *The Page*, 30,100 fr.: Stevens, *L'Inde à Paris*, 8,200 fr.; *The Amazon*, 7,300 fr.: Troyon, *An Osier-Bed*, 24,200 fr.; *White Cow chased by a Dog*, 10,400 fr.; *Pastures near Trouville*, 12,000 fr.

NOTES AND NEWS.

WE hear rumours of a projected exhibition of works of landscape art illustrative of the scenery of the New Forest, to be opened in May next under the auspices of the New Forest Defence Association. This scheme, which originates with a few public-spirited gentlemen, is set on foot with a view to making more widely known the varied and peculiar beauty of this delightful district, which, invaluable alike to all lovers of thoroughly English scenery and English art, is threatened with utter destruction by enclosure, by fire-planting, and by the indiscriminate sale of old historic timber. The exhibition, it is promised, will contain works by Constable, Copley Fielding, Lee Bridell, W. P. Frith, E. G. Warren, T. L. Rowbotham, W. Crane, Nasmyth, Vickers, &c.

WITH a patriotic desire to rival the *Archäologische Zeitung* of Berlin, MM. de Witte and Lenormant have started a new journal in Paris, calling it the *Gazette Archéologique*, the first number of which has just appeared. It is ambitious in the matter of illustrations, printing, and paper, but is least successful where there was most room for improvement, viz., in the illustrations. The two coloured designs from Greek vases, for instance, are of a decidedly inferior order. As regards the text there is only one redeeming article in it, and that is by M. de Witte, on a representation of Dionysus and Silenus.

THE Holbein Society has issued a descriptive account, by Mr. Alfred Aspland, of Burgman's woodcuts, *The Triumph of the Emperor Maximilian I.*, to accompany the facsimile reprints of these designs, on a somewhat reduced scale, that formed one of the Society's preceding issues. Mr. Aspland's account is to a considerable extent translated from the edition of 1793. There is a good deal of curious and serviceable matter in this publication, but the arrangement is somewhat lax and discursive.

THE ancient and interesting church of Bredwardine on the river Wye is about to undergo the perilous process of restoration. It possesses at present many curious features, and among others a Norman doorway of unusual size on the north side of the nave. The tympanum exhibits some rude carving of early date, and in the surrounding wall there are several courses of herring-bone work. A large decorated window in the chancel

has evidently been inserted for the purpose of giving greater light, and perhaps at the same time the narrow lancets were filled in. In the chancel are two remarkable effigies. The earlier and larger figure is imperfect and is somewhat rudely carved out of the local sandstone. It represents a warrior clad in a tight-fitting jupon, beneath which is a hauberk of chain mail extending almost to the knees. A belt ornamented with roses encircles the hips, and from it depends on the right side a dagger, and on the left a sword. The helmet is conical and without vizor, and the gorget of chain-mail is attached to the basinet by staples and lace. The head of the figure rests upon a cushion, at each side of which a winged angel kneels, but neither crest nor plume is visible. It probably represents Walter de Bredwardine, who no doubt was a kinsman of Archbishop Bredwardine, the "Doctor Profundus" of Oxford, the army chaplain of Edward III., and the "bishop Bradwardyn" of Chaucer. The later effigy in alabaster is a very beautiful example of monumental art. The knight is represented as clad from head to foot in plate armour, the arms crossed on the breast, the hands elevated, and the head protected by an open conical basinet. A tilting helmet forms the pillow, and suspended from the neck is the collar of SS. There is little reason to doubt that it commemorates Sir Roger Vaughan of Bredwardine, who married the daughter of Sir David Gam (Shakspeare's Fluellen), and, according to the popular story, saved the life of King Henry at Agincourt by the sacrifice of his own.

THERE has lately been added to the collection of Etruscan antiquities in the British Museum a stone object in the shape, and not much more than twice the size, of a pine cone, with a tenon or plug by which it had been inserted into a base. Round the side is incised the following inscription: *Suses: Velu Sveintu*; or, as Professor Corssen prefers to read it, *Velu Sveintu*, comparing the latter name with the Etruscan Sveitus, Sveitu, Sveitusi, Sveital, Svetin, Sveti, Svenia, and the Latin Suetius, Suetidius, and Suetonius. *Suses* is nom. sing. mas. of a proper name. Compare *Susinal*. Fabretti had published this inscription (Glossar., No. 2327 bis), reading wrongly *Susus*, while again in another place (p. 1724), he reads it *Suses*, without noticing the discrepancy. He reads *Velu Sveintu* as one word, and leaves it alone there, but elsewhere (p. 1718) suggests the division here given.

MR. L. ALMA TADEMA has just completed a very remarkable work. It is in three compartments, and is entitled the *Tragedy of an Honest Wife*. The subject and treatment are poetic in the extreme. Chilperic, King of the Franks, having many wives, made an offer to the father of Brunhild for his younger daughter Galsuinthe, in marriage, pledging himself to dismiss all her predecessors. This he did, but Fredegunda, one of the discarded wives, set herself to win back her lover, and one morning Galsuinthe was found strangled in bed. But when she was buried a great miracle happened, for the lamp over her tomb fell on the pavement, but instead of being broken, the pavement gave way to receive it, and it burned on in the marble. The story is taken from St. Gregory of Tours' *Histoire Ecclésiastique des Franks*. The first compartment shows Fredegunda at her open window, through which she sees Chilperic solemnising his marriage with Galsuinthe under the shade of the four holy oaks. The figure of the disgraced queen is superb. With feline stealthiness, and no little feline grace she sits, half crouching in the darkness of the cushions, glaring out at the glory of her rival. There is tigerish wickedness in the small fierce eyes, straight lips and clenched hand. With wonderful skill the painter has thrown over the whole scene a sense of the singular and terrific age in which the events took place, an epoch of rapid decadence, when in a single generation the gracious civilisation of the most elegant of the Roman

provinces was shattered by the inroads of the Teutonic barbarians. In this mixture of external luxury and personal savagery Mr. Alma-Tadema, always a master of characterisation, has produced another triumph of historical art. To pass rapidly on, the second compartment represents the day dawning after the fatal night. Galsuinthe's head lies back on the pillow, ghastly and grey, her long slim arm, contrasted, it would seem, intentionally with Fredegunda's almost virile development in the former piece, hangs heavily down by the bed. Below her and in front lie two lamps—one is gone out, the other blazes into red strong light. The picture is in deep, and almost lurid gloom, the sole bright point being the dawn-struck cupola of the church outside, pointing at religion as the one light in that dark time. The third division is circular. It represents a monk who, entering the crypt where Galsuinthe lies buried, sees the miracle and worships. The amber lamp, falling on the marble, has not broken or been quenched, but stands embedded in the pavement. It is impossible to dwell here in detail on the charms of these compositions; the colour alone is of the most harmonious and delicate character possible. They are painted in water-colour.

The past few months at Liverpool have been singularly bare of any subject of interest. The Liverpool Art Club has been very prosperous. It has collected an exhibition of Embroidery, containing, among other specimens, the cope left by Henry VII. to Westminster Abbey, then in the hands of the Benedictines, and the Dunstan chasuble, both at present belonging to the Jesuits of Stonyhurst. There were other very valuable ecclesiastical vestments, and the specimens of modern embroidery were also very satisfactory, as testifying to the prevalence of a sound taste which will rapidly render the horrors of Berlin work a thing of the past.

The *Levant Herald* of March 31 states that Sir George Alexander was on his way from England for the purpose of digging out and carrying away one of the obelisks commonly known as "Cleopatra's needles." It is not certain, however, that the Khedive will now allow it to be removed. It was given to the English by Mehemet Ali, who also offered to go to the expense of putting it on board any raft or ship that might be brought, but for some reason it was never taken away. There are two obelisks. One is standing, and the other is lying near covered with rubbish and debris. It is this latter one that Sir George Alexander wishes to take to England. The different estimates given of its weight are curiously divergent, varying from 700 tons downwards. The actual weight of the column must be between 80 and 90 tons; it is 66 feet high, 7 feet 7 inches at the base, cut out of one block of granite. The one that has been erected is rather higher, being 71 feet.

HELBIG, in a tone of amusement not altogether out of place, had published a short article on ancient razors *Im neuen Reich* (1875, i. p. 14), pointing out the absence of them in the oldest tombs of Italy, as in the cemetery of Alba Longa, and comparing this with the frequent occurrence of these crescent-shaped bronze razors in tombs in the islands of the Greek Archipelago, in Attica, Boeotia, in Etruria, and occasionally also beyond the Alps. Since, then, the razor was unknown to the primitive inhabitants of Italy who belonged to the Indo-European race, he argued that the Indo-European race had not of itself known the use of this instrument; but that the various members of this race in Europe had not become acquainted with it till after their final settlement, and then in the course of trade with Egypt and Assyria. But this must have been at a very early period, as may be seen from the reference in the *Iliad* (x. 173), *ἐνὶ θυρῷ ἰστάρῳ ἀκνῆς*. Besides, the upper lip is shaved on the early Corinthian vases. To this theory of Helbig Professor Lignana takes exception (*Bullet-*

tino dell' Inst. Arch. Rom., Jan. and Feb. 1875, p. 16), considering that the words *kaurd* (= *κῆρυξ*) in the Rig-Veda, and *scheere* (= shears) in German are sufficient evidence of the use of the razor having been known to the Indo-European race before its separation. This, however, is assuming that *scheere* had originally meant "razor," which is more than Helbig will allow.

AN exhibition of the "Rejected from the Salon" is threatened in Paris this summer. Considering that over 4,000 works of art have been accepted for the coming Salon, we think the unfortunate public ought to be exempted from any further duties of picture seeing.

THE King of Italy was presented on his birthday, March 14, with the diploma of the Raffaello Academy at Urbino. His Majesty now holds the honourable title of Socio Patrono of the Academy.

PROFESSOR AUGUST WITTIG, of Düsseldorf, has received a commission for a marble statue of Asmus Carstens, to be placed in the hall of the Old Museum at Berlin. His design for the figure is said to be very fine.

A MARBLE statue of the Virgin and Child, supposed to have been executed by the early French sculptor Justus de Tours, has recently been discovered in a château near Orleans, where it has lain unnoticed for years. In the expression of the faces, and the modelling of the hands and draperies, it is stated to bear a close resemblance to the figures on the tomb of Louis XII. at St. Denis, and to the statues assigned to Justus in the Louvre. It is, in any case, a fine work of French art of the sixteenth century, before that art had lost its nationality under the influence of Italy. It has been affirmed that the Louvre had become the possessor of this interesting work, but the *Chronique* expressly states that a M. Ch. Timbal has purchased it. It regrets that the Louvre did not outbid him.

THE distinguished Danish artist Mdme. Jérichau intends, it is reported, to visit England on her way back from Constantinople, where she has been residing for some time.

SEVERAL foreign journals have announced the discovery of a painting of the Virgin and Child by Albrecht Dürer, in the Castle of Glücksberg. The discovery, if indeed it be one, is due in this instance to the German painter Herr Magnussen, who was the first to perceive the merit of this long neglected work. It can scarcely, however, be attributed to Dürer on the verdict of one judge, however competent he may be. We wait for the confirmation of his opinion from critics who have not the enthusiasm of discoverers.

A SHORT autobiography of the German architect and archaeologist, Carl Haller von Hallerstein, appeared in a recent number of the *Kunst Kronik*, communicated by R. Bergau. The Freiherr Haller von Hallerstein is not much remembered at the present day, even in Germany, but his researches among the monuments of Greece entitle him to the consideration of all subsequent discoverers. He was a great friend of our English architect Cockerell, and his portrait appears in Cockerell's work, *The Temples of Jupiter Panhellenius and Apollo Epicurius*. Haller died in 1817, at a little village at the foot of Mount Olympus, where he was prosecuting his enquiries. He wrote his epitaph himself during his last illness. It says: "Traveller, say in Germany that I rest here because I strove after perfection."

THE *Gazette des Beaux Arts* is richer than usual this month both in its literature and art. The first article, by M. O. Rayet, gives an historic and descriptive account of the curious statuettes and other small works of Greek art discovered at Tanagra in Boeotia, many of which have since been placed in the Louvre. Next, under the title "A propos de Corot" M. J. Buisson, who is writing a biography of the great French landscape painter, gives us a few short critical notes on his

style of art. Although we English, knowing Turner so well, cannot join with M. Buisson considering that "Jamais ne s'est vue, en effet, noble intervention de l'homme dans la nature, en France ni en Europe depuis Poussin et Claude Lorrain, ces deux grands maîtres français dont le nom revient à chaque instant sous notre plume, still there are few even of Turner's devotees who will refuse their homage to a painter who undoubtedly interpreted certain peculiar moods of nature with a poetic charm only second to that of the great English master of poetic landscape. A very fine impression of one of Corot's rare etchings called a "Souvenir de Toscane" well illustrates M. Buisson's remarks. The second etching is by Léopold Flameng, a splendid rendering of Murillo's painting of St. Francis of Assisi at the foot of the cross. It illustrates a third article by Paul Lefort on Murillo and his pupils. The pupils are not yet reached, for even in this third long article M. Lefort has only conducted the Spanish master to the moment "où son génie atteint son apogée." M. Walther Fol finishes a short biography of Fortuny. The biography includes a good many letters that will be read with interest not only by the painter's numerous friends and admirers, but even by those unacquainted with his art. It is illustrated by some of his clever sketches and studies of character, and, in the last number, by several reproductions from his effective and remarkable etchings, good impressions of which are already becoming very rare. An etching, also, from the weird picture called *Le Charmeur de Serpents* has been executed by M. Boilvin.

THE STAGE.

THE failure of *Rose Michel* at the Gaiety Theatre, with Mrs. Gladstone as its principal interpreter, was certainly not a thing to be wondered at. Nor does it excite surprise that the piece substituted for it—the well-worn but yet well-wearing comedy of Mr. Boucicault's—should not be found sufficiently attractive, seeing that here, too, the principal part is acted by a lady who, whatever may be her good qualities, is quite unfitted to give it the requisite brilliancy and charm. The management has therefore done very wisely in bringing out a strong bill, by giving no less a piece than the *Tempest* along with Mr. Boucicault's comedy. We could wish Mr. Boucicault's comedy altogether away, however, for the present, as the *Tempest* would then be presented rather less in the light of an after-piece. That it is an extravaganza of a superior kind—affording excellent opportunity for a ballet by the Sisters Elliott—is no doubt true. Still, *London Assurance* is not so well played but that a more prominent place of honour might well be given to the *Tempest*; and the *Tempest* is on the whole sufficiently well played to deserve it. The *Tempest* has been got up hurriedly, and counts among its interpreters few artists of high gifts; but it is acted from beginning to end quite inoffensively and in many parts with discretion. Mr. Osmond Tearle, the young actor who plays a small juvenile hero's part in the ill-fated adaptation of Mr. Blum's piece, must count himself fortunate in appearing in this. His Ferdinand is by no means a ripe or finished performance, but it is promising and graceful. Miranda is played by Miss Ethel Gray, who appears to have been carefully instructed in the part, which she performs with intelligence and care which might carry her safely through less ideal characters, but which leave her unequal to the proper realisation of the heroine of Shakspeare. Nor is Miss West, who plays Ariel, much better suited to a creation of infinite delicacy and untold charm. She is bright, as well as intelligent, but it is obvious that a quite other training than that of most of our actresses is needed for parts like these, which demand either exquisite art or a unique simplicity. Coming to Mr. Ryder as Prospero, we

come of course to an actor more capable of coping with the difficulties of a character. Mr. Ryder's delivery, almost always good, is here of excellent service. Mr. Edgar as Antonio and Mr. Culver as Sebastian do not call for remark. Mr. Hall's Stephano has the merit of moderation in one of those drunken scenes so easily and commonly abused. Mr. Righton puts more of variety and more of invention into his rendering of Trinculo, though his Trinculo is not half as striking a performance as some that he has given us. Mr. Maclean, as King Alonzo, renders another proof of useful versatility. Mr. Cowper appears as Caliban, and demeans himself with care and complete absence of exaggeration: in a word, with something of the art of a practised actor. It may nevertheless be doubted whether he is the ideal Caliban. His make-up suggests the "savage and deformed slave," but hardly the "monster" Prospero considers him. He uses his hands always as hands; never as fore-arms; and altogether gives Caliban a higher place than that which imagination usually assigns to him. Perhaps the make-up is hardly wild enough. The head is unkempt rather than savage: more, perhaps, that of a grimy cobbler out of the Seven Dials than that of the "hag-seed" Shakespeare drew. This, at least, is how it strikes us; it may strike others differently. And on the first night, Mr. Cowper—possibly through inadvertence—did not keep to the words of the text. The changes are not improvements. Are they in any stage version of the play? For

"Then I loved thee
And show'd thee all the qualities o' the isle,"
the actor substituted "best parts of the isle." For
"my profit on't"

Is, I know how to curse,"
he substituted, "my profit is to curse ye." And
again, in the passage,
"Be not afraid; the isle is full of noises,
Sounds and sweet airs, that give delight and hurt
not,"

the "Be not afraid" was omitted. Very likely if we had followed the words of another part as closely as this of Caliban's, as many departures from the text might have been noticed. But any way, this is not as it should be. The performance at the Gaiety is nevertheless upon the whole a creditable one—for one so hastily got up—nor is Mr. Cowper's part in it by any means the least creditable.

LAST evening (Friday), *Mademoiselle Duparc* and *Le Homard* were to be presented for the first time at the Opéra Comique. But the only new thing given at the West End theatres since we last wrote is Mr. Farnie's *Intimidad, or the Lost Regalia*, at the Strand. They are always in good spirits at the Strand, and so can laugh at poor jokes quite as well as at good ones—perhaps, indeed, are more accustomed to that art. There, at all events, there is no "finish of wit" that "belies our gaiety." Everything is accepted there. In *Intimidad*, as is common with Strand after-pieces, there is no story to tell. The author's part in the work is less than it was in *Nemesis*; less than in *Loo*; more than in *Eldorado*. The actors bear the brunt of the battle, but some of them would be none the worse for having more to do. It is a mistake, for example, for Mrs. Raymond's part to be so small a one. The duenna played by her has no chance of action, though in variety of facial expression she is continually ludicrous. Mr. Terry makes much of a popular parody. Messrs. Marius, Cox and Saint Maur bring to the little piece the usual characteristics of their style. Miss Maria Jones appears in it. Miss Lottie Venne is very bright and cheerful. So are the dresses and the music. And so the Strand audience goes home contented.

THE *Little Treasure* is performed at the Haymarket, after the comedy of *David Garrick*. Miss Minnie Walton is the "treasure," and Mr. Lytton Sothern Captain Maydenblush. This is an after-

piece of a sufficiently refined sort, appropriate to the theatre. We have seen it worse played; and better.

MISS ADA CAVENDISH goes to the Gaiety, on Monday the 26th, to play Beatrice in *Much Ado about Nothing* for the space of two or three weeks, probably. Mr. Hermann Vezin, coming back from Manchester, will join her in these performances of Shaksperian comedy.

Rose Michel will be tried at the Standard Theatre the week after next.
